

# ABC600 Series

## AC-DC/DC-DC Open Frame Power Supplies

The ABC600 Series of open frame power supplies feature a wide universal AC input range of 90 – 277 VAC, offering 600 W of output power in a compact footprint.

The high efficiency and high power density of the ABC family ensures minimal power loss in end-use equipment, thereby facilitating higher reliability, easier thermal management and meets regulatory approvals for environmentally-friendly end products.

ABC Series power supplies are ideal for telecom, datacom, industrial equipment and other applications.

### Key Features & Benefits

- 600 W standard, 420 W convection cooled
- Size: 5.0" x 8.0" x 1.6" (127.0 x 203.2 x 40.6 mm)
- High efficiency up to 94.0%
- Universal input voltage range: 90-277 VAC
- Active power factor correction
- Less than 5 W dissipation at standby mode
- Parallel operation with active current sharing
- Digital control for circuit loop and power management
- Fully protected (OTP, OCP, OVP, SCP)
- Power Management Bus for control, programming and monitoring
- Both AC input and DC input are available
- Designed to meet Class B per CISPR 22 and EN 55022
- Approved to the latest edition of the following standards: UL/CSA60950-1, EN60950-1, and IEC60950-1
- CE marked LVD

### Applications

- Instrumentation
- Lighting
- Industrial Applications
- Applied Computing
- Datacom
- Renewable Energy
- Test and Measurement
- Robotics
- Wireless Communication
- Process Control

## 1. MODEL SELECTION

| MODELS                        | OUTPUT VOLTAGE (VDC) | MAX LOAD CONVECTION | MAX LOAD 300 LFM | MINIMUM LOAD | RIPPLE & NOISE | TOTAL REGULATION |
|-------------------------------|----------------------|---------------------|------------------|--------------|----------------|------------------|
| ABC600-1012G                  | 12 V                 | 35.0 A              | 50.0 A           | 0 A          | 1%             | ± 2%             |
| ABC600-1015G                  | 15 V                 | 28.0 A              | 40.0 A           | 0 A          | 1%             | ± 2%             |
| ABC600-1024G                  | 24 V                 | 17.5 A              | 25.0 A           | 0 A          | 1%             | ± 2%             |
| ABC600-1028G                  | 28 V                 | 15.0 A              | 21.4 A           | 0 A          | 1%             | ± 2%             |
| ABC600-1048G                  | 48 V                 | 8.8 A               | 12.5 A           | 0 A          | 1%             | ± 2%             |
| V <sub>fan</sub> (all models) | 12 V                 | 1.0 A               | 1.0 A            | 0 A          | 1%             | ± 20%            |
| V <sub>sb</sub> (all models)  | 5 V                  | 1.0 A               | 1.0 A            | 0 A          | 2%             | ± 2%             |

### NOTES:

1. Peak current rating on V1 (main output) is 120% of max, lasting 3 seconds with max of 10% duty cycle.
2. Combined output power of V1 plus fan supply and standby supply should not exceed max power rating.
3. +/-20% tolerance of V<sub>fan</sub> includes the factors of set point accuracy, line and load regulation.
4. Air flow over long edge (either direction) required for air flow rating. See mechanical drawing, Figure 7 on page 11.
5. More than 800K hours MTBF is to be calculated according to Bellcore TR-332 standard current edition at 25 °C.

## 2. OVERVIEW

The ABC600 SERIES AC-DC/DC-DC power supply can operate using AC or DC input. It is a highly efficient front-end power supply. The PFC stage adopts an analog controller in continuous conduction mode to achieve high power factor and high efficiency. The DC/DC stage is fully DSP controlled and employs soft switching resonant techniques in conjunction with synchronous rectification for high efficiency and better thermal control. With a wide input operational voltage range and minimal linear derating of output power with temperature, the ABC600 SERIES maximizes power availability in demanding server, network, and other high availability applications. The supply is convection cooled or fan cooled and ideally suited for integration with a matching airflow path. An active OR-ing MOSFET on the output ensures no reverse current and renders the supply ideally suited for operation in redundant power systems. The always-on standby output V<sub>sb</sub> (5 Volts) provides power to external power distribution and management controllers. It is protected with an active OR-ing diode for maximum reliability. In addition, the Power Management Bus allows full monitoring of the supply, including input and output voltage, current, power, and internal temperatures. Current share signal (V1\_I<sub>share</sub>) is used for current sharing, and the difference between two units is within 2.5 A if system load is more than 25% of full load. The current share signal (V1\_I<sub>share</sub>) voltage shall be a linear function  $V_{CS} = 8 \times I_{out}/I_{max}$  for a single power supply. Example: for ABC600-1012G, VCS is 8 V at 50 A loading;

I<sub>max</sub> is 50 A of ABC600-1012G.

**NOTES:**

1. The output noise and ripple measurement was made with 20 MHz bandwidth using a 6 inch twisted pair, terminated with a 10  $\mu\text{F}$  tantalum capacitor in parallel with a 0.1  $\mu\text{F}$  ceramic capacitor.
2. For ABC600-1048G/52G, the current share abs ( $I_1$ - $I_2$ ) should be less than 3 A at light load (< 25% of full load).

Figure 2. Output Power vs. Temperature

**NOTE:** Power derating linearly to 50% at  $70^\circ\text{C}$  for the output including main output  $V_1$ ,  $V_{fan}$ .

The Output is protected against an overload or a Short Circuit for indefinite duration. The unit shall meet this requirement when in general operating conditions. Over current limit should meet below curve within +/-1.5 A tolerance, and the unit is allowed to hiccup under over current conditions.

Figure 3. Over Current Mode

## 6. GRAPHICAL USER INTERFACE

Bel Power Solutions provides with its “Bel Power Solutions I2C Utility” a Windows® XP/Vista/Win7 compatible graphical user interface allowing the programming and monitoring of the ABC600 Series Front-End. The utility can be downloaded on [www.belpowersolutions.com](http://www.belpowersolutions.com) and supports both the PSMI and Power Management Bus protocols.

The GUI allows automatic discovery of the units connected to the communication bus and will show them in the navigation tree. In the monitoring view the power supply can be controlled and monitored.

- System Management Bus (SMBus) Specification Revision 2.0

Figure 4. I2C Bus to DSP

The sensor commands shall meet the following accuracy requirements:

| COMMAND   | 10%-20% OF MAX LOAD | 20%-100% OF MAX LOAD | Remark                                        |
|-----------|---------------------|----------------------|-----------------------------------------------|
| READ_IIN  | < 0.5 A             | +/-20%               | It is for corresponding to max input current  |
| READ_IOUT | +/-5%               | +/-2.5 A             | It is for corresponding to max output current |
| READ_VIN  | +/-3%               | +/-2.5 V             | It is for corresponding to max input voltage  |
| READ_VOUT | +/-2%               | +/-2%                |                                               |
| READ_PIN  | - - -               | +/-20%               | It is for corresponding to max input power    |
| READ_POUT | +/-5 %              | +/-5%                | It is for corresponding to max output power   |

## 7. TIMING DIAGRAM AND SIGNALS

Unless defined otherwise, all control signals shall be TTL compatible with respect to the output return and shall be isolated from the primary circuit and be SELV rated. All input signals shall be driven from an open collector with the pull-up resistor located in the power supply and shall be capable of sourcing up to 4 mA. Unless otherwise specified, signal levels for parameters listed in the table below are general LVTTTL signals.

| PARAMETER                                              | DESCRIPTION / CONDITION                                                                                                                                                                                                |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A0, A1                                                 | Power Management Bus selected address Pin.                                                                                                                                                                             |
| SDA, SCL                                               | SDA is serial data signal and SCL is serial clock signal (I <sup>2</sup> C).                                                                                                                                           |
| SMB_ALERT_L                                            | Output alert signal. It shall be an open collector with the pull-up resistor located at the receiving end. This signal will be asserted due to fault or warning events. High = Normal, Low = Alert, Refer to Figure 5. |
| V <sub>1_ishare</sub>                                  | Current share signal. The PSU can operate at redundant mode by connecting V <sub>1_ishare</sub> signal of each power supply together.                                                                                  |
| V <sub>1_VS_SENSE</sub> , V <sub>1_VS_SENSE_RTIN</sub> | Remote Sense signal for V1, V <sub>1_VS_SENSE</sub> is positive sense, V <sub>1_VS_SENSE_RTIN</sub> is negative sense.                                                                                                 |
| V <sub>sb</sub> , SGND                                 | V <sub>sb</sub> is standby output, and SGND is secondary ground.                                                                                                                                                       |
| +VP                                                    | Source voltage located at receiving end. Provide a voltage for power good signal. Refer to Figure 6.                                                                                                                   |
| PW_OK_H                                                | Output power good signal. It is isolated from the output. Goes high/low when output is within regulation. Refer to Figure 6 (two methods for Power Good connection).                                                   |
| INHIBIT_L, INHIBIT_L_RTIN                              | Power up signal. It is isolated from the output. Apply a DC voltage between INHIBIT_L and INHIBIT_L_RTIN can power up the unit. Refer to Figure 6.                                                                     |
| V <sub>fan</sub> , SGND                                | V <sub>fan</sub> is fan output to provide energy for user, and SGND is secondary ground.                                                                                                                               |

## 9. SAFETY / AGENCY SPECIFICATIONS

Maximum electric strength testing is performed according to UL/CSA60950-1, EN60950-1, and IEC60950-1. Input-to-output electric strength tests should not be repeated in the field. Bel Power Solutions will not honor any warranty claims resulting from electric strength field tests.
