

Programmable Hex Voltage Supervisor Featuring the LTC2933 with EEPROM

DESCRIPTION

The DC1633B is a demonstration system that showcases the [LTC®2933](#), a 6-channel I²C/SMBus voltage supervisor with EEPROM. The LTC2933 simultaneously monitors up to six power supply voltages and detects under/overvoltage conditions. In addition the LTC2933 monitors two GPIO pins and is able to drive three GPIO pins to indicate OV, UV, system reset, system alert, or other control signal.

The DC1633B is a single circuit board that contains the LTC2933 and support circuitry to provide the ability to demonstrate features and capabilities of the LTC2933 without the need for external power supplies. The DC1633B demo board provides an accurate voltage supervision of six channels and offers over/undervoltage thresholds in various ranges and increments that are digitally programmable.

This demonstration system is supported by the LTpowerPlay™ graphical user interface (GUI) which enables complete control of all the features of the device. Together, the LTpowerPlay software and DC1633B hardware system create a powerful development environment for designing and testing configuration settings of the LTC2933. These settings can be stored in the device's internal EEPROM or in a file. This file can later be used to order pre-programmed devices or to program devices in a production environment. The software displays all of the configuration settings and real time measurements from the system supervisor and peripheral ICs. Telemetry allows easy access and decoding of the fault log created by the LTC2933. The board comes pre-programmed with the EEPROM values appropriate for the six power supply rails on the DC1633B. Just plug and play!

The LTC2933 chip is mounted on the topside of the board with support ADC and DAC circuitry on the back. The ADC provides voltage readings for all six voltage supervisor inputs on the LTC2933 and also reads the GPI and GPIO

voltages. The DAC drives five programmable voltages that are used to emulate the user's system rails. The extra support circuitry allows the user to evaluate the LTC2933 quickly and without the need for external voltmeters or power supplies.

The DC1633B demo board can be powered by an external power supply, such as a +12VDC supply. Communication with the software is provided through the DC1613 USB-to-I²C/SMBus/PMBus controller. The following is a checklist of items which can be obtained from the LTC website or LTC Field Sales.

- USB-to-I²C/SMBus/PMBus Controller (DC1613)
- LTpowerPlay Software

DC1633B Features

- Supervise Six Power Supplies
- Powered from USB Dongle, Power Jack, or V1-V4
- I²C Adjustable OV/UV Trip Points
- Guaranteed Threshold Accuracy ±1%
- I²C/SMBus Serial Interface
- Internal EEPROM
- 256 Programmable Thresholds per Channel
- Up to Three Range Settings per Channel
- Two General Purpose Inputs
- Three General Purpose Inputs/Outputs
- Programmable Output Delays
- Autonomous Operation without Additional Software
- Supported by LTpowerPlay GUI
- LTC2933 Available in 16-Lead DFN and SSOP Packages

Design files for this circuit board are available at
<http://www.linear.com/demo/DC1633B>

GLOSSARY OF TERMS

The following list contains terms used throughout the document.

AUXC: Auxiliary Comparator. A GPI pin may be programmed to this function and map behavior to a GPIO pin. Nominal $V_{TH} = 0.5V$.

EEPROM: Non-volatile memory (NVM) storage used to retain data after power is removed.

Margin: Term used typically in board level testing that increases/decreases the output voltage to look for sensitivity/marginality problems.

MARG: Ignore OV and UV faults when active (low). A GPI pin may be programmed to this function and map behavior to a GPIO pin. Nominal $V_{TH} = 1.0V$.

MR: Manual Reset, Active Low. A GPI pin may be programmed to this function, map behavior to a GPIO pin, and optionally clear the fault history. Nominal $V_{TH} = 1.0V$.

NVM: Non-Volatile Memory, See EEPROM.

OV: Overvoltage. The result of a voltage comparison that a pin voltage is above a programmable threshold voltage.

Rail: The final output voltage that the LTC2933 supervises.

Supervise: The act of quickly responding (compared to a fault setting) to a voltage that is compared to pre-programmed values.

UV: Undervoltage. The result of a voltage comparison that a pin voltage is below a programmable threshold voltage.

UVDIS: UV Disable. Ignore UV faults when the pin is low. A GPI pin may be programmed to this function and map behavior to a GPIO pin. Nominal $V_{TH} = 1.0V$.

THEORY OF OPERATION

GENERAL DESCRIPTION

The LTC2933 is a hex voltage supervisor which detects an over or undervoltage and signals the system of a fault condition. It does not have a dedicated power supply pin. The chip is powered from the highest voltage applied to V1 through V4, as long as one of these voltages is > 3.4V.

THE CHIP

The LTC2933 integrates six voltage supervisors, two GPIs, and three GPIOs. The V1-V6 supervisors are comprised of OV/UV window comparators that can be programmed to map the detection of a fault to one or more GPIO pin.

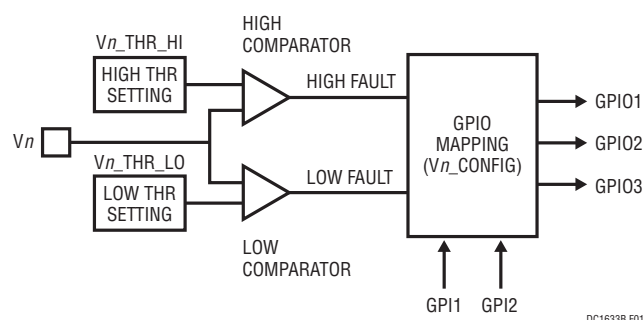

Figure 1. Simplified Block Diagram of Voltage Supervisor Input

In LTpowerPlay, the user programs each voltage supervisor's range, polarity, mapping, and high and low threshold voltages.

Each channel's high/low comparators may be mapped to any GPIO pin, and any comparator may be mapped to multiple GPIO pins. Typically the high comparator is used for the overvoltage condition and the low comparator is used for the undervoltage condition. The high comparator is not dedicated to OV detection nor is the low comparator dedicated for UV detection. For example, both comparators may be configured as OV with the Vn_THR_HI set to indicate an OV Fault and the Vn_THR_LO set for an OV Warning.

The simplified diagram of a GPIO pin shows that the pin may be configured as an active-high or active-low input with optional pullup, or as an active-high or active-low output with optional latched output.

The GPI input pins can be used to override fault conditions by configuring them as MARG or UVDIS. The active-low MARG function allows the LTC2933 to ignore OV and UV conditions. The active-low UVDIS function is a special case of the MARG function. It allows the device to ignore UV conditions. The simplified diagram of a GPI pin shows the four configurable options: Manual Reset, Margin, UV Disable, and AUXC. The AUXC option does not provide an internal pull-up.

THEORY OF OPERATION

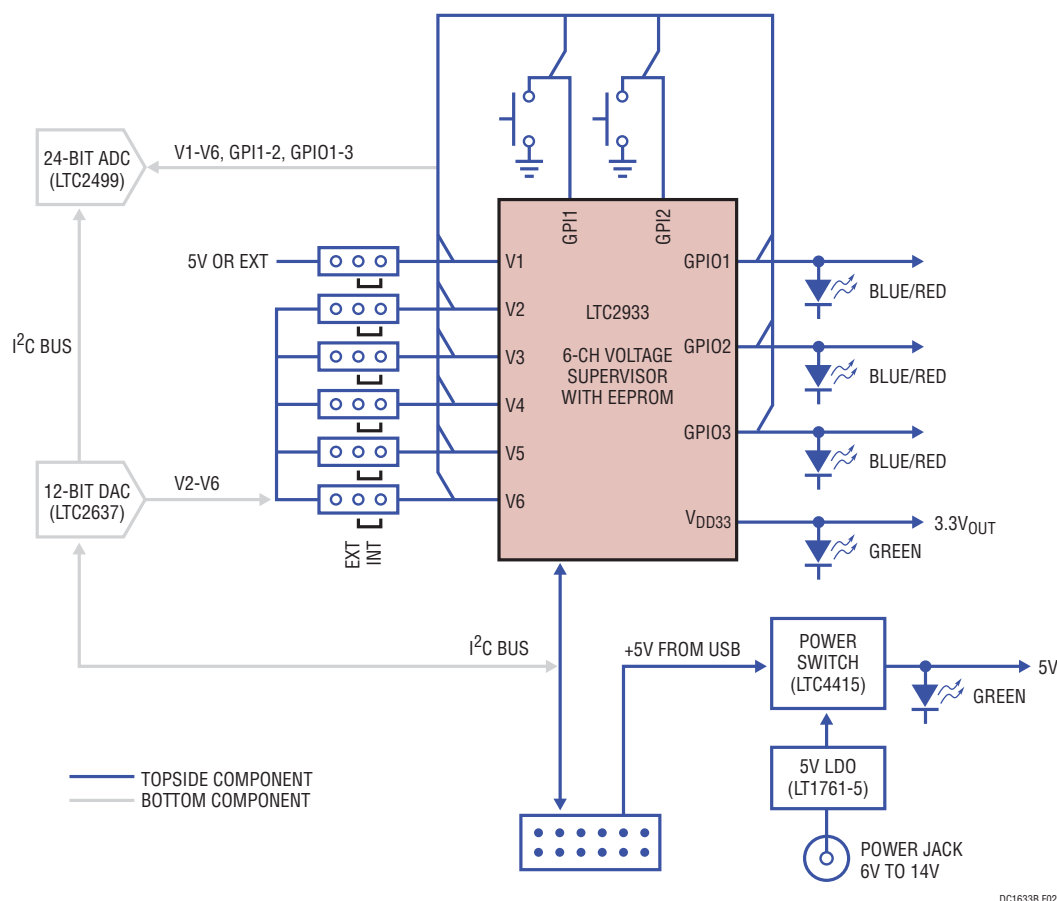

Figure 2. Simplified Block Diagram of the DC1633B

THE BOARD

The LTC2933 chip is mounted on the topside of the board with support ADC and DAC circuitry on the back. The support circuitry is powered from +5V.

The ADC provides voltage readings for all six voltage inputs to the LTC2933 and also reads the GPI and GPIO voltages for a total of eleven. Although the ADC updates at a relatively slow rate, it provides the equivalent of eleven 4½-digit

One LTC2499 (ADC) =

The simplest demonstration of the DC1633B is to power and control the board via the DC1613 USB controller. The controller provides 5V supply and I²C/SMBus read/write control. This setup provides a quick and easy way to demonstrate the LTC2933's capabilities.

One LTC2637 (DAC)

The multi-channel DAC emulates a 5-channel programmable power supply that is used to place “rail” voltages at levels that replicate the user’s system rails. This avoids the need for the user to wire actual supply rails to the demo board. However, the board was designed to allow this use case. The DAC output range is 0V to 4V. This is sufficient for demo purposes. Simply place the V2-V6 jumpers to “INT” for internal DAC use, and set to “EXT” if an external supply is provided on the turret.

THEORY OF OPERATION

POWERING THE BOARD

The DC1633B board can be powered from the DC1613 USB’s 5V power or from a wall-powered 12V supply (jack). The LTC2933 hex supervisor can be powered in a number of different ways. The chip itself is powered by any of the inputs V1 through V4, as long as one is above 3.4V. There is a table silk-screened onto the board as a reminder. An internal diode-OR circuit automatically selects the highest voltage of the four inputs. If the USB power or jack power is present, the +5V LED will illuminate. The LTC2933 can then be powered by setting the jumper to “INT 5V”. Alternatively set the jumper to “V1 EXT” to connect an external power supply voltage to the V1 EXT turret. The board comes pre-configured with jumpers JP1-JP6 set to the INTERNAL position which allows the on-board 5V LDO regulator to power all circuits.

NOTE: *Turrets V2-V6 are tied directly to the LTC2933 independent of the jumper settings. Turret “V1 EXT” is connected to the V1 pin when the jumper is set to V1 EXT and is not connected to the V1 pin when the jumper is set to “INT 5V”. To monitor the V1 pin voltage with a scope probe or DMM, a test point is provided next to the jumper.*

The DC1633B uses a multiplexed ADC that is used to provide voltage readback values. Due to the nature of a multiplexed ADC converter, it has an associated ADC loop time. The total ADC loop time is ~400ms for a given channel. You may notice some lag in the update rate of the displayed voltages.

SELECTING A DEVICE ADDRESS

The DC1633B has a jumper (JP7) labeled ASEL which allows the user to select one of three I²C addresses. See Table 3.

Table 3. Address Selection of LTC2933

I ² C ADDRESS (7-BIT)	POSITION	DEFAULT
0x1C	L	✓
0x1D	Z	
0x1E	H	

Regardless of the jumper setting, the part will always respond to the I²C global 7-bit addresses 0x0C and 0x1B.

STATUS_WORD REGISTER

To clear a fault, the user may click the CF icon in the GUI or simply push the RESET pushbutton on the demo board. In both cases, the red (+) on the CF icon and alert LED on the board will be cleared. You will notice that all rails are automatically re-enabled after a programmable retry period. The alert LED may be cleared by clicking the Clear Faults (CF) icon in the GUI. After clearing faults, the system tree may remain “yellow” if any non-volatile fault logs are present.

RESTORING RAM AND GUI FROM LTC2933

To restore the operating memory (RAM) from the LTC2933 EEPROM contents, click the “R” NVM-to-RAM icon in the toolbar. To read the RAM registers into the GUI, click the “R” RAM-to-PC icon in the toolbar.

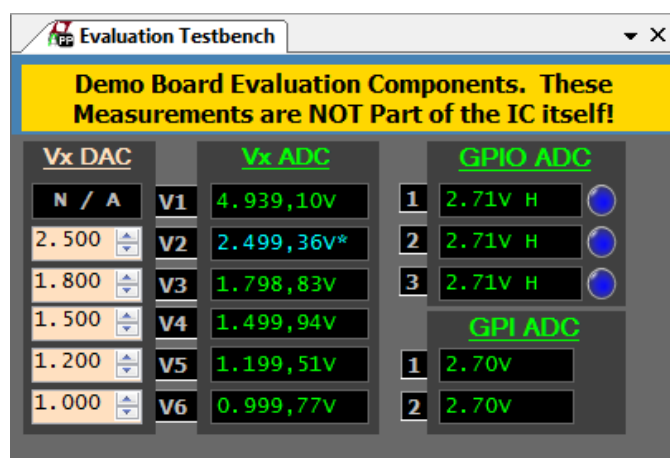

THEORY OF OPERATION

DC1633B LEDS

The DC1633B board has two green LEDs. When USB power (DC1613 Controller) or external power (6V-14V jack) is applied, the +5V green LED will illuminate. The +5V supply provides power to the support circuitry, not necessarily to the LTC2933. The default setting of jumper JP1 is set to internal 5V and the +3.3V OUT LED will illuminate, indicating the LTC2933 is powered. This LED is not a power good indicator and may falsely indicate proper operation when dimly lit. It may be slightly illuminated if the highest voltage on the V1-V4 inputs are set as low as 1.8V. At this point, the LTC2933 is not in a functioning state, the I²C bus will not communicate with the GUI, and the LTC2933 will be grayed out in the system tree.

DC1633B ToolWindow and GUI Indicators

The ToolWindow displays the ADC readings on the left and DAC voltage settings on the right. The blue/red indicators next to the GPIs and GPIOs display the state (H vs L) and voltage reading from the ADC (LTC2499). Blue indicates a logic high and red indicates a logic low. The ToolWindow is automatically populated when LTpowerPlay detects the DC1633B demo board when it starts.

LTpowerPlay GUI SOFTWARE

LTpowerPlay is a powerful Windows-based development environment that supports Linear Technology Power System Management ICs with EEPROM, including the LTC2933 6-channel voltage supervisor. The software supports a variety of different tasks. You can use LTpowerPlay to evaluate Linear Technology ICs by connecting to a demo board system. LTpowerPlay can also be used in an offline mode (with no hardware present) in order to build a multi-chip configuration file that can be saved and reloaded at a later time. LTpowerPlay provides unprecedented system level diagnostic and debug features. It becomes a valuable diagnostic tool during board bring-up to program or tweak the power management scheme

in a system or to diagnose power issues when bringing up rails. LTpowerPlay utilizes the DC1613 I²C/SMBus/PMBus controller to communicate with one of many potential targets, including the DC1633B demo system or a customer board. The software also provides an automatic update feature to keep the software current with the latest set of device drivers and documentation. The LTpowerPlay software can be downloaded from:

<http://www.linear.com/ltpowerplay>

To access technical support documents for LTC Power System Management Products visit "Help, View Online Help" on the LTpowerPlay menu.

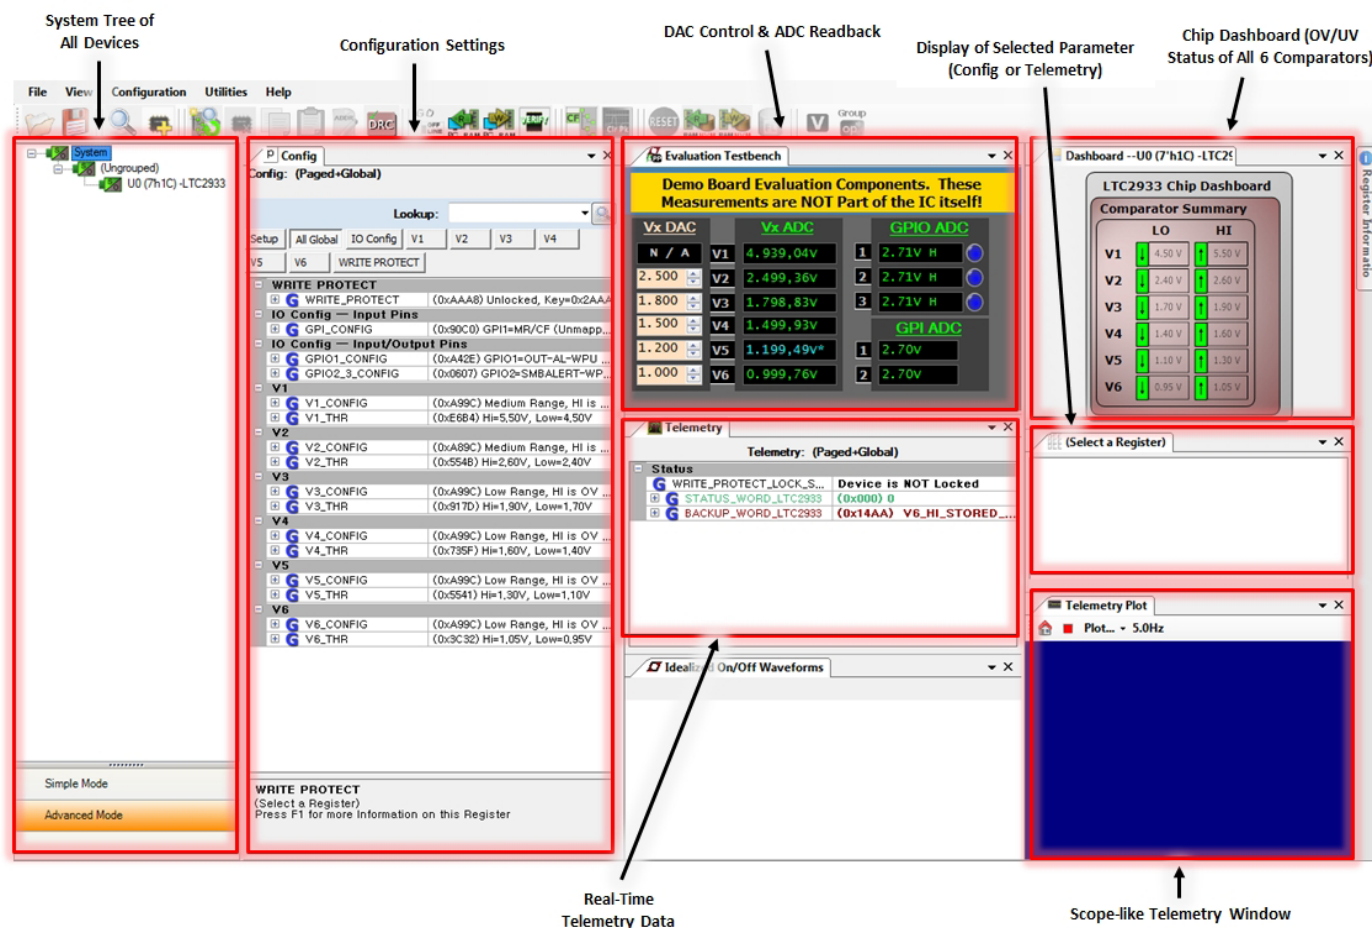

Figure 3. Screenshot of the LTpowerPlay GUI

QUICK START PROCEDURE

The following procedure describes how to set up a DC1633B demo system.

1. Download and install the LTpowerPlay GUI:

www.linear.com/ltpowerplay

2. Remove the board from the ESD protective bag and place it on a level surface. Connect the DC1613 I²C/SMBus/PMBus Controller to the DC1633B board using the 12-pin ribbon cable.

Figure 4. Connecting DC1633B Board and the DC1613 USB to I²C/SMBus/PMBus Controller

3. Plug the USB-to-I²C/SMBus/PMBus Controller into a USB port on your PC. The board should power up with +5V and +3.3V OUT LEDs illuminated green. The GPIO LEDs will illuminate blue.
4. Launch the LTpowerPlay GUI.
 - a. The GUI automatically identifies the DC1633B and builds a system tree for each I²C device. The system tree on the left hand side will look like this:

- b. A green message box will be displayed momentarily in the lower left hand corner confirming that the DC1633B is communicating.

5. Load the Demo Configuration.

In the upper left hand corner of the GUI, select File > Initialize DC1633B Demo > Demo Config (or Factory Defaults). This will load the configuration settings into the working RAM of the LTC2933, set the DAC outputs, clear the status registers, and store the settings into NVM (EEPROM). The 'Demo Config' file is the starting point for the use cases. The 'Factory Defaults' file sets the Vn thresholds that accommodate the initial powerup state of the DAC outputs (2.048V).

SAVING A CONFIGURATION

You can make changes to the LTC2933 register values and DAC settings. Save the demo board configuration to a (*.proj) file by clicking the "Save" icon. This creates a backup file. Name it whatever you like. Note that the DAC settings are saved in the project file.

QUICK START VIDEO

There is a Quick Start video that covers the basic features of the LTC2933 chip and DC1633B demo board. The video can be accessed via LTpowerPlay by navigating to the Help menu > DC1633B.

DC1633B DETAILS – TOP SIDE

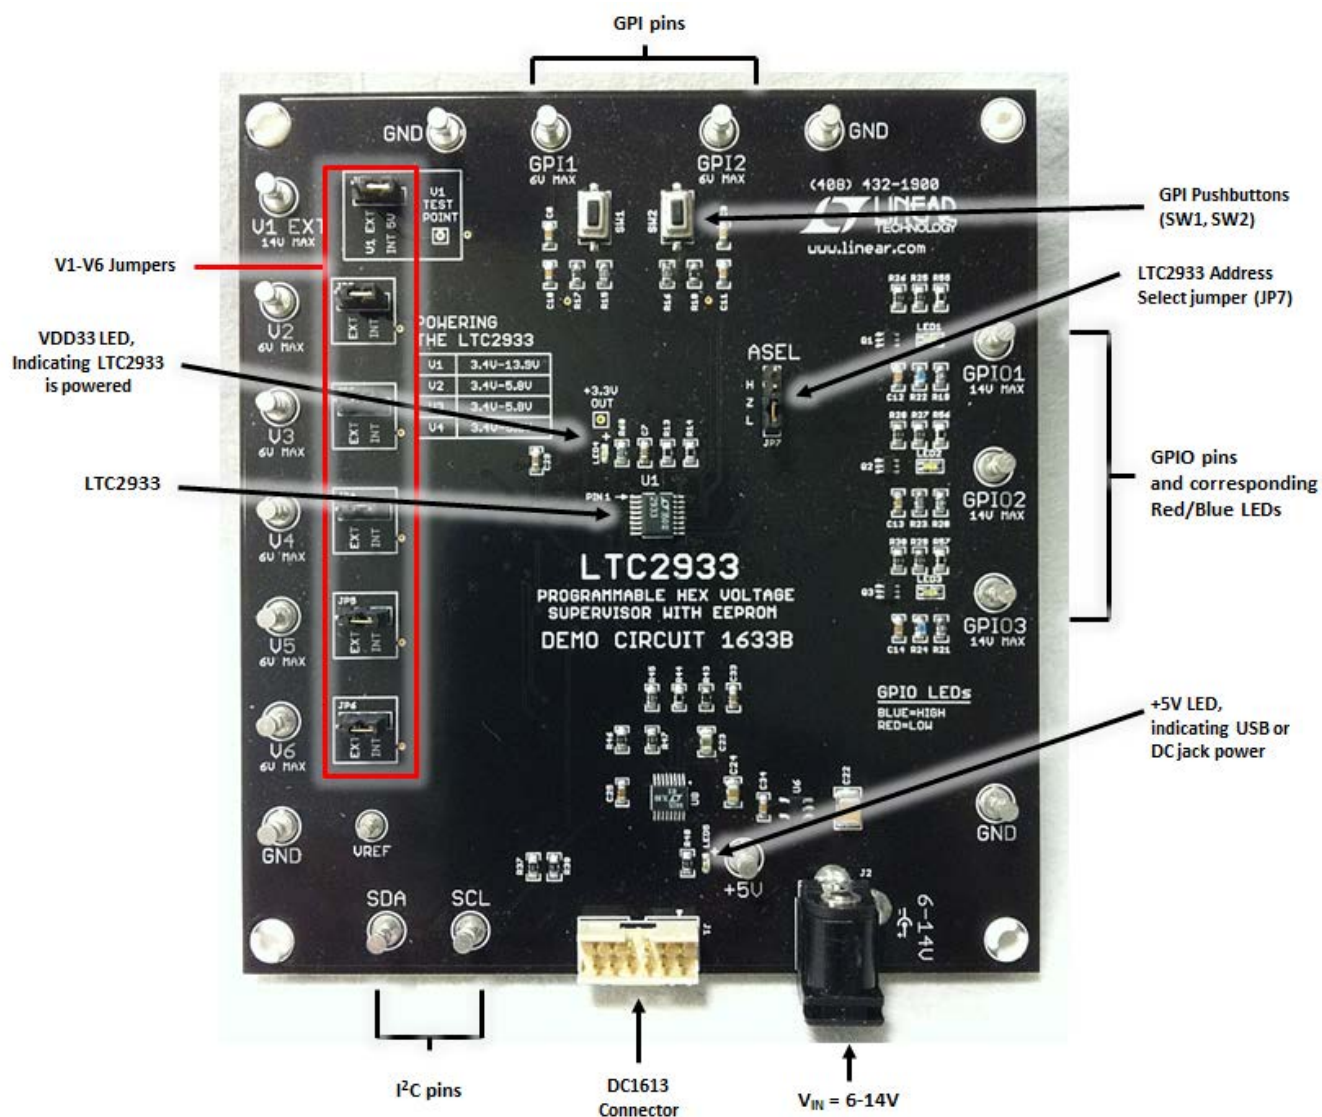

Figure 5. DC1633B Top Side Details

Table 2. Default Jumper Configuration

REFERENCE DESIGNATOR	SIGNAL NAME	USAGE	DEFAULT
JP1	V1	Selects Internal 5V vs External "V1 EXT" Turret Power	INT 5V
JP2-JP6	V2-V6	Selects Internal vs External Voltage	INT
JP7	ASEL	Selects H/Z/L for LTC2933 Slave Address	L

DEMO BOARD USE CASES

USE CASE #1

A common configuration for the LTC2933 dedicates the V1 pin to the highest supply in the system and uses V2-V6 to monitor other voltages. The V1 pin provides power to the chip and also is used to detect an OV or UV on the V1 pin. For simplicity, the USB controller (DC1613) powers the board and the LTC2933 is powered via the V1 pin with the jumper set to INT 5V.

Each of the high comparator fault outputs is mapped to GPIO1, indicating an active-low OV fault. Each of the low comparator fault outputs are mapped to GPIO3, indicating an active-low UV fault. These OV and UV conditions are indicated in multiple places – LEDs next to the GPIO turntables and also in the GUI. The GPIO2 pin has been mapped as an active-low latched OV indicator. The latched ALERT is cleared by pressing the GPI1 pushbutton. The GPIO pins have a red-blue LED which is red when low and blue when high.

The two GPI inputs are used to detect a Manual Reset (MR) and Margin disable (MARG) and activated when the pushbutton switches are depressed.

GPIO1 → $\overline{\text{OV}}$ fault

GPIO2 → $\overline{\text{ALERT}}$ (latched)

GPIO3 → $\overline{\text{UV}}$ fault

GPI1 → $\overline{\text{MR}}$ (manual reset)

GPI2 → $\overline{\text{MARG}}$ (ignore OV/UV when margining)

Let's margin V5 and V6 low by typing a value of 1V and 0.9V into the respective DAC control boxes. You may also move

Vx DAC		Vx ADC
N / A	V1	4.938,19V
2.500	V2	2.499,37V*
1.800	V3	1.798,83V
1.500	V4	1.499,93V
1.000	V5	0.999,82V
0.900	V6	0.899,40V

the DAC output by clicking the up/down arrows on the individual DAC box or by double-clicking the DAC value and entering a new value in the box. V5 and V6 will report a $\overline{\text{UV}}$, turning the LED on

and 1.1V. Also notice in the Telemetry window a STATUS_WORD register, expand it. This register is a live indicator of LO or HI fault conditions. Note the state of LO_FAULT bits when the margin low button is selected. We can demonstrate the effect of the GPI2 pushbutton at this point. The GPI2 pin has been programmed to function as $\overline{\text{MARG}}$, enabling the LTC2933 to ignore all UV conditions. Notice that when the pushbutton is depressed, GPIO3 returns high (blue). This is useful when the system does not want to be informed of a UV condition during margin low testing. Moving the DAC voltages back to 1.2V and 1V returns GPIO3 to a high state (blue), indicating there is no $\overline{\text{UV}}$ condition.

LTC2933 Chip Dashboard		
Comparator Summary		
	LO	HI
V1	4.50 V	5.50 V
V2	2.40 V	2.60 V
V3	1.70 V	1.90 V
V4	1.40 V	1.60 V
V5	1.10 V	1.30 V
V6	0.95 V	1.05 V

BACKUP_WORD_LTC2933	(0x002) V1_LO_STORED_FAULT

Let's margin V5 and V6 high by typing a value of 1.4V and 1.1V into the respective DAC control boxes. V5 and V6 will report an $\overline{\text{OV}}$ in the GUI and on the demo board. Both GPIO1 and GPIO2 LEDs will turn red and the dashboard indicates an OV condition and a latched $\overline{\text{ALERT}}$. Note the state of HI_FAULT bits in the STATUS_WORD register. When the GPI2 button is pushed, the GPIO1 (OV) LED is returned to blue and the STATUS_WORD reflects

LTC2933 Chip Dashboard		
Comparator Summary		
	LO	HI
V1	4.50 V	5.50 V

V3	1.70 V	1.90 V
V4	1.40 V	1.60 V
V5	1.10 V	1.30 V
V6	0.95 V	1.05 V

DEMO BOARD USE CASES

the $\overline{\text{MARG}}$ pin as well, clearing the HI_FAULT bits. We can now change the DACs back to 1.2V and 1.0V. The 0V condition is no longer present, however $\overline{\text{ALERT}}$ (GPIO2) remains latched low. Since the GPI1 pin is defined as a Manual Reset, pressing this button clears the latched ALERT, turning GPIO2 LED blue which indicates a deasserted high state.

USE CASE #2

The DC1633B demo board can be configured to supervise external supply voltages. Inputs V2-V6 may be used for this purpose. Simply move the jumper from INT to EXT which disconnects the backside DAC, allowing an external voltage to be applied to the LTC2933. Please ensure the max ratings on the turrets are not exceeded, most of which are 6V. For simplicity, the V1 jumper will remain in the INT 5V position to power the LTC2933. However, in an actual application, the device is powered from the highest voltage on the V1-V4 pins, assuming at least one is above 3.4V.

Apply an external supply voltage to the turret. It is recommended to drive V1-V4 turrets with a low impedance ($<10\Omega$) voltage source. A sensor or other moderate source impedance voltage may be supervised on V5 or V6 inputs. A battery voltage may be supervised on V1-V4 and power the chip since the LTC2933 supply current is $<700\mu\text{A}$.

For example, a +5V external supply may be connected to turret V2. Notice the GPIO1 and GPIO2 LEDs turn red, indicating $\overline{\text{OV}}$ and $\overline{\text{ALERT}}$ are asserted low. The V2 thresholds need to be changed. Enter 5.5V and 4.5V for the HI and LO threshold settings. The GPIO1 will return high and the LED will change to blue but the GPIO2 remains low (red) since it indicates a latched ALERT. Press the MR pushbutton on GPI1 to release GPIO2 back high (LED blue).

V2_THR	(0xE6B4) Hi=5,50V, Low=4,50V
High Comparator	
Vn_THR_HI	5,5
Low Comparator	
Vn_THR_LO	4,5
Threshold Resolution	
Threshold LSB size	20mV/LSB (depends on Rang...

The GPI inputs may also be used to monitor external voltages. These pins can be configured as an auxiliary comparator (AUXC). In this mode, the GPI pin voltage is compared to an internal 0.5V reference. Typically an external voltage divider is provided to obtain the appropriate trip point for the external voltage. The GPI comparators can be mapped to one of the GPIOs to alert the system of an over or undervoltage condition.

DEMO BOARD USE CASES

USE CASE #3

Another common configuration is one that uses a GPIO pin to drive a system reset. The LTC2933 data sheet shows this feature throughout. The other two GPIOs are configured as previously shown, \overline{OV} and \overline{ALERT} . Additionally a manual reset pushbutton (GPI1) asserts the system reset.

GPI01 \rightarrow \overline{RST} (system reset)

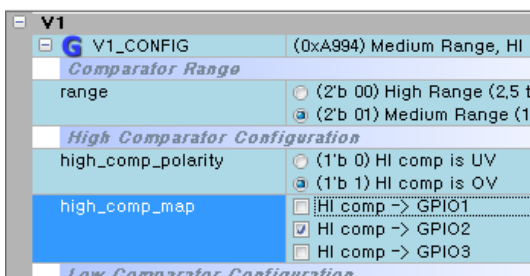

GPI02 \rightarrow \overline{OV}

GPI03 \rightarrow \overline{ALERT}

GPI1 \rightarrow \overline{MR} pushbutton

1. To program GPI01 to system reset function, first uncheck the mapping of all V1-V6 channels to GPI01.

2. Configure GPI1 as a Manual Reset. Map GPI1 to GPI01.

3. Configure GPIO1 as active-low with weak pull-up. To update the changes made in steps 1-3, click the Write All Registers (PC->RAM) icon.

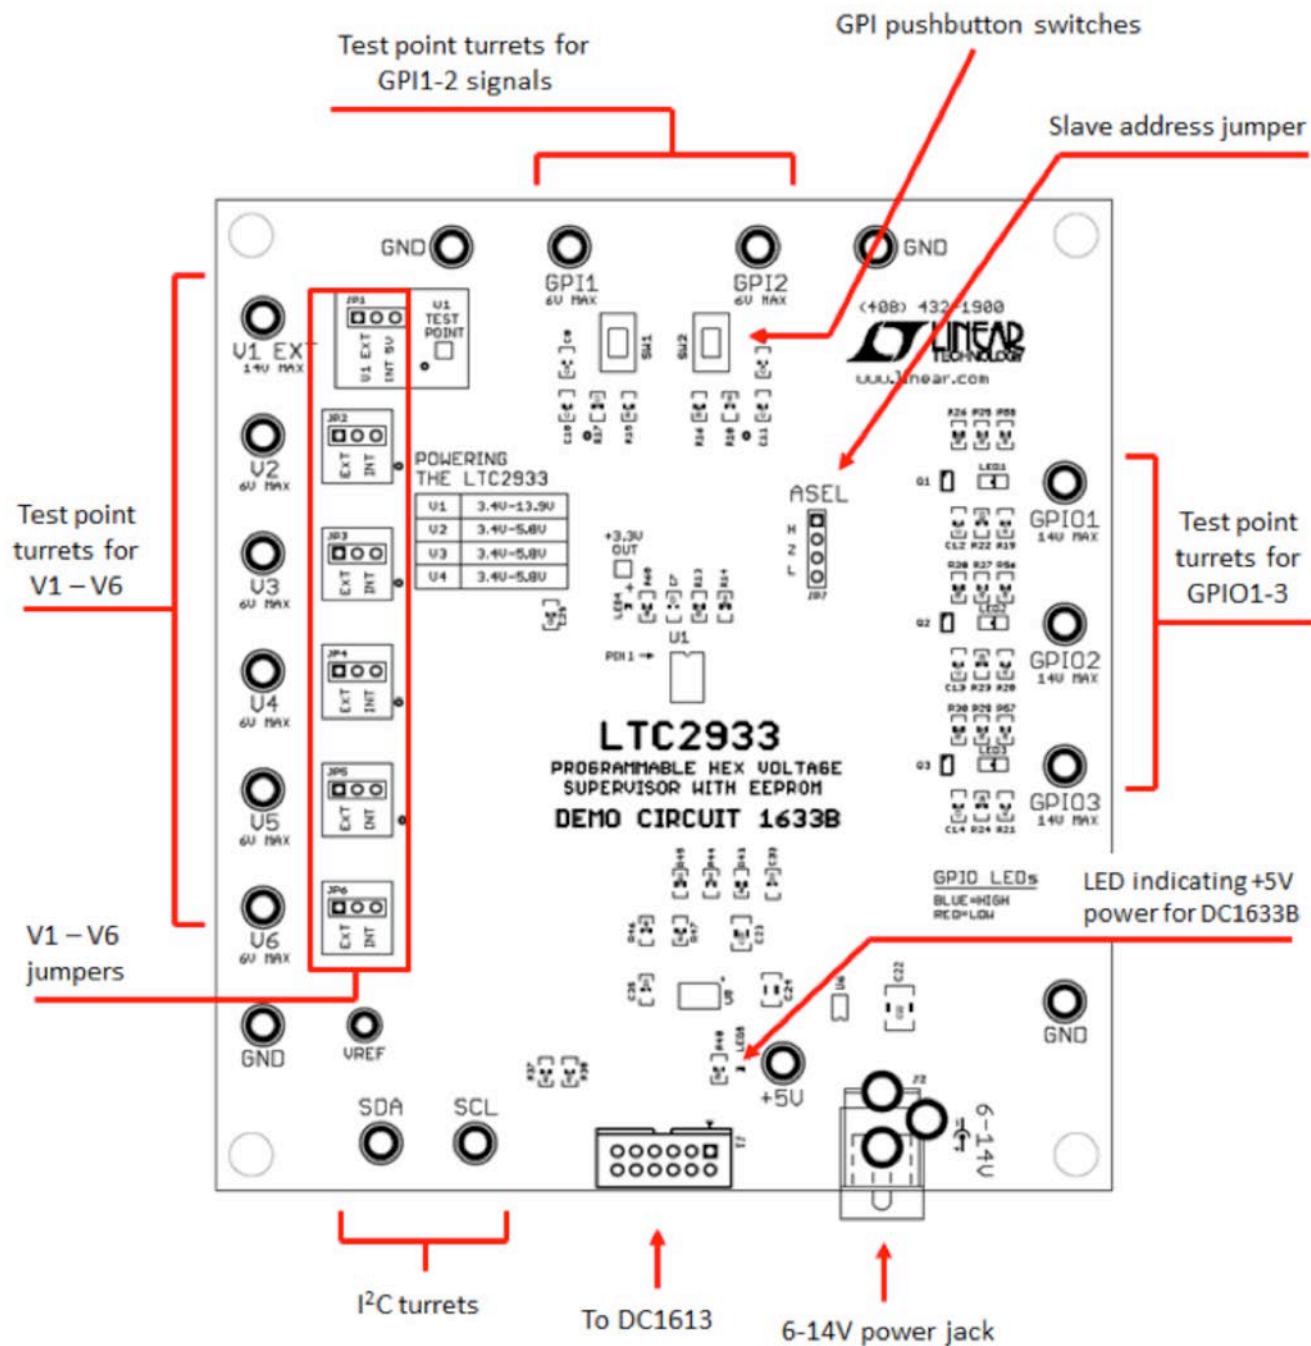

4. You can optionally extend the low time of the system reset by changing the *delay-on-release* setting to ensure a clean release of reset. This provides a time-based debounce of the switch.

When configured in this way, GPIO1 provides a system reset for the host processor and GPI1 can drive a system reset (GPIO1) with a push of a button. You may set the GPIO1 delay-on-release time to 410ms to experience the extended reset firsthand. The UV condition indicator remains on GPIO3. The OV condition is indicated as a latched ALERT on GPIO2. When the GPI1 pushbutton is pressed, a system reset is asserted on GPIO1 and the ALERT is released if the OV condition is removed.

DEMO MANUAL DC1633B

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
