

LP875701-Q1 Four-Phase 3-MHz 1-V 10-A DC/DC Buck Converter With Integrated Switches

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 1: -40°C to $+125^{\circ}\text{C}$ Ambient Operating Temperature
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C4B
- Input Voltage: 2.8 V to 5.5 V
- Output Voltage: 1.0 V
- Four High-Efficiency Step-Down DC/DC Converter Cores:
 - Maximum Output Current: 10 A (2.5 A per Phase)
- Switching Frequency: 3-MHz
- Spread-Spectrum Mode and Phase Interleaving
- Configurable General Purpose I/O (GPIOs)
- I²C-Compatible Interface That Supports Standard (100 kHz), Fast (400 kHz), Fast+ (1 MHz), and High-Speed (3.4 MHz) Modes
- Interrupt Function With Programmable Masking
- Programmable Power-Good Signal (PGOOD)
- Output Short-Circuit and Overload Protection
- Overtemperature Warning and Protection
- Overvoltage Protection (OVP) and Undervoltage Lockout (UVLO)

2 Applications

Automotive Infotainment, Cluster, Radar, and Camera Power Applications

Simplified Schematic

3 Description

The LP875701-Q1 device is designed to meet the power-management requirements of the latest processors and platforms in various automotive power applications. The device contains four step-down DC/DC converter cores, which are configured as a 4-phase output in forced-PWM mode. The device is controlled by an I²C-compatible serial interface and by enable signals.

The LP875701-Q1 supports remote differential-voltage sensing for multiphase outputs to compensate IR drop between the regulator output and the point-of-load (POL) which improves the accuracy of the output voltage. The switching clock can be forced to PWM mode and also synchronized to an external clock to minimize the disturbances.

The LP875701-Q1 device supports load-current measurement without the addition of external current-sense resistors. The LP875701-Q1 device also supports programmable start-up and shutdown delays and sequences synchronized to enable signals. The sequences can also include GPIO signals to control external regulators, load switches, and processor reset. During start-up, the device controls the output slew rate to minimize output-voltage overshoot and in-rush current.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP875701-Q1	VQFN-HR (26)	4.50 mm x 4.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	FB_B2	A	Output voltage feedback (positive) for the BUCK2 converter.
2	EN3	D/I/O	Programmable enable signal for the buck regulators (can be also configured to select between two buck output-voltage levels). This pin functions alternatively as GPIO3.
3	CLKIN	D/I	External clock input. Connect this pin to ground if the external clock is not used.
4, 17, Thermal Pad	AGND	G	Ground
5	SCL	D/I	Serial interface clock input for I ² C access. Connect this pin to a pullup resistor.
6	SDA	D/I/O	Serial interface data input and output for I ² C access. Connect this pin to a pullup resistor.
7	EN1	D/I/O	Programmable enable signal for the buck regulators (can be also configured to select between two buck output voltage levels). This pin functions alternatively as GPIO1.
8	FB_B0	A	Output voltage feedback (positive) for the BUCK0 converter.
9	VIN_B0	P	Input for the BUCK0 converter. The separate power pins, VIN_Bx, are not connected together internally. The VIN_Bx pins must be connected together in the application and be locally bypassed.
10	SW_B0	A	BUCK0 switch node
11	PGND_B01	G	Power ground for the BUCK0 and BUCK1 converters
12	SW_B1	A	BUCK1 switch node
13	VIN_B1	P	Input for the BUCK1 converter. The separate power pins, VIN_Bx, are not connected together internally. The VIN_Bx pins must be connected together in the application and be locally bypassed.
14	FB_B1	A	Output voltage feedback (positive) for the BUCK1 converter. This pin functions alternatively as the output ground feedback (negative) for the BUCK0 converter.
15	EN2	D/I/O	Programmable enable signal for the buck regulators (can be also configured to select between two buck output voltage levels). This pin functions alternatively as GPIO2.
16	PGOOD	D/O	Power-good indication signal
18	VANA	P	Supply voltage for the analog and digital blocks. This pin must be connected to the same node as VIN_Bx.
19	nINT	D/O	Open-drain interrupt output. This pin is active low.
20	NRST	D/I	Reset signal for the device
21	FB_B3	A	Output voltage feedback (positive) for the BUCK3 converter. This pin functions alternatively as the output ground feedback (negative) for the BUCK2 converter.
22	VIN_B3	P	Input for the BUCK3 converter. The separate power pins, VIN_Bx, are not connected together internally. The VIN_Bx pins must be connected together in the application and be locally bypassed.
23	SW_B3	A	BUCK3 switch node
24	PGND_B23	G	Power ground for the BUCK2 and BUCK3 converters
25	SW_B2	A	BUCK2 switch node
26	VIN_B2	P	Input for the BUCK2 converter. The separate power pins, VIN_Bx, are not connected together internally. The VIN_Bx pins must be connected together in the application and be locally bypassed.

(1) A: Analog Pin, D: Digital Pin, G: Ground Pin, P: Power Pin, I: Input Pin, O: Output Pin

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Voltage on power connections	VIN_Bx, VANA	-0.3	6	V
Voltage on buck switch nodes	SW_Bx	-0.3	(VIN_Bx + 0.3 V) with 6 V maximum	V
Voltage on buck voltage sense nodes	FB_Bx	-0.3	(VANA + 0.3 V) with 6 V maximum	V
Voltage on NRST input	NRST	-0.3	6	V
Voltage on logic pins (input or output pins)	SDA, SCL, nINT, CLKIN	-0.3	6	V
	EN1 (GPIO1), EN2 (GPIO2), EN3 (GPIO3), PGOOD	-0.3	(VANA + 0.3 V) with 6 V maximum	V
Maximum lead temperature (soldering, 10 sec.)			260	°C
Junction temperature, T _{J-MAX}		-40	150	°C
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground.

6.2 ESD Ratings

			VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	V	
		Charged-device model (CDM), per AEC Q100-011	All pins		±500
			Corner pins (1, 8, 14, and 21)		±750

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
INPUT VOLTAGE				
Voltage on power connections	VIN_Bx, VANA	2.8	5.5	V
Voltage on NRST	NRST	1.65	VANA with 5.5 V maximum	V
Voltage on logic pins (input or output pins)	nINT, CLKIN	1.65	5.5	V
Voltage on logic pins (input or output pins)	ENx, PGOOD	0	VANA with 5.5 V maximum	V
Voltage on I ² C interface, standard (100 kHz), fast (400 kHz), fast+ (1 MHz), and high-speed (3.4 MHz) modes	SCL, SDA	1.65	1.95	V
Voltage on I ² C interface, standard (100 kHz), fast (400 kHz), and fast+ (1 MHz) modes	SCL, SDA	3.1	VANA with 3.6 V maximum	V
TEMPERATURE				
Junction temperature, T _J		-40	140	°C
Ambient temperature, T _A		-40	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LP875701-Q1	UNIT
		RNF (VQFN-HR)	
		26 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	34.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	16.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	4.7	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.6	°C/W
ψ _{JB}	Junction-to-board characterization parameter	4.7	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	1.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

6.5 Electrical Characteristics

–40°C ≤ T_J ≤ +140°C, C_{POL} = 122 μF/phase, specified V_{VANA}, V_{VIN_Bx}, V_{NRST}, V_{VOUT_Bx}, and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = 3.7 V, and V_{VOUT} = 1.0 V, unless otherwise noted.⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
EXTERNAL COMPONENTS						
C _{IN}	Input filtering capacitance	Connected from VIN_Bx to PGND_Bx		1.9	10	μF
C _{OUT}	Output filtering capacitance per phase, local	10	22		μF	
C _{POL}	Point-of-load (POL) capacitance per phase		122		μF	
C _{OUT-TOTAL}	Total output capacitance ⁽²⁾ (local and POL)	4-phase output		400	1500	μF
ESR _C	ESR of the input and output capacitor	1 MHz ≤ f ≤ 10 MHz		2	10	mΩ
L	Inductor value and tolerance of the inductor		0.33		μH	
		–30%		30%		
DCR _L	Inductor DCR		20		mΩ	
BUCK REGULATOR						
V _{VIN_Bx}	Input voltage range	2.8		5.5	V	
I _{OUT}	Output current ⁽³⁾ The maximum output current from device is 10A regardless of device phase configurations.	4-phase output, V _{VIN} ≥ 3 V		10	A	
		4-phase output, 2.8 V ≤ V _{VIN} < 3 V		7.2		
	Input and output voltage difference Minimum voltage between VIN_x and V _{VOUT} to fulfill the electrical characteristics	0.5			V	
V _{VOUT_DC}	DC output voltage and accuracy, includes voltage reference, DC load and line regulations, process, and temperature	V _{VIN} = 3.3 V +/- 5% , 5 V +/- 5%, forced PWM mode, forced 4-phase operation, f _{SW} = 3 MHz +/- 10% (either through internal or external clock), in case external clock is used: spread-spectrum disabled	0.985	1	1.015	V
	Ripple voltage	4-phase output, forced PWM mode, ESR _C < 2 mΩ, L = 0.33 μH		3	mV _{p-p}	
DC _{LNR}	DC line regulation	I _{OUT} = I _{OUT(max)}		0.1	%/V	

- (1) All voltage values are with respect to network ground.
- (2) The output voltage slew-rate setting limits the maximum output capacitance.
- (3) The maximum output current can be limited by the forward current limit I_{LIM_FWD} and by the junction temperature. The power dissipation inside the die depends on the length of the current pulse and efficiency and the junction temperature may increase to thermal shutdown level if the board and ambient temperatures are high.

Electrical Characteristics (continued)

–40°C ≤ T_J ≤ +140°C, C_{POL} = 122 μF/phase, specified V_{VANA}, V_{VIN_Bx}, V_{NRST}, V_{VOUT_Bx}, and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = 3.7 V, and V_{OUT} = 1.0 V, unless otherwise noted.⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
DC _{LDR}	DC load regulation in PWM mode	0 A ≤ I _{OUT} ≤ I _{OUT(max)}	0.01		%/A	
TR _{LDSR}	Transient load step response in PWM mode	V _{IN} = 5 V +/- 5%, f _{SW} = 3 MHz +/- 10% (either through internal or external clock), in case external clock is used: spread-spectrum disabled, forced 4-phase operation, forced PWM mode 1.5 A ≤ I _{OUT} ≤ 7.5 A, t _r = t _f = 1 μs, C _{OUT} = 22 μF/phase, L = 0.33 μH, C _{POL} = 122 μF/phase	±12		mV	
		V _{IN} = 3.3 V +/- 5%, f _{SW} = 3 MHz +/- 10% (either through internal or external clock), in case external clock is used: spread-spectrum disabled, forced 4-phase operation, forced PWM mode 1.5 A ≤ I _{OUT} ≤ 7.5 A, t _r = t _f = 1 μs, C _{OUT} = 22 μF/phase, L = 0.33 μH, C _{POL} = 122 μF/phase	±15			
TR _{LNSR}	Transient line response	V _{VIN_Bx} stepping 3.15 V ↔ 3.4 V, t _r = t _f = 10 μs, I _{OUT} = I _{OUT(max)}	±2		mV	
I _{LIM FWD}	Forward current limit for each phase (peak for each switching cycle)	V _{VIN_Bx} ≥ 3 V Forward current limit for each phase set to 3.5A (ILIMx[2:0]=4h)	3.3	3.8	4.2	A
		2.8 V ≤ V _{VIN_Bx} < 3 V Forward current limit for each phase set to 3.5A (ILIMx[2:0]=4h)	2.8	3.8	4.2	
I _{LIM NEG}	Negative current limit per phase (peak for each switching cycle)		1.6	2	2.4	A
R _{DS(ON) HS FET}	On-resistance, high-side FET	Each phase, between VIN_Bx and SW_Bx pins, I = 1 A		29	65	mΩ
R _{DS(ON) LS FET}	On-resistance, low-side FET	Each phase, between SW_Bx and PGND_Bx pins, I = 1 A		17	35	mΩ
f _{SW}	Switching frequency, PWM mode		2.7	3	3.3	MHz
	Current balancing for multiphase outputs	Current mismatch between phases, I _{OUT} > 1 A/phase			10%	
	Start-Up time (soft start)	From ENx to V _{OUT} = 0.35 V (slew-rate control begins), C _{OUT_TOTAL} = 144 μF/phase		200		μs
	Output voltage slew-rate ⁽⁴⁾		3.23	3.8	4.4	mV/μs
	Output pulldown resistance	Regulator disabled	160	230	300	Ω
Output voltage monitoring for PGOOD pin	Overvoltage monitoring (compared to DC output-voltage level, V _{VOUT_DC})		39	50	64	mV
	Undervoltage monitoring (compared to DC output-voltage level, V _{VOUT_DC})		–53	–40	–29	
	Deglitch time during regulator enable PGOOD_SET_DELAY = 0h		4	7	10	μs
	Deglitch time during regulator enable PGOOD_SET_DELAY = 1h		10	11	13	ms
	Deglitch time during operation and after voltage change		4	7	10	μs

(4) Output capacitance, forward and negative current limits and load current may limit the maximum and minimum slew rates.

Electrical Characteristics (continued)

–40°C ≤ T_J ≤ +140°C, C_{POL} = 122 µF/phase, specified V_{VANA}, V_{VIN_Bx}, V_{NRST}, V_{VOUT_Bx}, and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = 3.7 V, and V_{OUT} = 1.0 V, unless otherwise noted.⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power-good threshold for interrupt BUCKx_PG_INT, difference from final voltage	Rising ramp voltage, enable or voltage change	–20	–14	–8	mV
	Falling ramp voltage, voltage change	8	14	20	
Power-good threshold for status bit BUCKx_PG_STAT	During operation, status signal is forced to 0h during voltage change	–20	–14	–8	mV
EXTERNAL CLOCK AND PLL					
Nominal frequency of the external input clock		1		24	MHz
Nominal frequency step size of the external input clock			1		MHz
Required accuracy from nominal frequency of the external input clock		–30%		10%	
Delay time for missing external clock detection				1.8	µs
Delay and debounce time for external clock detection				20	µs
Clock change delay (internal to external) delay from valid clock detection to use of external clock			600		µs
Cycle-to-cycle PLL output clock jitter			300		ps, p-p
PROTECTION FUNCTIONS					
Thermal warning	Temperature rising, TDIE_WARN_LEVEL = 0h	115	125	135	°C
	Temperature rising, TDIE_WARN_LEVEL = 1h	127	137	147	
Thermal warning hysteresis			20		°C
Thermal shutdown	Temperature rising	140	150	160	°C
Thermal shutdown hysteresis			20		°C
VANA _{OVP} VANA overvoltage	Voltage rising	5.6	5.8	6.1	V
	Voltage falling	5.45	5.73	5.96	
VANA overvoltage hysteresis		40			mV
VANA _{UVLO} VANA undervoltage lockout	Voltage rising	2.51	2.63	2.75	V
	Voltage falling	2.5	2.6	2.7	
LOAD CURRENT MEASUREMENT					
Current measurement range	Output current for maximum code			20.47	A
Resolution	LSB		20		mA
Measurement accuracy	I _{OUT} > 1 A		<10%		
Measurement time	PWM mode		4		µs
CURRENT CONSUMPTION					
Shutdown current consumption	From VANA and VIN_Bx pins, NRST = 0 V, VANA = VIN_Bx = 3.7 V		1.4		µA

Electrical Characteristics (continued)

–40°C ≤ T_J ≤ +140°C, C_{POL} = 122 μF/phase, specified V_{VANA}, V_{VIN_Bx}, V_{NRST}, V_{VOUT_Bx}, and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = 3.7 V, and V_{OUT} = 1.0 V, unless otherwise noted.⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
Standby current consumption	From VANA and VIN_Bx pins, NRST = 1.8 V, VANA = VIN_Bx = 3.7 V, regulators disabled		6.7		μA	
Active current consumption during PWM operation	Total current for forced 4-phase operation, V _{IN} = 3.3 V		70		mA	
	Total current for forced 4-phase operation, V _{IN} = 5 V		103			
PLL and clock detector current consumption	Additional current consumption when internal RC oscillator, clock detector and PLL are enabled		2		mA	
DIGITAL INPUT SIGNALS: NRST, EN1, EN2, EN3, EN4, SCL, SDA, GPIO1, GPIO2, GPIO3, CLKIN						
V _{IL}	Input low level			0.4	V	
V _{IH}	Input high level	1.2			V	
V _{HYS}	Hysteresis of Schmitt trigger inputs	10	77	200	mV	
	ENx pulldown resistance	ENx_PD = 1h	500		kΩ	
	NRST pulldown resistance	Always present	650	1150	1700	kΩ
DIGITAL OUTPUT SIGNALS: nINT						
V _{OL}	Output low level	I _{SOURCE} = 2 mA		0.4	V	
R _P	External pullup resistor	To VIO supply	10		kΩ	
DIGITAL OUTPUT SIGNALS: SDA

DIGITAL OUTPUT SIGNALS: PGOOD, GPIO1, GPIO2, GPIO3						
V _{OL}	Output low level	I _{SOURCE} = 2 mA		0.4	V	
V _{OH}	Output high level, configured to push-pull	I _{SINK} = 2 mA	V _{VANA} – 0.4	V _{VANA}	V	
V _{PU}	Supply voltage for external pull-up resistor, configured to open-drain			V _{VANA}	V	
R _{PU}	External pullup resistor, configured to open-drain		10		kΩ	
ALL DIGITAL INPUTS						
I _{LEAK}	Input current	All logic inputs over pin voltage range (except NRST)	–1	1	μA	

6.6 I²C Serial Bus Timing Requirements

These specifications are ensured by design. $V_{IN_BX} = 3.7\text{ V}$, unless otherwise noted.

		MIN	MAX	UNIT	
f_{SCL}	Serial clock frequency	Standard mode	100	kHz	
		Fast mode	400		
		Fast mode+	1	MHz	
		High-speed mode, $C_b = 100\text{ pF}$	3.4		
		High-speed mode, $C_b = 400\text{ pF}$	1.7		
t_{LOW}	SCL low time	Standard mode	4.7	μs	
		Fast mode	1.3		
		Fast mode+	0.5		
		High-speed mode, $C_b = 100\text{ pF}$	160	ns	
		High-speed mode, $C_b = 400\text{ pF}$	320		
t_{HIGH}	SCL high time	Standard mode	4	μs	
		Fast mode	0.6		
		Fast mode+	0.26		
		High-speed mode, $C_b = 100\text{ pF}$	60	ns	
		High-speed mode, $C_b = 400\text{ pF}$	120		
$t_{SU;DAT}$	Data setup time	Standard mode	250	ns	
		Fast mode	100		
		Fast mode+	50		
		High-speed mode	10		
$t_{HD;DAT}$	Data hold time	Standard mode	10	3450	ns
		Fast mode	10	900	
		Fast mode+	10		
		High-speed mode, $C_b = 100\text{ pF}$	10	70	ns
		High-speed mode, $C_b = 400\text{ pF}$	10	150	
$t_{SU;STA}$	Setup time for a start or a repeated start condition	Standard mode	4.7	μs	
		Fast mode	0.6		
		Fast mode+	0.26	ns	
		High-speed mode	160		
$t_{HD;STA}$	Hold time for a start or a repeated start condition	Standard mode	4	μs	
		Fast mode	0.6		
		Fast mode+	0.26	ns	
		High-speed mode	160		
t_{BUF}	Bus free time between a stop and start condition	Standard mode	4.7	μs	
		Fast mode	1.3		
		Fast mode+	0.5		
$t_{SU;STO}$	Setup time for a stop condition	Standard mode	4	μs	
		Fast mode	0.6		
		Fast mode+	0.26		
		High-speed mode	160	ns	
t_{rDA}	Rise time of SDA signal	Standard mode		1000	ns
		Fast mode	20	300	
		Fast mode+		120	
		High-speed mode, $C_b = 100\text{ pF}$	10	80	
		High-speed mode, $C_b = 400\text{ pF}$	20	160	

I²C Serial Bus Timing Requirements (continued)

These specifications are ensured by design. $V_{IN_Bx} = 3.7\text{ V}$, unless otherwise noted.

		MIN	MAX	UNIT
t_{fDA}	Fall time of SDA signal	Standard mode		300
		Fast mode		$20 \times (V_{DD} / 5.5\text{ V})$
		Fast mode+		$20 \times (V_{DD} / 5.5\text{ V})$
		High-speed mode, $C_b = 100\text{ pF}$		10
		High-speed mode, $C_b = 400\text{ pF}$		30
t_{rCL}	Rise time of SCL signal	Standard mode		1000
		Fast mode		20
		Fast mode+		120
		High-speed mode, $C_b = 100\text{ pF}$		10
		High-speed mode, $C_b = 400\text{ pF}$		20
t_{rCL1}	Rise time of SCL signal after a repeated start condition and after an acknowledge bit	High-speed mode, $C_b = 100\text{ pF}$		10
		High-speed mode, $C_b = 400\text{ pF}$		20
t_{fCL}	Fall time of a SCL signal	Standard mode		300
		Fast mode		$20 \times (V_{DD} / 5.5\text{ V})$
		Fast mode+		$20 \times (V_{DD} / 5.5\text{ V})$
		High-speed mode, $C_b = 100\text{ pF}$		10
		High-speed mode, $C_b = 400\text{ pF}$		20
C_b	Capacitive load for each bus line (SCL and SDA)		400	pF
t_{SP}	Pulse width of spike suppressed (SCL and SDA spikes that are less than the indicated width are suppressed)	Standard mode, fast mode and fast mode+		50
		High-speed mode		10

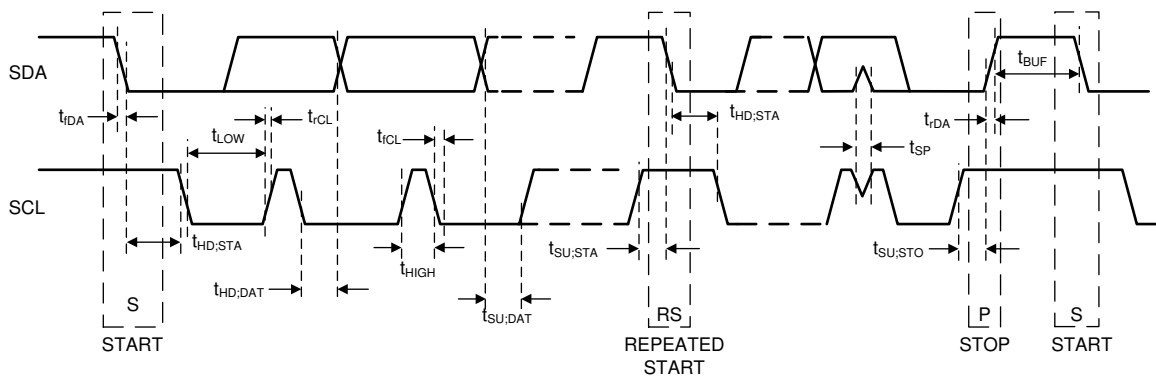

Figure 1. I²C Timing

6.7 Typical Characteristics

Unless otherwise specified: $T_A = 25^\circ\text{C}$, $V_{IN} = 3.7\text{ V}$, $V_{OUT} = 1\text{ V}$, $V_{(NRST)} = 1.8\text{ V}$, $f_{SW} = 3\text{ MHz}$, $L = 0.33\text{ }\mu\text{H}$ (Murata DFE252012PD-R33M), $C_{OUT} = 22\text{ }\mu\text{F / phase}$, $C_{POL} = 122\text{ }\mu\text{F / phase}$.

7 Detailed Description

7.1 Overview

The LP875701-Q1 is a high-efficiency, high-performance power supply device with four step-down DC/DC converter cores for automotive applications. [Table 1](#) lists the output characteristics of the regulators.

Table 1. Regulator Outputs

SUPPLY	OUTPUT		
	V _{OUT} RANGE	RESOLUTION	I _{MAX} MAXIMUM OUTPUT CURRENT
BUCK0, BUCK1, BUCK2, BUCK3 in one 4-phase output	1.0 V	Not Applicable	2.5 A per phase

The LP875701-Q1 also supports switching clock synchronization to an external clock. The nominal frequency of the external clock can be from 1 MHz to 24 MHz with 1-MHz steps.

Additional features include:

- Soft start
- Input voltage protection:
 - Undervoltage lockout
 - Overvoltage protection
- Output voltage monitoring and protection:
 - Overvoltage monitoring
 - Undervoltage monitoring
 - Overload protection
- Thermal warning
- Thermal shutdown

Three enable signals can be multiplexed to general purpose I/O (GPIO) signals. The direction and output type (open-drain or push-pull) are programmable for the GPIOs.

7.2 Functional Block Diagram

7.3 Feature Descriptions

7.3.1 Multi-Phase DC/DC Converters

7.3.1.1 Overview

The LP875701-Q1 includes four step-down DC/DC converter cores which are configured as a 4-phase single output.

The LP875701-Q1 has the following features:

- Optional external clock input to minimize crosstalk
- Optional spread spectrum technique to decrease EMI
- Phase control for optimized EMI
- Synchronous rectification
- Current mode loop with PI compensator
- Soft start
- Power Good flag with maskable interrupt
- Power Good signal (PGOOD) with selectable sources
- Average output current sensing (for load current measurement)
- Current balancing between the phases of the converter
- Differential voltage sensing from point of the load for multiphase output

The following parameters can be programmed via registers:

- Forced multiphase operation for multiphase outputs (forces also the PWM operation)
- Enable and disable delays for regulators and GPIOs controlled by ENx pins

Feature Descriptions (continued)

The 4 buck converters in the LP875701-Q1 operate in forced multiphase configuration as one 4-phase converter, which offers several advantages over one power stage converter. For application processor power delivery, lower ripple on the input and output currents and faster transient response to load steps are the most significant advantages. Also, because the load current is evenly shared among multiple channels in multiphase output configuration, the heat generated is greatly decreased for each channel due to the fact that power loss is proportional to square of current. The physical size of the output inductor shrinks significantly due to this heat reduction. Figure 4 shows a block diagram of a single core.

Interleaving switching action of the 4-phase converter is shown in Figure 5. The 4-phase converter switches each channel 90° apart. As a result, the 4-phase converter has an effective ripple frequency four times greater than the switching frequency of a one phase converter

Feature Descriptions (continued)

(1) Graph is not in scale and is for illustrative purposes only.

Figure 5. Example of PWM Timings, Inductor Current Waveforms, and Total Output Current in 4-Phase Configuration.

7.3.1.2 Multiphase Switcher Configurations

In single 4-phase output configuration the BUCK0 is master for the BUCK0, BUCK1, BUCK2, BUCK3 output.

In the multiphase configuration the control of the multiphase regulator settings is done using the control registers of the master buck. The following slave registers are ignored:

- BUCKx_CTRL1 register, except EN_RDISx bit
- BUCKx_DELAY register
- interrupt bits related to the slave buck, except BUCKx_ILIM_INT

7.3.1.3 Buck Converter Load-Current Measurement

Buck load current can be monitored via I²C registers. The monitored buck converter is selected with the LOAD_CURRENT_BUCK_SELECT[1:0] bits in SEL_I_LOAD register. A write to this selection register starts a current measurement sequence. The measurement sequence is 50 μ s long, maximum. The LP875701-Q1 device can be configured to give out an interrupt (I_LOAD_READY bit in INT_TOP1 register) after the load current measurement sequence is finished. Load current measurement interrupt can be masked with I_LOAD_READY_MASK bit (TOP_MASK1 register). The measurement result can be read from registers I_LOAD_1 and I_LOAD_2. Register I_LOAD_1 bits BUCK_LOAD_CURRENT[7:0] give out the LSB bits and

Feature Descriptions (continued)

register `I_LOAD_2` bits `BUCK_LOAD_CURRENT[9:8]` the MSB bits. The measurement result `BUCK_LOAD_CURRENT[9:0]` LSB is 20 mA, and maximum value of the measurement corresponds to 20.46 A. If the selected buck regulator is a master phase, the measured current is the total value of the master and slave phases. If the selected buck regulator is a slave phase, the measured current is the output current of the selected phase.

7.3.1.4 Spread-Spectrum Mode

Systems with periodic switching signals may generate a large amount of switching noise in a set of narrowband frequencies (the switching frequency and its harmonics). The usual solution to decrease noise coupling is to add EMI filters and shields to the boards. The LP875701-Q1 device has register selectable spread-spectrum mode which minimizes the need for output filters, ferrite beads, or chokes. In spread-spectrum mode, the switching frequency varies around the center frequency, reducing the EMI emissions radiated by the converter and associated passive components and PCB traces (see Figure 6). This feature is available only when internal RC oscillator is used (`PLL_MODE[1:0] = 00` in `PLL_CTRL` register), and it is enabled with the `EN_SPREAD_SPEC` bit (`PIN_FUNCTION` register), and it affects all the buck cores.

Where a fixed-frequency converter exhibits large amounts of spectral energy at the switching frequency, the spread-spectrum architecture of the LP875701-Q1 spreads that energy over a large bandwidth.

Figure 6. Spread-Spectrum Modulation

7.3.2 Sync Clock Functionality

The LP875701-Q1 device contains a `CLKIN` input to synchronize switching clock of the buck regulator with the external clock. The block diagram of the clocking and PLL module is shown in Figure 7. Depending on the `PLL_MODE[1:0]` bits (in `PLL_CTRL` register) and the external clock availability, the external clock is selected and interrupt is generated as shown in Table 2. The interrupt can be masked with `SYNC_CLK_MASK` bit in `TOP_MASK1` register. The nominal frequency of the external input clock is set by `EXT_CLK_FREQ[4:0]` bits (in `PLL_CTRL` register) and it can be from 1 MHz to 24 MHz with 1-MHz steps. The external clock must be inside accuracy limits ($-30\%/+10\%$) for valid clock detection.

The `NO_SYNC_CLK` interrupt (in `INT_TOP1` register) is also generated in cases the external clock is expected but it is not available. These cases are start-up (read `OTP-to-STANDBY` transition) when `PLL_MODE[1:0] = 01` and regulator enable (`STANDBY-to-ACTIVE` transition) when `PLL_MODE[1:0] = 10`.

ACTIVE	1h	Enabled	When external clock appears or disappears	Automatic change to external clock when available
STANDBY	2h	Disabled	No	Internal RC
ACTIVE	2h	Enabled	When external clock appears or disappears	Automatic change to external clock when available
STANDBY	3h		Reserved	
ACTIVE	3h		Reserved	

7.3.3 Power-Up

The power-up sequence for the LP875701-Q1 is as follows:

- VANA (and VIN_Bx) reach minimum recommended level ($V_{VANA} > VANA_{UVLO}$).
- NRST is set to high level (or shorted to VANA). This initiates power-on-reset (POR), OTP reading and enables the system I/O interface. The I²C host must wait at least 1.2 ms before applying signals to ENx pins or writing or reading data to the LP875701-Q1 .
- Device goes to the STANDBY-mode.
- The host can change the default register setting by I²C if needed.
- The regulator(s) can be enabled/disabled by ENx pin(s) and by I²C interface.

7.3.4 Regulator Control

7.3.4.1 Enabling and Disabling Regulators

The regulator(s) can be enabled when the device is in STANDBY or ACTIVE state. There are two ways for enable and disable the regulators:

- Using EN_BUCK0 bit in BUCK0_CTRL1 register (EN_PIN_CTRL0 register bit is 0h)
- Using EN1, EN2, EN3 control pins (EN_BUCK0 bit is 1h AND EN_PIN_CTRL0 register bit is 1 in BUCK0_CTRL1 register)

If the EN1, EN2, EN3 control pins are used for enable and disable then the control pin is selected with BUCK0_EN_PIN_SELECT[1:0] bits (in BUCK0_CTRL1 register). The delay from the control signal rising edge to enabling of the regulator is set by BUCK0_STARTUP_DELAY[3:0] bits and the delay from control signal falling edge to disabling of the regulator is set by BUCK0_SHUTDOWN_DELAY[3:0] bits in BUCK0_DELAY register. The delays are valid only for EN1, EN2, EN3 signal control. The control with EN_BUCK0 bit is immediate without the delays.

The control of the regulator (with 0-ms delays) is shown in [Table 3](#).

NOTE

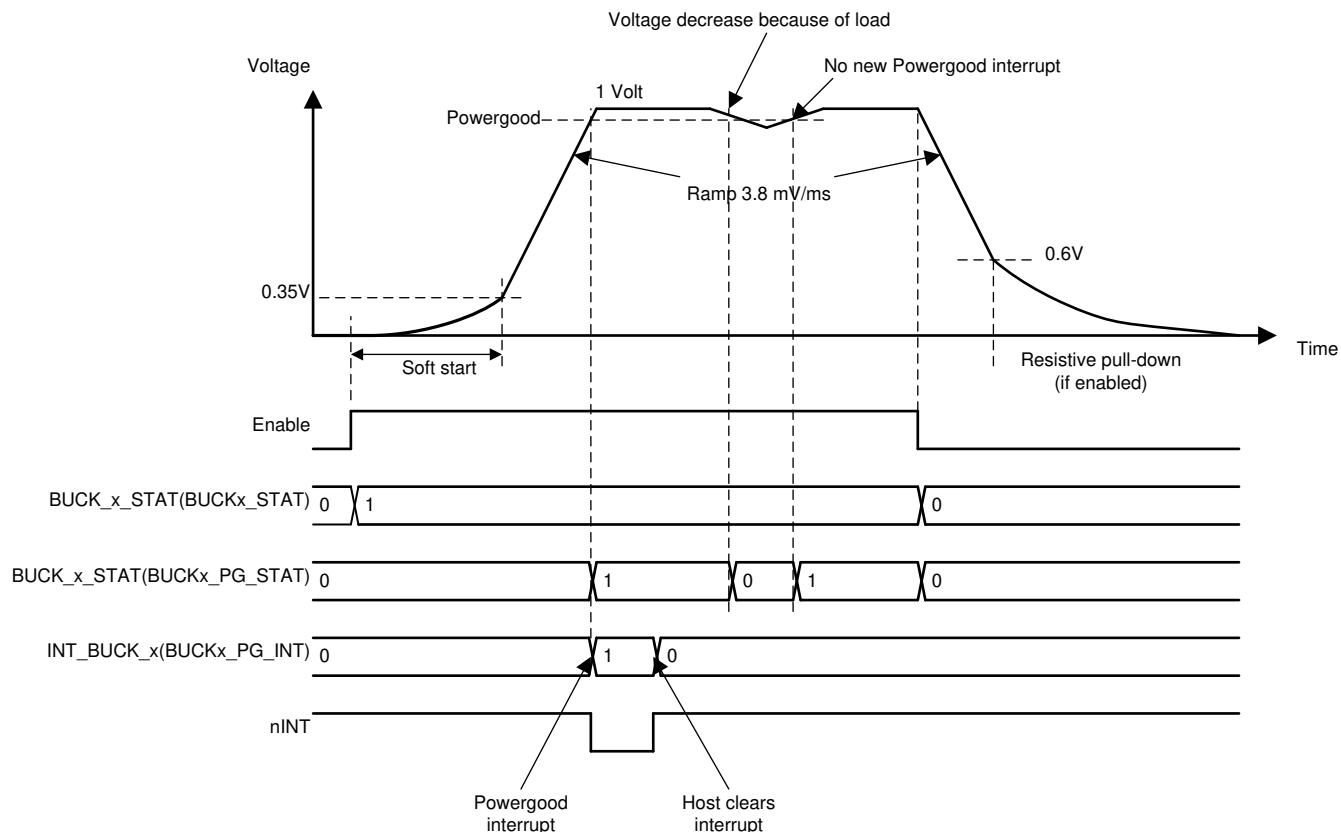

The control of the regulator cannot be changed from one ENx pin to a different ENx pin because the control is ENx signal edge sensitive. The control from ENx pin to register bit and back to the original ENx pin can be done during operation.

Table 3. Regulator Control

CONTROL METHOD	EN_BUCK0	EN_PIN_CTRL0	BUCK0_EN_PIN_SELECT[1:0]	EN1 PIN	EN2 PIN	EN3 PIN	BUCKx OUTPUT VOLTAGE
Enable and disable control with EN_BUCK0 bit	0h	Don't Care	Don't Care	Don't Care	Don't Care	Don't Care	Disabled
	1h	0h	Don't Care	Don't Care	Don't Care	Don't Care	1.0 Volt
Enable and disable control with EN1 pin	1h	1h	0h	Low	Don't Care	Don't Care	Disabled
	1h	1h	0h	High	Don't Care	Don't Care	1.0 Volt
Enable and disable control with EN2 pin	1h	1h	1h	Don't Care	Low	Don't Care	Disabled
	1h	1h	1h	Don't Care	High	Don't Care	1.0 Volt
Enable and disable control with EN3 pin	1h	1h	2h	Don't Care	Don't Care	Low	Disabled
	1h	1h	2h	Don't Care	Don't Care	High	1.0 Volt

The regulator is enabled by the ENx pin or by I²C writing as shown in [Figure 8](#). The soft-start circuit limits the in-rush current during start-up. When the output voltage rises to 0.35-V level, the output voltage becomes slew-rate controlled. If there is a short circuit at the output and the output voltage does not increase above 0.35-V level in 1 ms, the regulator is disabled, and interrupt is set. When the output voltage reaches the Power-Good threshold level the BUCKx_PG_INT interrupt flag (in INT_BUCK_x register) is set. The Power-Good interrupt flag can be masked using BUCKx_PG_MASK bit (in BUCKx_MASK register).

The ENx input pins have integrated pulldown resistors. The pulldown resistors are enabled by default, and the host can disable those with ENx_PD bits (in CONFIG register).

Figure 8. Regulator Enable and Disable

7.3.5 Enable and Disable Sequences

The LP875701-Q1 device supports start-up and shutdown sequencing with programmable delay for the regulator output using one EN1, EN2, or EN3 control signal. The regulator is selected for delayed control with:

- EN_BUCK0 = 1 (in BUCK0_CTRL1 register)
- EN_PIN_CTRL0 = 1 (in BUCK0_CTRL1 register)
- The ENABLE pin for control is selected with BUCK0_EN_PIN_SELECT[1:0] (in BUCK0_CTRL1 register)
- The delay from rising edge of ENx signal to the regulator enable is set by BUCK0_STARTUP_DELAY[3:0] bits (in BUCK0_DELAY register) and
- The delay from falling edge of ENx signal to the regulator disable is set by BUCK0_SHUTDOWN_DELAY[3:0] bits (in BUCK0_DELAY register)

There are four time steps available for start-up and shutdown sequences. The delay times are selected with DOUBLE_DELAY bit in CONFIG register and HALF_DELAY bit in PGOOD_CTRL2 register as shown in [Table 4](#).

Table 4. Start-Up and Shutdown Delays

0_STARTUP_DELAY or 0_SHUTDOWN_DELAY	DOUBLE_DELAY = 0h HALF_DELAY = 1h	DOUBLE_DELAY = 1h HALF_DELAY = 1h	DOUBLE_DELAY = 0h HALF_DELAY = 0h	DOUBLE_DELAY = 1h HALF_DELAY = 0h
0h	0 ms	0 ms	0 ms	0 ms
1h	0.32 ms	0.64 ms	1 ms	2 ms
2h	0.64 ms	1.28 ms	2 ms	4 ms
3h	0.96 ms	1.92 ms	3 ms	6 ms
4h	1.28 ms	2.56 ms	4 ms	8 ms
5h	1.6 ms	3.2 ms	5 ms	10 ms
6h	1.92 ms	3.84 ms	6 ms	12 ms
7h	2.24 ms	4.48 ms	7 ms	14 ms
8h	2.56 ms	5.12 ms	8 ms	16 ms
9h	2.88 ms	5.76 ms	9 ms	18 ms
Ah	3.2 ms	6.4 ms	10 ms	20 ms
Bh	3.52 ms	7.04 ms	11 ms	22 ms
Ch	3.84 ms	7.68 ms	12 ms	24 ms
dh	4.16 ms	8.32 ms	13 ms	26 ms
Eh	4.48 ms	8.96 ms	14 ms	28 ms
Fh	4.8 ms	9.6 ms	15 ms	30 ms

An example of start-up and shutdown sequences is shown in [Figure 9](#) and [Figure 10](#). The start-up and shutdown delays for the master buck regulator BUCK0 regulator is 1 ms and 4 ms . The delay settings are used only for enable/disable control with EN1, EN2, EN3 signals

Figure 9. Typical Start-Up and Shutdown Sequencing

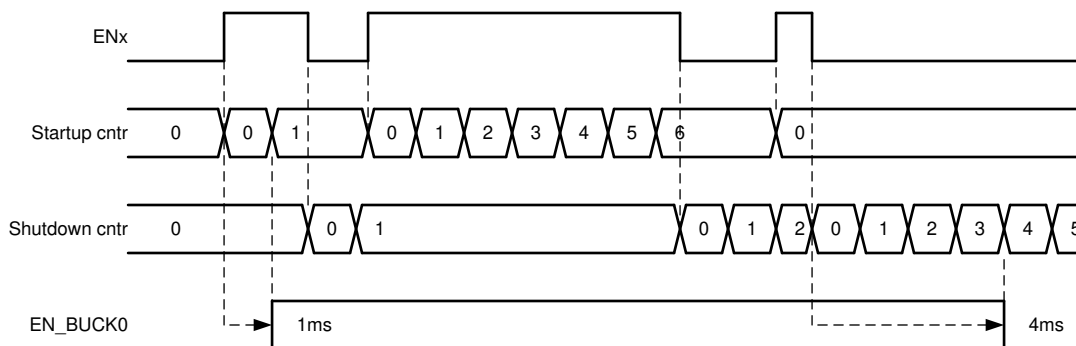

Figure 10. Start-Up and Shutdown Sequencing With Short ENx Low and High Periods

7.3.6 Device Reset Scenarios

There are three reset methods implemented on the LP875701-Q1 :

- Software reset with SW_RESET register bit (in RESET register)
- POR from rising edge of NRST signal
- Undervoltage lockout (UVLO) reset from VANA supply

A SW-reset occurs when SW_RESET bit is written 1. The bit is automatically cleared after writing. This event disables all the regulators immediately, resets all the register bits to the default values and OTP bits are loaded (see Figure 14). I²C interface is not reset during software reset. The host must wait at least 1.2 ms after writing SW reset until making a new I²C read or write to the device.

If VANA supply voltage falls below UVLO threshold level or NRST signal is set low then all the regulators are disabled immediately, and all the register bits are reset to the default values. When the VANA supply voltage rises above UVLO threshold level AND NRST signal rises above threshold level an internal power-on reset (POR) occurs. OTP bits are loaded to the registers and a start-up is initiated according to the register settings. The host must wait at least 1.2 ms after POR until reading or writing to I²C interface.

7.3.7 Diagnosis and Protection Features

The LP875701-Q1 is capable of providing four levels of protection features:

- Information of valid regulator output voltage which sets interrupt or PGOOD signal;
- Warnings for diagnosis which sets interrupt;
- Protection events which are disabling the regulators affected; and
- Faults which are causing the device to shutdown.

The LP875701-Q1 sets the flag bits indicating what protection or warning conditions have occurred, and the nINT pin is pulled low. nINT is released again after a clear of flags is complete. The nINT signal stays low until all the pending interrupts are cleared.

When a fault is detected, it is indicated by a RESET_REG interrupt flag (in INT2_TOP register) after next start-up.

Table 5. Summary of Interrupt Signals

EVENT	RESULT	INTERRUPT REGISTER AND BIT	INTERRUPT MASK	STATUS BIT	RECOVERY/INTERRUPT CLEAR
Current limit triggered (20- μ s debounce)	Interrupt	INT_BUCKx = 1 BUCKx_ILIM_INT = 1	BUCKx_ILIM_MASK	BUCKx_ILIM_STAT	Write 1 to BUCKx_ILIM_INT bit Interrupt is not cleared if current limit is active
Short circuit ($V_{OUT} < 0.35$ V at 1 ms after enable) or overload (V_{OUT} decreasing below 0.35 V during operation, 1 ms debounce)	Regulator disable and interrupt	INT_BUCKx = 1 BUCKx_SC_INT = 1	N/A	N/A	Write 1 to BUCKx_SC_INT bit
Thermal warning	Interrupt	TDIE_WARN = 1	TDIE_WARN_MASK	TDIE_WARN_STAT	Write 1 to TDIE_WARN bit Interrupt is not cleared if temperature is above thermal warning level
Thermal shutdown	All regulators disabled and Output GPIOx set to low and interrupt	TDIE_SD = 1	N/A	TDIE_SD_STAT	Write 1 to TDIE_SD bit Interrupt is not cleared if temperature is above thermal shutdown level
VANA overvoltage ($VANA_{OVP}$)	All regulators disabled and Output GPIOx set to low and interrupt	INT_OVP	N/A	OVP_STAT	Write 1 to INT_OVP bit Interrupt is not cleared if VANA voltage is above VANA OVP level
Power Good, output voltage reaches the programmed value	Interrupt	INT_BUCKx = 1 BUCKx_PG_INT = 1	BUCKx_PG_MASK	BUCKx_PG_STAT	Write 1 to BUCKx_PG_INT bit
GPIO	Interrupt	INT_GPIO	GPIO_MASK	GPIO_IN register	Write 1 to INT_GPIO bit
External clock appears or disappears	Interrupt	NO_SYNC_CLK ⁽¹⁾	SYNC_CLK_MASK	SYNC_CLK_STAT	Write 1 to NO_SYNC_CLK bit
Load current measurement ready	Interrupt	I_LOAD_READY = 1	I_LOAD_READY_MASK	N/A	Write 1 to I_LOAD_READY bit

(1) Interrupt is generated during clock detector operation and in case clock is not available when clock detector is enabled.

Table 5. Summary of Interrupt Signals (continued)

EVENT	RESULT	INTERRUPT REGISTER AND BIT	INTERRUPT MASK	STATUS BIT	RECOVERY/INTERRUPT CLEAR
Start-Up (NRST rising edge)	Device ready for operation, registers reset to default values and interrupt	RESET_REG = 1	RESET_REG_MASK	N/A	Write 1 to RESET_REG bit
Glitch on supply voltage and UVLO triggered (VANA falling and rising)	Immediate shutdown followed by power up, registers reset to default values and interrupt	RESET_REG = 1	RESET_REG_MASK	N/A	Write 1 to RESET_REG bit
Software requested reset	Immediate shutdown followed by power up, registers reset to default values and interrupt	RESET_REG = 1	RESET_REG_MASK	N/A	Write 1 to RESET_REG bit

7.3.7.1 Power-Good Information (PGOOD pin)

In addition to the interrupt based indication of current limit and Power-Good level the LP875701-Q1 device supports the indication with PGOOD signal. Either voltage and current monitoring or a voltage monitoring only can be selected for PGOOD indication. This selection is individual for all buck regulators (select master phase for multiphase regulator) and is set by PGx_SEL[1:0] bits (in PGOOD_CTRL1 register). When both voltage and current are monitored, PGOOD signal active indicates that regulator output is inside the Power-Good voltage window and that load current is below I_{LIM_FWD} . If only voltage is monitored, then the current monitoring is ignored for the PGOOD signal. When a regulator is disabled, the monitoring is automatically masked to prevent it forcing PGOOD inactive. This allows connecting PGOOD signals from various devices together when open-drain outputs are used. When regulator voltage is transitioning from one target voltage to another, the voltage monitoring PGOOD signal is set inactive. The monitoring from all the output rails are combined, and PGOOD is active only if all the sources shows active status. The status from all the voltage rails are summarized in [Table 6](#).

If the PGOOD signal is inactive or it changes the state to inactive, the source for the state can be read from PGOOD_FLT register. During reading all the PGx_FLT bit are cleared that are not driving the PGOOD inactive. When PGOOD signal goes active, the host must read the PGOOD_FLT register to clear all the bits. The PGOOD signal follows the status of all the monitored outputs.

The PGOOD signal can be also configured so that it stays in the inactive state even when the monitored outputs are valid but there are PGx_FLT bits pending clearance in PGOOD_FLT register. This mode of operation is selected by setting EN_PGFLT_STAT bit to 1 (in PGOOD_CTRL2 register).

The type of output voltage monitoring for PGOOD signal is selected by PGOOD_WINDOW bit (in PGOOD_CTRL2 register). If the bit is 0, only undervoltage is monitored; if the bit is 1, both undervoltage and overvoltage are monitored.

The polarity and the output type (push-pull or open-drain) are selected by PGOOD_POL and PGOOD_OD bits in PGOOD_CTRL2 register.

The filtering time for invalid output voltage is always typically 7 μ s and for valid output voltage the filtering time is selected with PGOOD_SET_DELAY bit (in PGOOD_CTRL2 register). The Power-Good waveforms are shown in [Figure 12](#).

Figure 11. PGOOD Block Diagram

Table 6. PGOOD Operation

STATUS / USE CASE	CONDITION	INPUT TO PGOOD SIGNAL
Buck not selected for PGOOD monitoring	PGx_SEL = 00 (in PGOOD_CTRL1 register)	Active
Buck disabled		Active

Table 6. PGOOD Operation (continued)

STATUS / USE CASE	CONDITION	INPUT TO PGOOD SIGNAL
BUCK SELECTED FOR PGOOD MONITORING		
Buck start-up delay		Inactive
Buck soft start	$V_{OUT} < 0.35\text{ V}$	Inactive
Buck voltage ramp-up	$0.35\text{ V} < V_{OUT} < V_{SET}$	Inactive
Output voltage within window limits after start-up	Must be inside limits longer than debounce time	Active
Output voltage inside voltage window and current limit active	Current limit active longer than debounce time	Active (if only voltage monitoring selected) Inactive (if also current monitoring selected)
Output voltage spikes (overvoltage or undervoltage)	If spikes are outside voltage window longer than debounce time	Inactive
Voltage setting change, output voltage ramp		Inactive
Output voltage within window limits after voltage change	Must be inside limits longer than debounce time	Active
Buck shutdown delay		Active
Buck output voltage ramp down		Active
Buck disabled by thermal shutdown and interrupt pending		Inactive
Buck disabled by overvoltage and interrupt pending		Inactive
Buck disabled by short-circuit detection and interrupt pending		Inactive

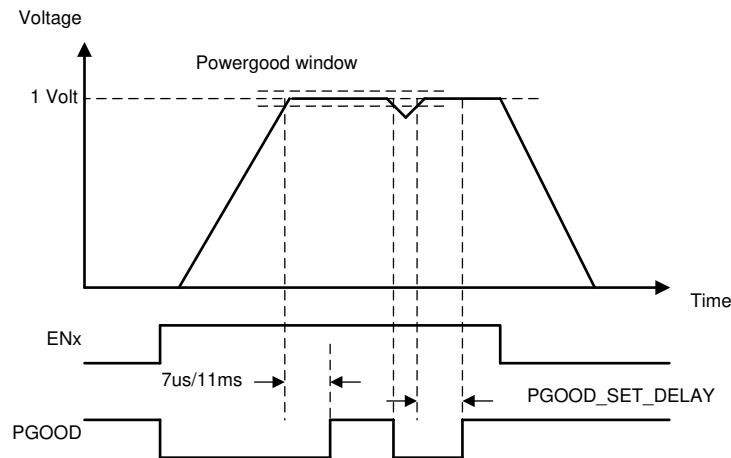

Figure 12. PGOOD Waveforms (PGOOD_POL=0)

7.3.7.2 Warnings for Diagnosis (Interrupt)

7.3.7.2.1 Output Power Limit

The regulators have output peak current limits. The peak current limits are described in Electrical Characteristic Table. If the load current is increased so that the current limit is triggered, the regulator continues to regulate to the limit current level (current peak regulation, peak on each switching cycle). The voltage may decrease if the load current is higher than the average output current. If the current regulation continues for 20 μs , the LP875701-Q1 device sets the BUCKx_ILIM_INT bit (in INT_BUCKx register) and pulls the nINT pin low. The host processor can read BUCKx_ILIM_STAT bits (in BUCKx_STAT register) to see if the regulator is still in peak current regulation mode.

If the load is so high that the output voltage decreases below a 350-mV level, the LP875701-Q1 device disables the regulator and sets the BUCKx_SC_INT bit (in INT_BUCKx register). In addition the BUCKx_STAT bit (in BUCKx_STAT register) is set to 0. The interrupt is cleared when the host processor writes 1 to BUCKx_SC_INT bit. The overload situation is shown in Figure 13.

Figure 13. Overload Situation

7.3.7.2.2 Thermal Warning

The LP875701-Q1 device includes a monitoring feature against overtemperature by setting an interrupt for host processor. The threshold level of the thermal warning is selected with TDIE_WARN_LEVEL bit (in CONFIG register).

If the LP875701-Q1 device temperature increases above thermal warning level the device sets TDIE_WARN bit (in INT_TOP1 register) and pulls nINT pin low. The status of the thermal warning can be read from TDIE_WARN_STAT bit (in TOP_STAT register), and the interrupt is cleared by writing 1 to TDIE_WARN bit.

7.3.7.3 Protection (Regulator Disable)

If the regulator is disabled because of protection or fault (short-circuit protection, overload protection, thermal shutdown, overvoltage protection, or UVLO), the output power FETs are set to high-impedance mode, and the output pulldown resistor is enabled (if enabled with EN_RDISx bits in BUCKx_CTRL1 register). The turnoff time of the output voltage is defined by the output capacitance, load current, and the resistance of the integrated pulldown resistor. The pulldown resistors are active as long as VANA voltage is above approximately a 1.2-V level.

7.3.7.3.1 Short-Circuit and Overload Protection

A short-circuit protection feature lets the LP875701-Q1 device protect itself and external components against short circuit at the output or against overload during start-up. The fault threshold is 350 mV, the protection is triggered, and the regulator is disabled if the output voltage is below the threshold level 1 ms after the regulator is enabled.

In a similar way the overload situation is protected during normal operation. If the voltage on the feedback pin of the regulator falls to less than 0.35 V and stays lower the threshold level for 1 ms, the regulator is disabled.

In the short-circuit and overload situations the BUCKx_SC_INT (in INT_BUCKx register) and the INT_BUCKx bits (in INT_TOP1 register) are set to 1, the BUCKx_STAT bit (in BUCKx_STAT register) is set to 0, and the nINT signal is pulled low. The host processor clears the interrupt by writing 1 to the BUCKx_SC_INT bit. After clearing the interrupt the regulator makes a new start-up attempt if the regulator is in enabled state.

7.3.7.3.2 Overvoltage Protection

The LP875701-Q1 device monitors the input voltage from the VANA pin in standby and active operation modes. If the input voltage rises above $VANA_{OVP}$ voltage level, all the regulators are disabled, pulldown resistors discharge the output voltages (if $EN_{RDISx} = 1$ in BUCKx_CTRL1 register), GPIOs that are configured to outputs are set to logic low level, nINT signal is pulled low, INT_OVP bit (in INT_TOP1 register) is set to 1, and BUCKx_STAT bits (in BUCK_x_STAT register) are set to 0. The host processor clears the interrupt by writing 1 to the INT_OVP bit. If the input voltage is above the overvoltage detection level the interrupt is not cleared. The host can read the status of the overvoltage from the OVP_STAT bit (in TOP_STAT register). Regulators cannot be enabled as long as the input voltage is above overvoltage detection level or the overvoltage interrupt is pending.

7.3.7.3.3 Thermal Shutdown

The LP875701-Q1 has an overtemperature protection function that operates to protect the device from short-term misuse and overload conditions. When the junction temperature exceeds around 150°C, the regulators are disabled, the TDIE_SD bit (in INT_TOP1 register) is set to 1, the nINT signal is pulled low, and the device goes to the STANDBY state. The nINT pin is cleared by writing 1h to the TDIE_SD bit. If the temperature is above thermal shutdown level the interrupt is not cleared. The host can read the status of the thermal shutdown from the TDIE_SD_STAT bit (in TOP_STAT register). Regulators cannot be enabled as long as the junction temperature is above thermal shutdown level or the thermal shutdown interrupt is pending.

7.3.7.4 Fault (Power Down)

7.3.7.4.1 Undervoltage Lockout

When the input voltage falls below $VANA_{UVLO}$ at the VANA pin, the buck converters are disabled immediately, and the output capacitors are discharged using the pulldown resistor, and the LP875701-Q1 device goes to the SHUTDOWN state. When the VANA voltage is greater than the UVLO threshold level and NRST signal is high, the device powers up to STANDBY state.

If the reset interrupt is unmasked by default ($RESET_REG_MASK = 0$ in TOP_MASK2 register) the RESET_REG interrupt (in INT_TOP2 register) indicates that the device has been in SHUTDOWN. The host processor must clear the interrupt by writing 1 to the RESET_REG bit. If the host processor reads the RESET_REG flag after detecting an nINT low signal, it knows that the input supply voltage has been below UVLO level (or the host has requested reset), and the registers are reset to default values.

7.3.8 GPIO Signal Operation

The LP875701-Q1 device supports up to 3 GPIO signals. The GPIO signals are multiplexed with enable signals. The selection between enable and GPIO function is set with GPIOx_SEL bits in PIN_FUNCTION register. The GPIOs are mapped to EN signals so that:

- EN1 is multiplexed with GPIO1
- EN2 is multiplexed with GPIO2
- EN3 is multiplexed with GPIO3

When the pin is selected for GPIO function, additional bits defines how the GPIO operates:

- GPIOx_DIR defines the direction of the GPIO, input or output (GPIO_CONFIG register)
- GPIOx_OD defines the type of the output when the GPIO is set to output, either push-pull with VANA level or open-drain (GPIO_CONFIG register)

When the GPIOx is defined as output, the logic level of the pin is set by GPIOx_OUT bit (in GPIO_OUT register).

When the GPIOx is defined as input, the logic level of the pin can be read from GPIOx_IN bit (in GPIO_IN register).

The control of the GPIOs configured to outputs can be included to start-up and shutdown sequences. The GPIO control for a sequence with ENx signal is selected by EN_PIN_CTRL_GPIOx and EN_PIN_SELECT_GPIOx bits (in PIN_FUNCTION register). The delays during start-up and shutdown are set by GPIOx_STARTUP_DELAY[3:0] and GPIOx_SHUTDOWN_DELAY[3:0] bits (in GPIOx_DELAY register) in the same way as control of the regulators.

The GPIOx signals have a selectable pulldown resistor. The pulldown resistors are selected by ENx_PD bits (in CONFIG register).

NOTE

The control of the GPIOx pin cannot be changed from one ENx pin to a different ENx pin because the control is ENx signal edge sensitive. The control from ENx pin to register bit and back to the original ENx pin can be done during operation.

7.3.9 Digital Signal Filtering

The digital signals have a debounce filtering. The signal/supply is sampled with a clock signal and a counter. This results as an accuracy of one clock period for the debounce window.

Table 7. Digital Signal Filtering

EVENT	SIGNAL/SUPPLY	RISING EDGE DEBOUNCE TIME	FALLING EDGE DEBOUNCE TIME
Enable and disable for BUCKx	EN1	3 μ s ⁽¹⁾	3 μ s ⁽¹⁾

(1) No glitch filtering, only synchronization.

7.4 Device Functional Modes

7.4.1 Modes of Operation

SHUTDOWN: The NRST voltage is below threshold level. All switch, reference, control, and bias circuitry of the LP875701-Q1 device are turned off.

READ OTP: The primary supply voltage VANA is above $VANA_{UVLO}$ level and NRST voltage is above threshold level. The regulators are disabled and the reference and bias circuitry of the LP875701-Q1 are enabled. The OTP bits are loaded to registers.

STANDBY: The primary supply voltage VANA is above $VANA_{UVLO}$ level and NRST voltage is above threshold level. The regulators are disabled and the reference, control and bias circuitry of the LP875701-Q1 are enabled. All registers can be read or written by the host processor via the system serial interface. The regulators can be enabled if needed.

ACTIVE: The primary supply voltage VANA is above $VANA_{UVLO}$ level and NRST voltage is above threshold level. At least one regulated DC/DC converter is enabled. All registers can be read or written by the host processor via the system serial interface.

The operating modes and transitions between the modes are shown in [Figure 14](#).

Device Functional Modes (continued)

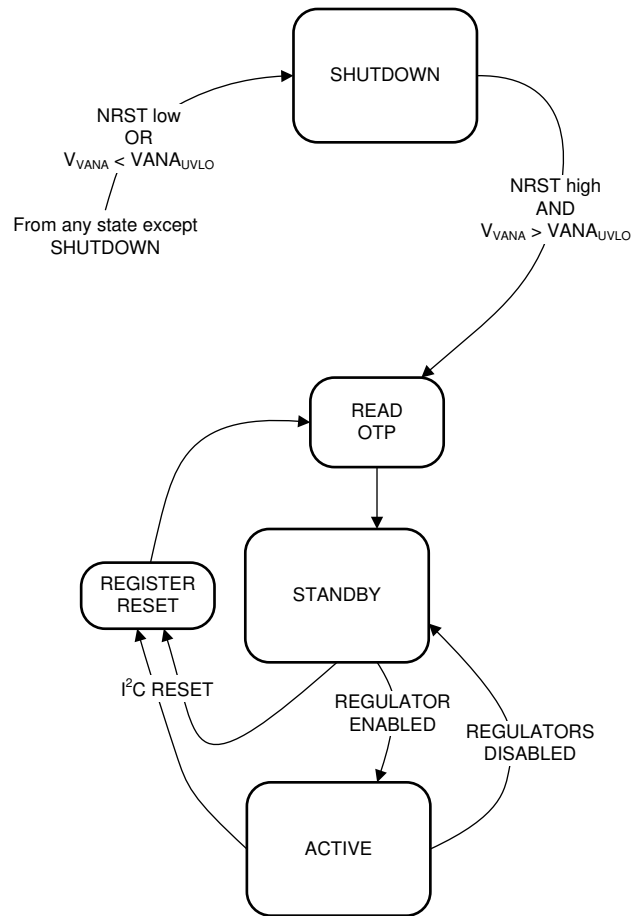

Figure 14. Device Operation Modes

7.5 Programming

7.5.1 I²C-Compatible Interface

The I²C-compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the devices connected to the bus. The two interface lines are the serial data line (SDA), and the serial clock line (SCL). Each device on the bus is assigned a unique address and acts as either a master or a slave depending on whether it generates or receives the serial clock SCL. The SCL and SDA lines must each have a pullup resistor placed somewhere on the line and stays HIGH even when the bus is idle. Note: CLK pin is not used for serial bus data transfer. The LP875701-Q1 supports standard mode (100 kHz), fast mode (400 kHz), fast mode+ (1 MHz), and high-speed mode (3.4 MHz).

7.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, the state of the data line can only be changed when clock signal is LOW.

Figure 15. Data Validity Diagram

7.5.1.2 Start and Stop Conditions

The LP875701-Q1 is controlled via an I²C-compatible interface. START and STOP conditions classify the beginning and end of the I²C session. A START condition is defined as SDA transitions from HIGH to LOW while SCL is HIGH. A STOP condition is defined as SDA transition from LOW to HIGH while SCL is HIGH. The I²C master always generates the START and STOP conditions.

Figure 16. Start and Stop Sequences

The I²C bus is considered busy after a START condition and free after a STOP condition. During data transmission the I²C master can generate repeated START conditions. A START and a repeated START condition are equivalent function-wise. The data on SDA must be stable during the HIGH period of the clock signal (SCL). In other words, the state of SDA can only be changed when SCL is LOW. Figure 17 shows the SDA and SCL signal timing for the I²C-compatible bus.

Programming (continued)

Figure 17. I²C-Compatible Timing

7.5.1.3 Transferring Data

Each byte put on the SDA line must be eight bits long, with the most significant bit (MSB) being transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the master. The master releases the SDA line (HIGH) during the acknowledge clock pulse. The LP875701-Q1 pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The LP875701-Q1 generates an acknowledge after each byte has been received.

There is one exception to the *acknowledge after each byte* rule. When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (*negative acknowledge*) the last byte clocked out of the slave. This *negative acknowledge* still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

NOTE

If the NRST signal is low during I²C communication the LP875701-Q1 device does not drive SDA line. The ACK signal and data transfer to the master is disabled at that time.

After the START condition, the bus master sends a chip address. This address is seven bits long followed by an eighth bit which is a data direction bit (READ or WRITE). For the eighth bit, a 0 indicates a WRITE and a 1 indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

Figure 18. Write Cycle (w = write; SDA = 0), id = Device Address = 0x60 for LP875701-Q1

Programming (continued)

When READ function is to be accomplished, a WRITE function must precede the READ function as shown above.

Figure 19. Read Cycle (r = read; SDA = 1), id = Device Address = 0x60 for LP875701-Q1

7.5.1.4 I²C-Compatible Chip Address

NOTE

The device address for the LP875701-Q1 is defined in the Technical Reference Manual (TRM).

After the START condition, the I²C master sends the 7-bit address followed by an eighth bit, read or write (R/W). R/W = 0 indicates a WRITE and R/W = 1 indicates a READ. The second byte following the device address selects the register address to which the data will be written. The third byte contains the data for the selected register.

A. Here device address is 1100000Bin = 60Hex.

Figure 20. Example Device Address

7.5.1.5 Auto-Increment Feature

The auto-increment feature allows writing several consecutive registers within one transmission. Each time an 8-bit word is sent to the device, the internal address index counter is incremented by one and the next register is written. Table 8 below shows writing sequence to two consecutive registers. Note that auto increment feature does not work for read.

Table 8. Auto-Increment Example

MASTER ACTION	START	DEVICE ADDRESS = 0x60	WRITE	REGISTER ADDRESS	DATA	DATA	STOP
LP875701-Q1			ACK		ACK	ACK	ACK

7.6 Register Maps

7.6.1 Register Descriptions

The LP875701-Q1 is controlled by a set of registers through the I²C-compatible interface. The device registers, their addresses, and their abbreviations are listed in [Table 9](#). A more detailed description is given in the [OTP_REV](#) to [GPIO_OUT](#) sections.

NOTE

This register map describes the default values for bits which are not read from OTP memory. The orderable code and the default register bit values are defined in part number specific Technical Reference Manual.

0	Reserved	R/W	X	Reserved, do not use

7.6.1.4 BUCK0_DELAY

Address: 0x12

D7	D6	D5	D4	D3	D2	D1	D0
BUCK0_SHUTDOWN_DELAY[3:0]				BUCK0_STARTUP_DELAY[3:0]			
Bits	Field	Type	Default	Description			
7:4	BUCK0_SHUTDOWN_DELAY[3:0]	R/W	X	Shutdown delay of the BUCK0 regulator from the falling edge of the ENx signal (the DOUBLE_DELAY bit is set to 0h in the CONFIG register and the HALF_DELAY bit is set to 0h in the PGOOD_CTRL2 register). For other delay options, see the <i>Start-Up and Shutdown Delays</i> table. 0h = 0 ms 1h = 1 ms Fh = 15 ms			
3:0	BUCK0_STARTUP_DELAY[3:0]	R/W	X	Start-Up delay the of the BUCK0 regulator from the rising edge of the ENx signal (the DOUBLE_DELAY bit is set to 0h in the CONFIG register and the HALF_DELAY bit is set to 0h in the PGOOD_CTRL2 register). For other delay options, see the <i>Start-Up and Shutdown Delays</i> table. 0h = 0 ms 1h = 1 ms Fh = 15 ms			

7.6.1.5 GPIO2_DELAY

Address: 0x16

D7	D6	D5	D4	D3	D2	D1	D0
GPIO2_SHUTDOWN_DELAY[3:0]				GPIO2_STARTUP_DELAY[3:0]			
Bits	Field	Type	Default	Description			
7:4	GPIO2_SHUTDOWN_DELAY[3:0]	R/W	X	Delay for the GPIO2 falling edge from the falling edge of the ENx signal (the DOUBLE_DELAY bit is set to 0h in the CONFIG register and the HALF_DELAY bit is set to 0h in the PGOOD_CTRL2 register). For other delay options, see the <i>Start-Up and Shutdown Delays</i> table. 0h = 0 ms 1h = 1 ms Fh = 15 ms			
3:0	GPIO2_STARTUP_DELAY[3:0]	R/W	X	Delay for the GPIO2 rising edge from the rising edge of the ENx signal (the DOUBLE_DELAY bit is set to 0h in the CONFIG register and the HALF_DELAY bit is set to 0h in the PGOOD_CTRL2 register). For other delay options, see the <i>Start-Up and Shutdown Delays</i> table. 0h = 0 ms 1h = 1 ms Fh = 15 ms			

7.6.1.6 GPIO3_DELAY

Address: 0x17

D7	D6	D5	D4	D3	D2	D1	D0
GPIO3_SHUTDOWN_DELAY[3:0]				GPIO3_STARTUP_DELAY[3:0]			
Bits	Field	Type	Default	Description			
7:4	GPIO3_SHUTDOWN_DELAY[3:0]	R/W	X	Delay for the GPIO3 falling edge from the falling edge of the ENx signal (the DOUBLE_DELAY bit is set to 0h in the CONFIG register and the HALF_DELAY bit is set to 0h in the PGOOD_CTRL2 register). For other delay options, see the <i>Start-Up and Shutdown Delays</i> table. 0h = 0 ms 1h = 1 ms Fh = 15 ms			
3:0	GPIO3_STARTUP_DELAY[3:0]	R/W	X	Delay for GPIO3 rising edge from rising edge of ENx signal (the DOUBLE_DELAY bit is set to 0h in the CONFIG register and the HALF_DELAY bit is set to 0h in the PGOOD_CTRL2 register). For other delay options, see the <i>Start-Up and Shutdown Delays</i> table. 0h = 0 ms 1h = 1 ms . Fh = 15 ms			

7.6.1.7 RESET

Address: 0x18

D7	D6	D5	D4	D3	D2	D1	D0
Reserved							SW_RESET
Bits	Field	Type	Default	Description			
7:1	Reserved	R/W	0h				
0	SW_RESET	R/W	0h	Software commanded reset. When this bit is written to 1h, the registers are reset to the default values, OTP memory is read, and the I ² C interface is reset. The bit is automatically cleared.			

7.6.1.8 CONFIG

Address: 0x19

D7	D6	D5	D4	D3	D2	D1	D0
DOUBLE_DELAY	CLKIN_PD	Reserved	EN3_PD	TDIE_WARN_LEVEL	EN2_PD	EN1_PD	Reserved
Bits	Field	Type	Default	Description			
7	DOUBLE_DELAY	R/W	X	Start-Up and shutdown delays from the ENx signals 0h = 0 ms to 15 ms with 1-ms steps 1h = 0 ms to 30 ms with 2-ms steps			
6	CLKIN_PD	R/W	X	This bit selects the pulldown resistor on the CLKIN input pin. 0h = Pulldown resistor is disabled 1h = Pulldown resistor is enabled			
5	Reserved	R/W	0h				
4	EN3_PD	R/W	X	This bit selects the pulldown resistor on the EN3 (GPIO3) input pin. 0h = Pulldown resistor is disabled 1h = Pulldown resistor is enabled			
3	TDIE_WARN_LEVEL	R/W	X	Thermal warning threshold level 0h = 125°C 1h = 137°C			
2	EN2_PD	R/W	X	This bit selects the pulldown resistor on the EN2 (GPIO2) input pin. 0h = Pulldown resistor is disabled 1h = Pulldown resistor is enabled			

Bits	Field	Type	Default	Description
1	EN1_PD	R/W	X	This bit selects the pull-down resistor on the EN1 (GPIO1) input pin. 0h = Pull-down resistor is disabled 1h = Pull-down resistor is enabled
0	Reserved	R/W	0h	

7.6.1.9 INT_TOP1

Address: 0x1A

D7	D6	D5	D4	D3	D2	D1	D0
Reserved	INT_BUCK23	INT_BUCK01	NO_SYNC_CLK	TDIE_SD	TDIE_WARN	INT_OVP	I_LOAD_READY
Bits	Field	Type	Default	Description			
7	Reserved	R/W	0h				
6	INT_BUCK23	R	0h	Interrupt indicating that the output of the BUCK3 regulator, BUCK2 regulator, or both regulators has a pending interrupt. The reason for the interrupt is indicated in the INT_BUCK_2_3 register. This bit is cleared automatically when the INT_BUCK_2_3 register is cleared to 0x00.			
5	INT_BUCK01	R	0h	Interrupt indicating that the output of the BUCK1 regulator, BUCK0 regulator, or both regulators has a pending interrupt. The reason for the interrupt is indicated in the INT_BUCK_0_1 register. This bit is cleared automatically when the INT_BUCK_0_1 register is cleared to 0x00.			
4	NO_SYNC_CLK	R/W1C	0h	Latched status bit indicating that the external clock is not valid. Write this bit to 1h to clear the interrupt.			
3	TDIE_SD	R/W1C	0h	Latched status bit indicating that the die junction temperature is greater than the thermal shutdown level. The regulators are disabled if previously enabled. The regulators cannot be enabled if this bit is active. The actual status of the thermal warning condition is indicated by the TDIE_SD_STAT bit in the TOP_STAT register. Write this bit to 1h to clear the interrupt.			
2	TDIE_WARN	R/W1C	0h	Latched status bit indicating that the die junction temperature is greater than the thermal warning level. The actual status of the thermal warning condition is indicated by the TDIE_WARN_STAT bit in the TOP_STAT register. Write this bit to 1h to clear the interrupt.			
1	INT_OVP	R/W1C	0h	Latched status bit indicating that the input voltage is greater than the overvoltage-detection level. The actual status of the overvoltage condition is indicated by the OVP_STAT bit in the OP_STAT register. Write this bit to 1h to clear the interrupt.			
0	I_LOAD_READY	R/W1C	0h	Latched status bit indicating that the load-current measurement result is available in the I_LOAD_1 and I_LOAD_2 registers. Write this bit to 1h to clear the interrupt.			

7.6.1.10 INT_TOP2

Address: 0x1B

D7	D6	D5	D4	D3	D2	D1	D0
Reserved							RESET_REG
Bits	Field	Type	Default	Description			
7:1	Reserved	R/W	0h				
0	RESET_REG	R/W1C	0h	Latched status bit indicating that either start-up (NRST rising edge) is done, VANA supply voltage is less than the undervoltage threshold level, or the host has requested a reset (the SW_RESET bit in the RESET register). The regulators are disabled, the registers are reset to default values, and the normal start-up procedure is done. Write this bit to 1h to clear the interrupt.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LP875701-Q1 is a multiphase step-down converter with four switcher cores, which is configured as a single output 4-phase regulator.

8.2 Typical Application

Figure 21. 4-Phase Configuration

8.2.1 Design Requirements

8.2.1.1 Inductor Selection

The inductors L_0 , L_1 , L_2 , and L_3 are shown in the [Typical Application](#). The inductance and DCR of the inductor affects the control loop of the buck regulator. TI recommends using inductors similar to those listed in [Table 11](#). Pay attention to the saturation current and temperature rise current of the inductor. Check that the saturation current is higher than the peak current limit and the temperature rise current is higher than the maximum expected rms output current. The minimum effective inductance to make sure performance is good is $0.22 \mu\text{H}$ at maximum peak output current over the operating temperature range. DC resistance of the inductor must be less than 0.05Ω for good efficiency at high-current condition. The inductor AC loss (resistance) also affects conversion efficiency. Higher Q factor at switching frequency usually gives better efficiency at light load to middle load. Shielded inductors are preferred as they radiate less noise.

Typical Application (continued)
Table 11. Recommended Inductors

MANUFACTURER	PART NUMBER	VALUE	DIMENSIONS L × W × H (mm)	RATED DC CURRENT, I _{SAT} maximum (typical) / I _{TEMP} maximum (typical) (A)	DCR typical / maximum (mΩ)
Murata	DFE252012PD-R33M	0.33 μH (20%)	2.5 × 2 × 1.2	6.0 (-) / 4.6 (-) ⁽¹⁾	- / 23

(1) Operating temperature range is up to 125°C including self temperature rise.

8.2.1.2 Input Capacitor Selection

The input capacitors C_{IN0}, C_{IN1}, C_{IN2}, and C_{IN3} are shown in the [Typical Application](#). A ceramic input bypass capacitor of 10 μF is required for each phase of the regulator. Place the input capacitor as close as possible to the VIN_Bx pin and PGND_Bx pin of the device. A larger value or higher voltage rating improves the input voltage filtering. Use X7R type of capacitors, not Y5V or F. DC bias characteristics capacitors must be considered. The minimum effective input capacitance to make sure performance is good is 1.9 μF for each buck input at the maximum input voltage including tolerances and ambient temperature range. This value assumes that at least 22 μF of additional capacitance is common for all the power input pins on the system power rail. See [Table 12](#).

The input filter capacitor supplies current to the high-side FET switch in the first half of each cycle and decreases voltage ripple imposed on the input power source. A ceramic capacitor's low ESR provides the best noise filtering of the input voltage spikes due to this rapidly changing current. Select an input filter capacitor with sufficient ripple current rating. In addition ferrite can be used in front of the input capacitor to decrease the EMI.

Table 12. Recommended Input Capacitors (X7R Dielectric)

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L × W × H (mm)	VOLTAGE RATING (V)
Murata	GCM21BR71A106KE22	10 μF (10%)	0805	2 × 1.25 × 1.25	10 V

8.2.1.3 Output Capacitor Selection

The output capacitors C_{OUT0}, C_{OUT1}, C_{OUT2}, and C_{OUT3} are shown in [Typical Application](#). A ceramic local output capacitor of 22 μF is required per phase. Use ceramic capacitors, X7R or X7T types; do not use Y5V or F. DC bias voltage characteristics of ceramic capacitors must be considered. The output filter capacitor smooths out current flow from the inductor to the load, helps keep a steady output voltage during transient load changes and decreases output voltage ripple. These capacitors must be selected with sufficient capacitance and sufficiently low ESR and ESL to do these functions. The minimum effective output capacitance to make sure performance is good is 10 μF for each phase including the DC voltage roll-off, tolerances, aging and temperature effects.

The output voltage ripple is caused by the charging and discharging of the output capacitor and also due to its R_{ESR}. The R_{ESR} is frequency dependent (as well as temperature dependent); make sure the value used for selection process is at the switching frequency of the part. See [Table 13](#).

POL capacitor (C_{POL0}) needs to be used to maintain output voltage stability and improve load transient performance and to decrease the ripple voltage. Note that the output capacitor may be the limiting factor in the output voltage ramp and the maximum total output capacitance listed in electrical characteristics must not be exceeded. At shutdown the output voltage is discharged to 0.6 V level using forced-PWM operation. This can increase the input voltage if the load current is small and the output capacitor is large. Below 0.6 V level the output capacitor is discharged by the internal discharge resistor and with large capacitor more time is required to settle V_{OUT} down as a consequence of the increased time constant.

Table 13. Recommended Output Capacitors (X7R or X7T Dielectric)

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L x W x H (mm)	VOLTAGE RATING (V)
Murata	GCM31CR71A226KE02	22 μ F (10%)	1206	3.2 x 1.6 x 1.6	10

8.2.1.4 Snubber Components

If the input voltage for the regulators is above 4 V, snubber components are needed at the switching nodes to decrease voltage spiking in the switching node and to improve EMI. The snubber capacitors C_0 , C_1 , C_2 , and C_3 and the snubber resistors R_0 , R_1 , R_2 , and R_3 are shown in [Figure 21](#). The recommended components are shown in [Table 14](#) and these component values give good performance on LP875701-Q1 EVM. The optimal resistance and capacitance values finally depend on the PCB layout.

Table 14. Recommended Snubber Components

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L x W x H (mm)	VOLTAGE / POWER RATING
Vishay-Dale	CRCW04023R90JNED	3.9 Ω (5%)	0402	1 x 0.5 x 0.4	62 mW
Murata	GCM1555C1H391JA16	390 pF (5%)	0402	1 x 0.5 x 0.5	50 V

8.2.1.5 Supply Filtering Components

The VANA input is used to supply analog and digital circuits in the device. See [Table 15](#) for recommended components for VANA input supply filtering.

Table 15. Recommended Supply Filtering Components

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L x W x H (mm)	VOLTAGE RATING (V)
Murata	GCM155R71C104KA55	100 nF (10%)	0402	1.0 x 0.5 x 0.5	16
Murata	GCM188R71C104KA37	100 nF (10%)	0603	1.6 x 0.8 x 0.8	16

8.2.2 Detailed Design Procedure

The performance of the LP875701-Q1 device depends greatly on the care taken in designing the printed circuit board (PCB). The use of low-inductance and low serial-resistance ceramic capacitors is strongly recommended, while correct grounding is crucial. Attention must be given to decoupling the power supplies. Decoupling capacitors must be connected close to the device and between the power and ground pins to support high peak currents being drawn from system power rail during turnon of the switching MOSFETs. Keep input and output traces as short as possible, because trace inductance, resistance, and capacitance can easily become the performance limiting items. The separate power pins VIN_Bx are not connected together internally. Connect the VIN_Bx power connections together outside the package using power plane construction.

8.2.3 Application Curves

$V_{OUT} = 1.0$ Volt

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 2.8 V and 5.5 V. This input supply must be well regulated and can withstand maximum input current and keep a stable voltage without voltage drop even at load transition condition. The resistance of the input supply rail must be low enough that the input current transient does not cause too high drop in the LP875701-Q1 supply voltage that can cause false UVLO fault triggering. If the input supply is located more than a few inches from the LP875701-Q1 additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

10 Layout

10.1 Layout Guidelines

The high frequency and large switching currents of the LP875701-Q1 make the choice of layout important. Good power supply results only occur when care is given to correct design and layout. Layout affects noise pickup and generation and can cause a good design to perform with less-than-expected results. With a range of output currents from milliamps to 10 A and over, good power supply layout is much more difficult than most general PCB design. Use the following steps as a reference to make sure the device is stable and keeps correct voltage and current regulation across its intended operating voltage and current range.

- Place C_{IN} as close as possible to the VIN_Bx pin and the PGND_Bxx pin. Route the V_{IN} trace wide and thick to avoid IR drops. The trace between the positive node of the input capacitor and the VIN_Bx pin(s) of LP875701-Q1, as well as the trace between the negative node of the input capacitor and power PGND_Bxx pin(s), must be kept as short as possible. The input capacitance provides a low-impedance voltage source for the switching converter. The inductance of the connection is the most important parameter of a local decoupling capacitor — parasitic inductance on these traces must be kept as small as possible for correct device operation. The parasitic inductance can be decreased by using a ground plane as close as possible to top layer by using thin dielectric layer between top layer and ground plane.
- The output filter, consisting of COUT and L, converts the switching signal at SW_Bx to the noiseless output voltage. It must be placed as close as possible to the device keeping the switch node small, for best EMI behavior. Route the traces between the LP875701-Q1 output capacitors and the load direct and wide to avoid losses due to the IR drop.
- Input for analog blocks (VANA and AGND) must be isolated from noisy signals. Connect VANA directly to a quiet system voltage node and AGND to a quiet ground point where no IR drop occurs. Place the decoupling capacitor as close as possible to the VANA pin.
- If the processor load supports remote voltage sensing, connect the feedback pins FB_Bx of the LP875701-Q1 device to the respective sense pins on the processor. The sense lines are susceptible to noise. They must be kept away from noisy signals such as PGND_Bxx, VIN_Bx, and SW_Bx, as well as high bandwidth signals such as the I²C. Avoid both capacitive and inductive coupling by keeping the sense lines short, direct, and close to each other. Run the lines in a quiet layer. Isolate them from noisy signals by a voltage or ground plane if possible. Running the signal as a differential pair is recommended for multiphase outputs. If series resistors are used for load current measurement, place them after connection of the voltage feedback. Connect feedback pin FB_B0 to supply terminal of the point-of-load, and feedback pin FB_B1 to the GND of the point-of-load.
- PGND_Bxx, VIN_Bx and SW_Bx must be routed on thick layers. They must not surround inner signal layers, which are cannot withstand interference from noisy PGND_Bxx, VIN_Bx and SW_Bx.
- If the input voltage is above 4 V, place snubber components (capacitor and resistor) between SW_Bx and ground on all four phases. The components can be also placed to the other side of the board if there are area limitations and the routing traces can be kept short.

Due to the small package of this converter and the overall small solution size, the thermal performance of the PCB layout is important. Many system-dependent parameters such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component. Correct PCB layout, focusing on thermal performance, results in lower die temperatures. Wide and thick power traces can sink dissipated heat. This can be improved further on multi-layer PCB designs with vias to different planes. This results in decreased junction-to-ambient ($R_{\theta JA}$) and junction-to-board ($R_{\theta JB}$) thermal resistances and thereby decreases the device junction temperature, T_J . TI strongly recommends doing a careful system-level 2D or full 3D dynamic thermal analysis at the beginning product design process, by using a thermal modeling analysis software.

10.2 Layout Example

Below example is an illustrative example only. For an exact PCB layout example, please refer to the EVM Manual

(1) The output voltage rails are shorted together based on the configuration as shown in [Typical Application](#).

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Community Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OUTLINE

RNF0026C

VQFN-HR - 0.9 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

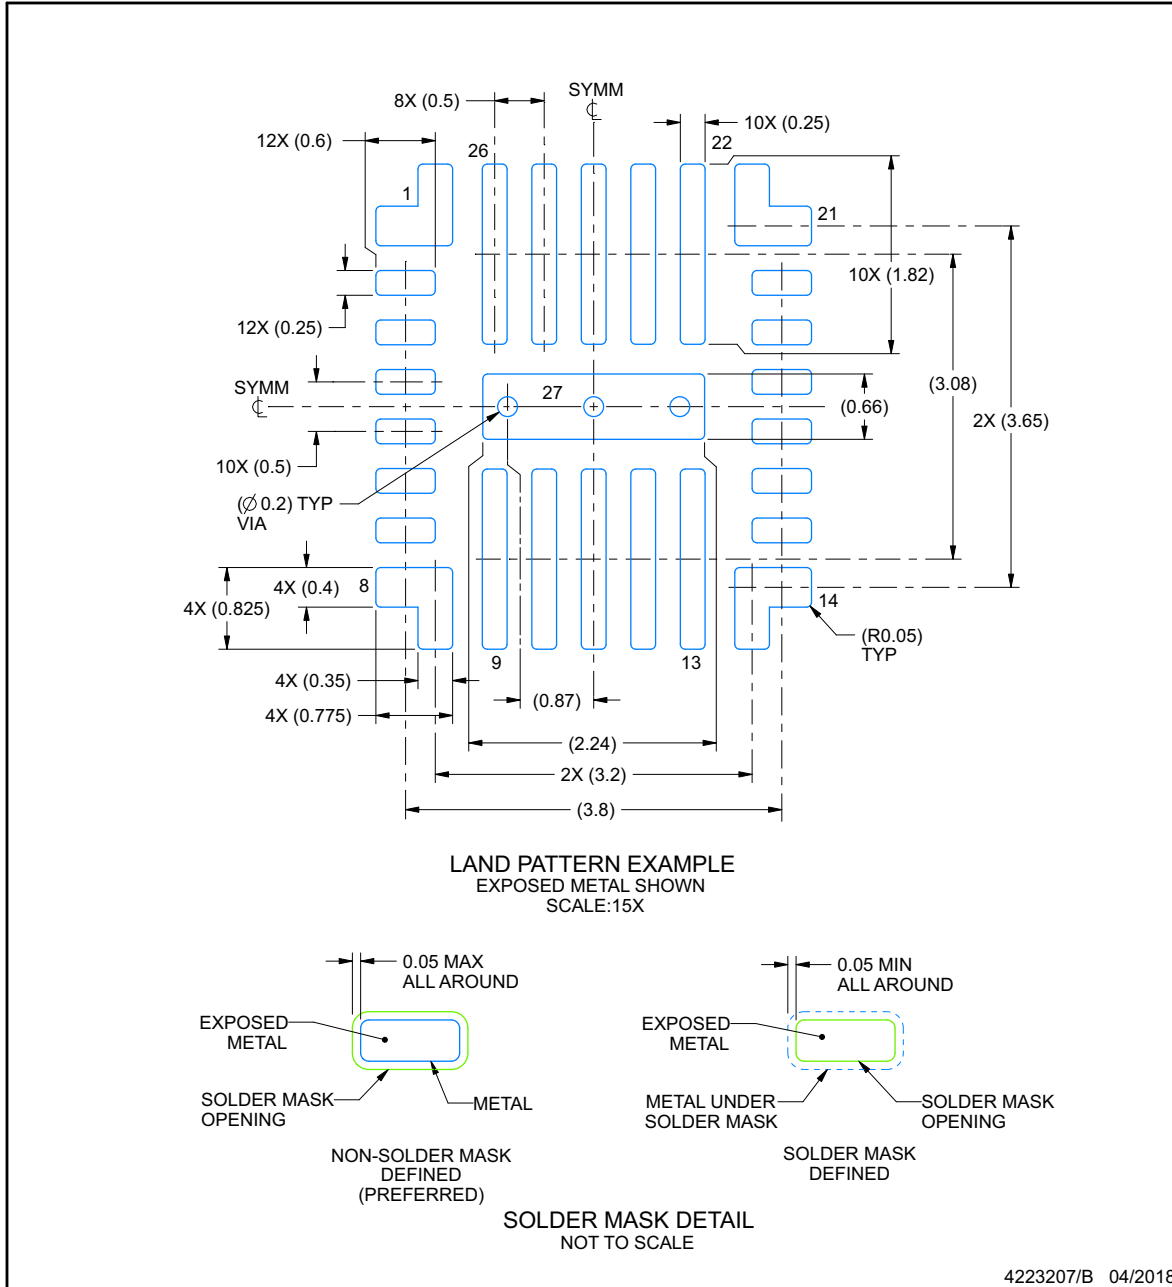

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RNF0026C

VQFN-HR - 0.9 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

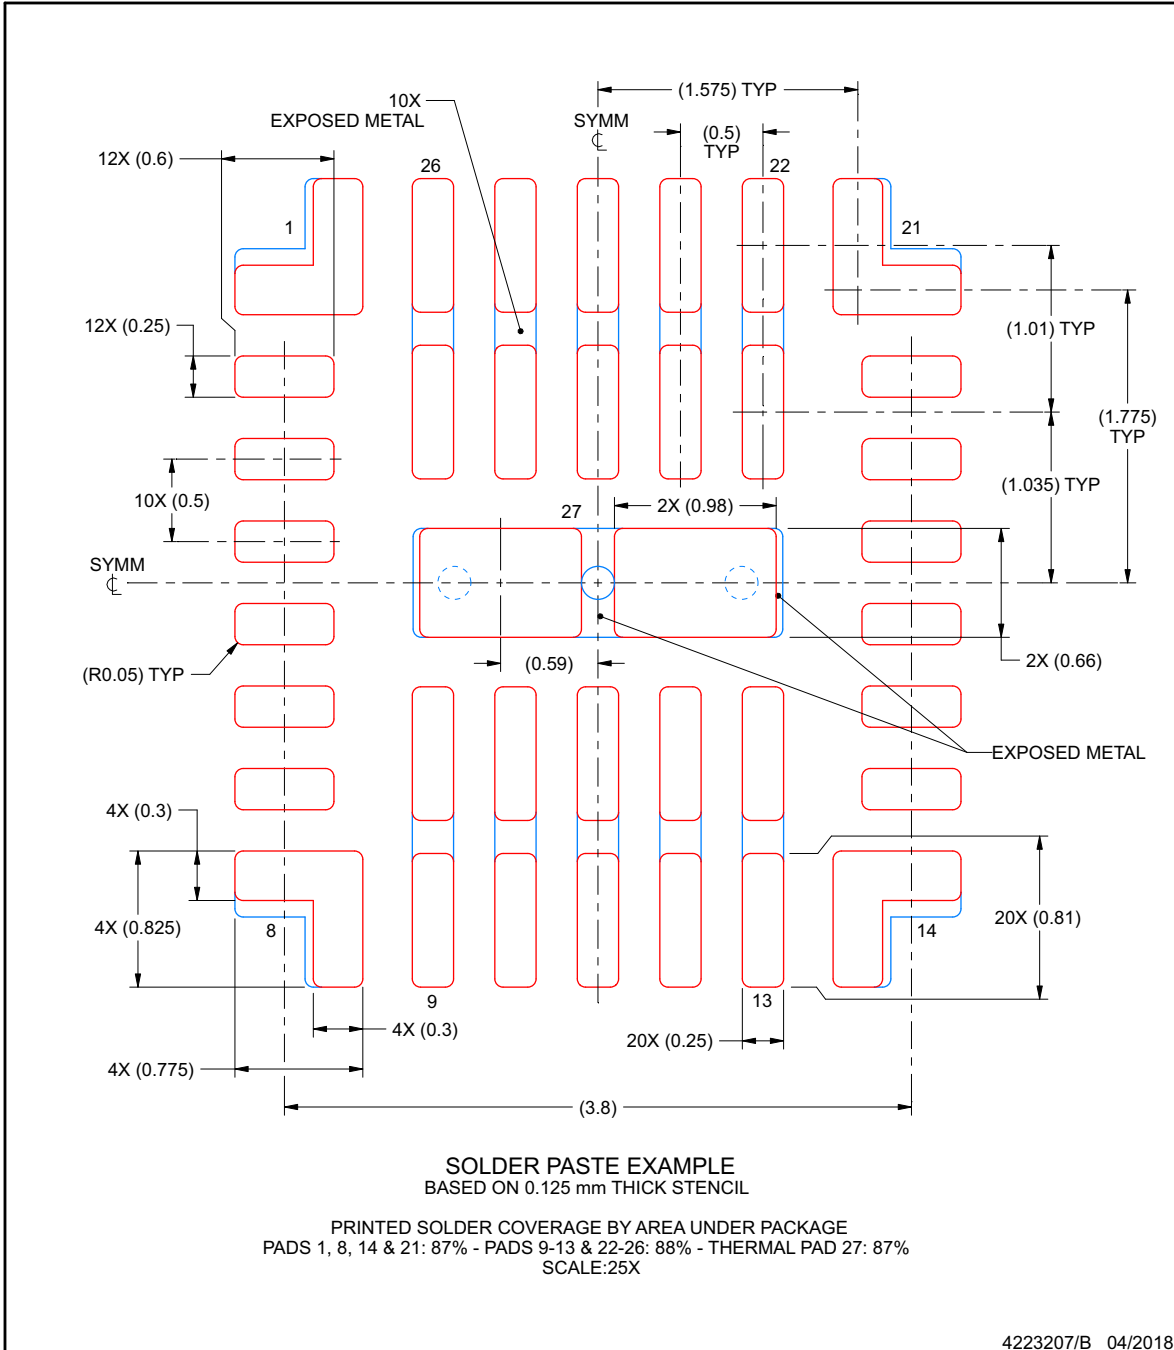

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RNF0026C

VQFN-HR - 0.9 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. For alternate stencil design recommendations, see IPC-7525 or board assembly site preference.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP875701ARNFRQ1	ACTIVE	VQFN-HR	RNF	26	3000	Green (RoHS & no Sb/Br)	SN	Level-1-260C-UNLIM	-40 to 125	LP8757 01A-Q1	Samples
LP875701ARNFTQ1	ACTIVE	VQFN-HR	RNF	26	250	Green (RoHS & no Sb/Br)	SN	Level-1-260C-UNLIM	-40 to 125	LP8757 01A-Q1	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
