

SiT9003

Low Power Spread Spectrum Oscillator

Features

- Frequency range from 1 MHz to 110 MHz
- LVCMOS/LVTTL compatible output
- Standby current as low as 0.4 μ A
- Fast resume time of 3 ms (Typ)
- <30 ps cycle-to-cycle jitter
- Spread options (contact SiTime for other spread options)
 - Center spread: \pm 0.50%, \pm 0.25%
 - Down spread: -1%, -0.5%
- Standby, output enable, or spread disable mode
- Industry-standard packages: 2.5 x 2.0, 3.2 x 2.5, 5.0 x 3.2, 7.0 x 5.0 mm x mm
- Outstanding mechanical robustness for portable applications
- All-silicon device with outstanding reliability of 2 FIT (10x improvement over quartz-based devices), enhancing system mean-time-to-failure (MTBF)
- Pb-free, RoHS and REACH compliant

Applications

- Printers
- Flat panel drivers
- PCI
- Microprocessors

Percentage	±0.25%	±0.50% ^[2]	-0.5%	-1.0% ^[2]

Notes:

1. In both center spread and down spread modes, triangle modulation is employed with a frequency of ~32 kHz.
2. ±0.5% and -1.0% are available ONLY for <75 MHz in extended commercial temperature range.

Pin Configuration

Pin	Symbol	Functionality	
1	$\overline{\text{ST/OE/SD}}$	Standby (ST)	H or Open ^[3] : specified frequency output L: output is low (weak pull down). Oscillator stops
		Output Enable (OE)	H or Open ^[3] : specified frequency output L: output is high impedance.
		Spread Disable (SD)	H or Open: Spread = ON L: Spread =OFF
2	GND	Ground	Connect to Ground
3	CLK	Output	Clock Output
4	VDD	Power Supply	

Note:

3. In 1.8 V mode, a resistor of <10 kΩ between OE pin and VDD is recommended.

Absolute Maximum

Attempted operation outside the absolute maximum ratings of the part may cause permanent damage to the part. Actual performance of the IC is only guaranteed within the operational specifications, not at absolute maximum ratings.

Programmable Drive Strength

The SiT9003 includes a programmable drive strength feature to provide a simple, flexible tool to optimize the clock rise/fall time for specific applications. Benefits from the programmable drive strength feature are:

- Improves system radiated electromagnetic interference (EMI) by slowing down the clock rise/fall time
- Improves the downstream clock receiver's (RX) jitter by decreasing (speeding up) the clock rise/fall time.
- Ability to drive large capacitive loads while maintaining full swing with sharp edge rates.

For more detailed information about rise/fall time control and drive strength selection, see the SiTime Applications Note section; <http://www.sitime.com/support/application-notes>.

EMI Reduction by Slowing Rise/Fall Time

Figure 1 shows the harmonic power reduction as the rise/fall times are increased (slowed down). The rise/fall times are expressed as a ratio of the clock period. For the ratio of 0.05, the signal is very close to a square wave. For the ratio of 0.45, the rise/fall times are very close to near-triangular waveform. These results, for example, show that the 11th clock harmonic can be reduced by 35 dB if the rise/fall edge is increased from 5% of the period to 45% of the period.

Figure 1. Harmonic EMI reduction as a Function of Slower Rise/Fall Time

Jitter Reduction with Faster Rise/Fall Time

Power supply noise can be a source of jitter for the downstream chipset. One way to reduce this jitter is to increase rise/fall time (edge rate) of the input clock. Some chipsets would require faster rise/fall time in order to reduce their sensitivity to this type of jitter. The SiT9003 provides up to 3 additional high drive strength settings for very fast rise/fall time. Refer to the [Rise/Fall Time Tables](#) to determine the proper drive strength.

High Output Load Capability

The rise/fall time of the input clock varies as a function of the actual capacitive load the clock drives. At any given drive strength, the rise/fall time becomes slower as the output load

increases. As an example, for a 3.3V SiT9003 device with default drive strength setting, the typical rise/fall time is 1.1ns for 15 pF output load. The typical rise/fall time slows down to 2.9ns when the output load increases to 45 pF. One can choose to speed up the rise/fall time to 1.9ns by then increasing the drive strength setting on the SiT9003.

The SiT9003 can support up to 60 pF or higher in maximum capacitive loads with up to 3 additional drive strength settings. Refer to the [Rise/Tall Time Tables](#) to determine the proper drive strength for the desired combination of output load vs. rise/fall time

SiT9003 Drive Strength Selection

Tables 1 through 4 define the rise/fall time for a given capacitive load and supply voltage.

1. Select the table that matches the SiT9003 nominal supply voltage (1.8V, 2.5V, 2.8V, 3.3V).
2. Select the capacitive load column that matches the application requirement (15 pF to 60 pF)
3. Under the capacitive load column, select the desired rise/fall times.
4. The left-most column represents the part number code for the corresponding drive strength.
5. Add the drive strength code to the part number for ordering purposes.

Calculating Maximum Frequency

Based on the rise and fall time data given in Tables 1 through 4, the maximum frequency the oscillator can operate with guaranteed full swing of the output voltage over temperature as follows:

$$\text{Max Frequency} = \frac{1}{5 \times \text{Trf}_{20/80}}$$

Where $\text{Trf}_{20/80}$ is the typical rise/fall time at 20% to 80% Vdd

Example 1

Calculate f_{MAX} for the following condition:

- Vdd = 3.3V (Table 1)
- Capacitive Load: 30 pF
- Desired Tr/f time = 1.6ns (rise/fall time part number code = Z)

Part number for the above example:

Drive strength code is inserted here. Default setting is “-”
