50/100 A Current Sensor

 For the electronic measurement of currents:
 DC, AC, pulsed, mixed ..., with a galvanic
 isolation between the primary circuit
 (high power) and the secondary circuit
 (electronic circuit)

Date: 28.01.2008

Customer: Standard type

Customers Part no.:

Description

- Closed loop (compensation) Current Sensor with magnetic field probe
- Printed circuit board mounting
- Casing and materials UL-listed

Characteristics

- Excellent accuracy
- Very low offset current
- Very low temperature dependency and offset current drift
- Very low hysteresis of offset current
- Low response time
- Wide frequency bandwidth
- Compact design
- Reduced offset ripple

Applications

Mainly used for stationary operation in industrial applications:

- AC variable speed drives and servo motor drives
- Static converters for DC motor drives
- Battery supplied applications
- Switched Mode Power Supplies (SMPS)
- Power Supplies for welding applications
- Uninterruptable Power Supplies (UPS)

Limit curve of measurable current $\hat{I}_p(R_M)$ ¹⁾

@ ambient temperature $T_A \leq 85^\circ\text{C}$

Maximum measuring range (μs-range) ¹⁾

Output current behaviour of a 3kA current pulse
@ $V_C = \pm 15\text{V}$ und $R_M = 25\Omega$

Fast increasing currents (higher than the specified $I_{p,max}$), e.g. in case of a short circuit, can be transmitted because the currents are transformed directly.

The offset ripple can be reduced by an external low pass. Simplest solution is a passive low pass filter of 1st order with

$$f_g = \frac{1}{2p \cdot R_M \cdot C_a}$$

In this case the response time is enlarged.

It is calculated from:

$$t'_r \leq t_r + 2,5R_M C_a$$

I_{0H}: Zero variation of I₀ after overloading with a DC of tenfold the rated value (R_M = R_{MN})

I_{0t}: Long term drift of I₀ after 100 temperature cycles in the range -40 bis 85 °C.

t_r: Response time (describe the dynamic performance for the specified measurement range), measured as delay time at I_P = 0,9 · I_{PNmax} between a rectangular current and the output current.

Δt (I_{PNmax}): Delay time (describe the dynamic performance for the rapid current pulse rate e.g short circuit current) measured between I_{PNmax} and the output current i_a with a primary current rise of di₁/dt = 100 A/μs.

X_{ges}(I_{PN}): The sum of all possible errors over the temperature range by measuring a current I_{PN}:

$$X_{ges} = 100 \cdot \left| \frac{I_S(I_{PN})}{K_N \cdot I_{PN}} - 1 \right| \%$$

X: Permissible measurement error in the final inspection at RT, defined by

$$X = 100 \cdot \left| \frac{I_{SB}}{I_{SN}} - 1 \right| \%$$

 where I_{SB} is the output DC value of an input DC current of the same magnitude as the (positive) rated current (I₀ = 0)

X_{Ti}: Temperature drift of the rated value orientated output term. I_{SN} (cf. Notes on F_i) in a specified temperature range, obtained by:

$$X_{Ti} = 100 \cdot \left| \frac{I_{SB}(T_{A2}) - I_{SB}(T_{A1})}{I_{SN}} \right| \%$$

ε_L: Linearity fault defined by $e_L = 100 \cdot \left| \frac{I_P}{I_{PN}} - \frac{I_{Sx}}{I_{SN}} \right| \%$

 Where I_P is any input DC and I_{Sx} the corresponding output term. I_{SN}: see notes of F_i (I₀ = 0).
