

STEREO AUDIO DAC WITH USB INTERFACE, SINGLE-ENDED HEADPHONE OUTPUT AND S/PDIF OUTPUT

FEATURES

- On-Chip USB Interface:
 - No Need of Dedicated Device Driver
 - With Full-Speed Transceivers
 - Fully Compliant With USB 1.1 Specification
 - Certified by USB-IF
 - Partially Programmable Descriptors
 - Adaptive Isochronous Transfer for Playback
 - Bus-Powered or Self-Powered Operation
- Sampling Rate: 32, 44.1, 48 kHz
- On-Chip Clock Generator With Single 12-MHz Clock Source
- Single Power Supply:
 - Bus-Powered: 5 V, Typical (V_{BUS})
 - Self-Powered: 3.3 V, Typical
- 16-Bit Delta-Sigma Stereo DAC
 - Analog Performance at 5 V (Bus-Powered), 3.3 V (Self-Powered):
 - THD+N: 0.006% $R_L > 10\text{ k}\Omega$, Self-Powered
 - THD+N: 0.025% $R_L = 32\text{ }\Omega$
 - SNR = 98 dB
 - Dynamic Range: 98 dB
 - $P_O = 12\text{ mW}$, $R_L = 32\text{ }\Omega$
 - Oversampling Digital Filter
 - Pass-Band Ripple = $\pm 0.04\text{ dB}$
 - Stop-Band Attenuation = -50 dB
 - Single-Ended Voltage Output
 - Analog LPF Included
- Multiple Functions:
 - Up to Eight Human Interface Device (HID) Interfaces (Depending on Model and Settings)
 - Suspend Flag
 - S/PDIF Out With SCMS

- External ROM Interface (PCM2704/6)
- Serial Programming Interface (PCM2705/7)
- I²S Interface (Selectable on PCM2706/7)
- Package:
 - 28-Pin SSOP (PCM2704/5)
 - 32-Pin TQFP (PCM2706/7)

APPLICATIONS

- USB Headphones
- USB Audio Speaker
- USB CRT/LCD Monitor
- USB Audio Interface Box
- USB-Featured Consumer Audio Product

DESCRIPTION

The PCM2704/5/6/7 is TI's single-chip USB stereo audio DAC with USB-compliant full-speed protocol controller and S/PDIF. The USB-protocol controller works with no software code, but USB descriptors can be modified in some parts (for example, vendor ID/product ID) through the use of an external ROM (PCM2704/6), SPI (PCM2705/7), or on request. ⁽¹⁾ The PCM2704/5/6/7 employs SpAct™ architecture, TI's unique system that recovers the audio clock from USB packet data. On-chip analog PLLs with SpAct enable playback with low clock jitter.

(1) The modification of the USB descriptor through external ROM or SPI must comply with USB-IF guidelines, and the vendor ID must be your own ID as assigned by the USB-IF. The descriptor also can be modified by changing a mask; contact your representative for details.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SpAct is a trademark of Texas Instruments.
System Two, Audio Precision are trademarks of Audio Precision, Inc.
I2S is a trademark of NXP Semiconductors.
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted ⁽¹⁾

Supply voltage	V _{BUS}	–0.3 V to 6.5 V
	V _{CCP} , V _{CCL} , V _{CCR} , V _{DD}	–0.3 V to 4 V
Supply voltage differences	V _{CCP} , V _{CCL} , V _{CCR} , V _{DD}	±0.1 V
Ground voltage differences	PGND, AGNDL, AGNDR, DGND, ZGND	±0.1 V
Digital input voltage	HOST	–0.3 V to 6.5 V
	D+, D–, HID0/MS, HID1/MC, HID2/MD, XTI, XTO, DOUT, $\overline{\text{SSPND}}$, CK, DT, PSEL, FSEL, TEST, TEST0, TEST1, FUNC0, FUNC1, FUNC2, FUNC3	–0.3 V to (V _{DD} + 0.3) V < 4 V
Analog input voltage	V _{COM}	–0.3 V to (V _{CCP} + 0.3) V < 4 V
	V _{OUTR}	–0.3 V to (V _{CCR} + 0.3) V < 4 V
	V _{OUTL}	–0.3 V to (V _{CCL} + 0.3) V < 4 V
Input current (any pins except supplies)		±10 mA
Ambient temperature under bias		–40°C to 125°C
Storage temperature		–55°C to 150°C
Junction temperature		150°C
Lead temperature (soldering)		260°C, 5 s
Package temperature (IR reflow, peak)		260°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range

		MIN	NOM	MAX	UNIT
Supply voltage	V _{BUS}	4.35	5	5.25	V

DETAILED DESCRIPTION

Clock and Reset

For both USB and audio functions, the PCM2704/5/6/7 requires a 12-MHz (± 500 ppm) clock, which can be generated by the built-in oscillator using a 12-MHz crystal resonator. The 12-MHz crystal resonator must be connected to XTI (pin 28 for PCM2704/5, pin 12 for PCM2706/7) and XTO (pin 1 for PCM2704/5, pin 13 for PCM2706/7) with one large (1-M Ω) resistor and two small capacitors, the capacitance of which depends on the specified load capacitance of the crystal resonator. An external clock can be supplied from XTI (pin 28 for PCM2704/5, pin 12 for PCM2706/7). If an external clock is supplied, XTO (pin 1 for PCM2704/5, pin 13 for PCM2706/7) must be left open. Because no clock disabling pin is provided, it is not recommended to use the external clock supply. $\overline{\text{SSPND}}$ (pin 27 for PCM2704/5, pin 11 for PCM2706/7) is unable to use clock disabling.

The PCM2704/5/6/7 has an internal power-on reset circuit, and it works automatically when V_{DD} (pin 7 for PCM2704/5, pin 21 for PCM2706/7) exceeds 2 V typical (1.6 V–2.4 V), which is equivalent to V_{BUS} (pin 10 for PCM2704/5, pin 24 for PCM2706/7) exceeding 3 V typical for bus-powered applications. Approximately 700 μs is required until internal reset release.

Operation Mode Selection

The PCM2704/5/6/7 has the following mode-select pins.

Power Configuration Select/Host Detection

PSEL (pin 4 for PCM2704/5, pin 16 for PCM2706/7) is dedicated to selecting the power source. This selection affects the configuration descriptor. While in bus-powered operation, maximum power consumption from V_{BUS} is determined by HOST (pin 21 for PCM2704/5, pin 3 for PCM2706/7). For self-powered operation, HOST must be connected to V_{BUS} of the USB bus with a pulldown resistor to detect attach and detach. (To avoid excessive suspend current, the pulldown should be a high-value resistor.)

Table 1. Power Configuration Select

PSEL	DESCRIPTION
0	Self-powered
1	Bus-powered
HOST	DESCRIPTION
0	Detached from USB (self-powered)/100 mA (bus-powered)
1	Attached to USB (self-powered)/500 mA (bus-powered)

Function Select (PCM2706/7)

FSEL (pin 9) determines the function of FUNC0–FUNC3 (pins 4, 5, 18, and 19) and DOUT (pin17). When the I²S interface is required, FSEL must be set to LOW. Otherwise, FSEL must be set to HIGH.

Table 2. Function Select

FSEL	DOUT	FUNC0	FUNC1	FUNC2	FUNC3
0	Data out (I ² S)	LRCK (I ² S)	BCK (I ² S)	SYSCK (I ² S)	Data in (I ² S)
1	S/PDIF data	Next track (HID) ⁽¹⁾	Previous track (HID) ⁽¹⁾	Stop (HID) ⁽¹⁾	Play/pause (HID) ⁽¹⁾

(1) Valid on the PCM2706; no function assigned on the PCM2707.

USB Interface

Control data and audio data are transferred to the PCM2704/5/6/7 via D+ (pin 9 for PCM2704/5, pin 23 for PCM2706/7) and D– (pin 8 for PCM2704/5, pin 22 for PCM2706/7). D+ should be pulled up with a 1.5-k Ω ($\pm 5\%$) resistor. To avoid back voltage in self-powered operation, the device must not provide power to the pullup resistor on D+ while V_{BUS} of the USB port is inactive.

All data to/from the PCM2704/5/6/7 are transferred at full speed. The following information is provided in the device descriptor. Some parts of the device descriptor can be modified through external ROM (PCM2704/6), SPI (PCM2705/7), or internal mask ROM on request.

Table 3. Device Descriptor

DEVICE DESCRIPTOR	DESCRIPTION
USB revision	1.1 compliant
Device class	0x00 (device defined interface level)
Device subclass	0x00 (not specified)
Device protocol	0x00 (not specified)
Max packet size for endpoint 0	8 bytes
Vendor ID	0x08BB (default value, can be modified)
Product ID	0x2704/0x2705/0x2706/0x2707 (These values correspond to the model number, and the value can be modified.)
Device release number	1.0 (0x0100)
Number of configurations	1
Vendor strings	Burr-Brown from TI (default value, can be modified)
Product strings	USB Audio DAC (default value, can be modified)
Serial number	Not supported

The following information is contained in the configuration descriptor. Some parts of the configuration descriptor can be modified through external ROM (PCM2704/6), SPI (PCM2705/7), or internal mask ROM on request.

Table 4. Configuration Descriptor

CONFIGURATION DESCRIPTOR	DESCRIPTION
Interface	Three interfaces
Power attribute	0x80 or 0xC0 (bus-powered or self-powered, depending on PSEL; no remote wake up. This value can be modified.)
Max power	0x0A, 0x32 or 0xFA (20 mA for self-powered, 100 mA or 500 mA for bus-powered, depending on PSEL and HOST. This value can be modified.)

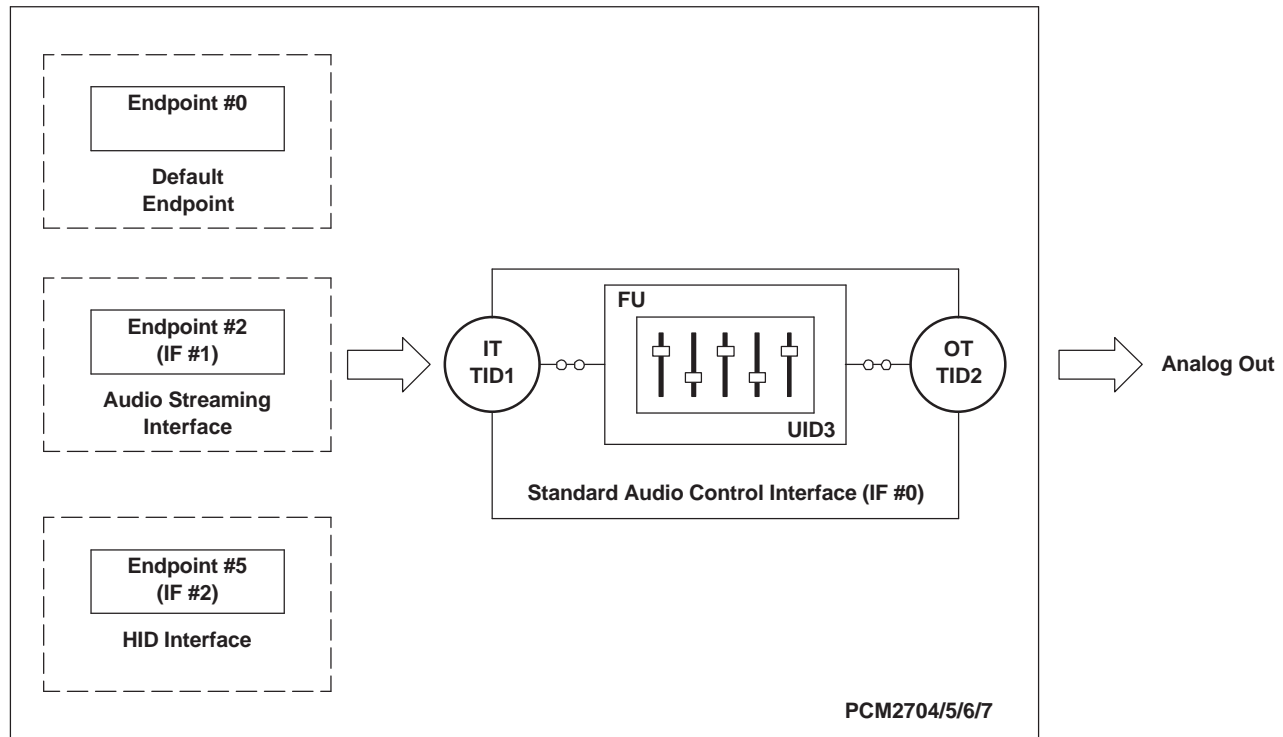

The following information is contained in the string descriptor. Some parts of the string descriptor can be modified through external ROM (PCM2704/6), SPI (PCM2705/7), or internal mask ROM on request.

Table 5. String Descriptor

STRING DESCRIPTOR	DESCRIPTION
#0	0x0409
#1	Burr-Brown from TI (default value, can be modified)
#2	USB Audio DAC (default value, can be modified)

Device Configuration

Figure 21 illustrates the USB audio function topology. The PCM2704/5/6/7 has three interfaces. Each interface is enabled by some alternative settings.

M0024-01

Figure 21. USB Audio Function Topology

Interface #0 (Default/Control Interface)

Interface #0 is the control interface. Setting #0 is the only possible setting for interface #0. Setting #0 describes the standard audio control interface. Audio control interface consists of a terminal. The PCM2704/5/6/7 has three terminals:

- Input terminal (IT #1) for isochronous-out stream
- Output terminal (OT #2) for audio analog output
- Feature unit (FU #3) for DAC digital attenuator

Input terminal #1 is defined as a USB stream (terminal type 0x0101). Input terminal #1 can accept two-channel audio streams constructed of left and right channels. Output terminal #2 is defined as a speaker (terminal type 0x0301). Feature unit #3 supports the following sound control features:

- Volume control
- Mute control

The built-in digital volume controller can be manipulated by an audio-class-specific request from 0 dB to –64 dB in steps of 1 dB. Changes are made by incrementing or decrementing one step (1 dB) for every $1/f_s$ time interval, until the volume level reaches the requested value. Each channel can be set to a separate value. The master volume control is not supported. A request to the master volume is stalled and ignored. The built-in digital mute controller can be manipulated by an audio-class-specific request. A master mute control request is acceptable. A mute control request to an individual channel is stalled and ignored. The digital volume control does not affect the S/PDIF and I²S outputs (PCM2706/7).

Interface #1 (Isochronous-Out Interface)

Interface #1 is for the audio-streaming data-out interface. Interface #1 has the following three alternative settings. Alternative setting #0 is the zero-bandwidth setting. All other alternative settings are operational settings.

ALTERNATIVE SETTING	DATA FORMAT			TRANSFER MODE	SAMPLING RATE (kHz)
00	Zero bandwidth				
01	16-bit	Stereo	2s complement (PCM)	Adaptive	32, 44.1, 48
02	16-bit	Mono	2s complement (PCM)	Adaptive	32, 44.1, 48

Interface #2 (HID Interface)

Interface #2 is the interrupt-data-in interface. Interface #2 comprises the HID consumer control device. Alternative setting #0 is the only possible setting for interface #2.

On the HID device descriptor, eight HID items are reported as follows for any model, in any configuration.

Basic HID Operation

Interface #2 can report the following three key statuses for any model. These statuses can be set by the HID0–HID2 pins (PCM2704/6) or the SPI port (PCM2705/7).

- Mute (0xE2)
- Volume up (0xE9)
- Volume down (0xEA)

Extended HID Operation (PCM2705/6/7)

By using the FUNC0–FUNC3 pins (PCM2706) or the SPI port (PCM2705/7), the following additional conditions can be reported to the host.

- Play/Pause (0xCD)
- Stop (0xB7)
- Previous (0xB6)
- Next (0xB5)

Auxiliary HID Status Report (PCM2705/7)

One additional HID status can be reported to the host though the SPI port. This status flag is defined by SPI command or external ROM. This definition must be described as on the report descriptor with a three-byte usage ID. *AL A/V Capture* (0x0193) is assigned as the default for this status flag.

Endpoints

The PCM2704/5/6/7 has three endpoints:

- Control endpoint (EP #0)
- Isochronous-out audio data-stream endpoint (EP #2)
- HID endpoint (EP #5)

The control endpoint is a default endpoint. The control endpoint is used to control all functions of the PCM2704/5/6/7 by standard USB request and USB audio-class-specific request from the host. The isochronous-out audio data-stream endpoint is an audio sink endpoint that receives the PCM audio data. The isochronous-out audio data-stream endpoint accepts the adaptive transfer mode. The HID endpoint is an interrupt-in endpoint. The HID endpoint reports HID status every 10 ms.

The HID endpoint is defined as a consumer-control device. The HID function is designed as an independent endpoint from the isochronous-out endpoint. This means that the effect of HID operation depends on host software. Typically, the HID function is used to control the primary audio-out device.

DAC

The PCM2704/5/6/7 has a DAC that uses an oversampling technique with $128\text{-}f_s$ second-order multibit noise shaping. This technique provides extremely low quantization noise in the audio band, and the built-in analog low-pass filter removes the high-frequency components of the noise-shaping signal. DAC outputs through the headphone amplifier V_{OUTL} and V_{OUTR} can provide 12 mW at $32\ \Omega$, as well as $1.8\ V_{PP}$ into a 10-k Ω load.

Digital Audio Interface—S/PDIF Output

The PCM2704/5/6/7 employs S/PDIF output. Isochronous-out data from the host are encoded to S/PDIF output DOUT, as well as to DAC analog outputs V_{OUTL} and V_{OUTR} . Interface format and timing follow the IEC-60958 standard. Monaural data are converted to the stereo format at the same data rate. S/PDIF output is not supported in the I²S I/F enable mode. The implementation of this feature is optional. Note that it is your responsibility to determine whether to implement this feature in your product or not.

Channel Status Information

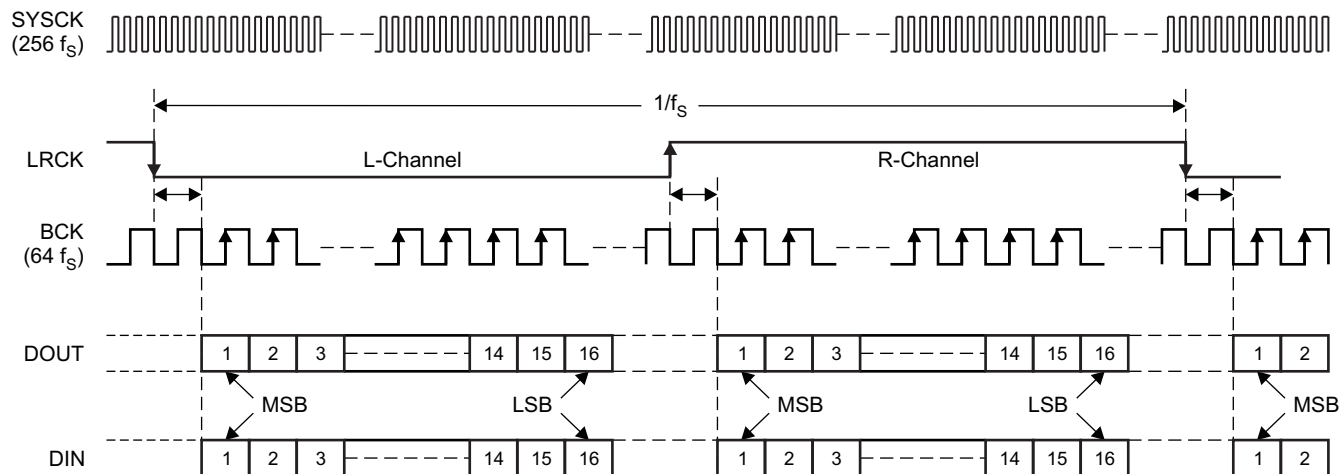

The channel status information is fixed as consumer application, PCM mode, copyright, and digital/digital converter. All other bits are fixed as 0s, except for the sample frequency, which is set automatically according to the data received through the USB.

Copyright Management

Digital audio data output always is encoded as original with SCMS control. Only one generation of digital duplication is allowed.

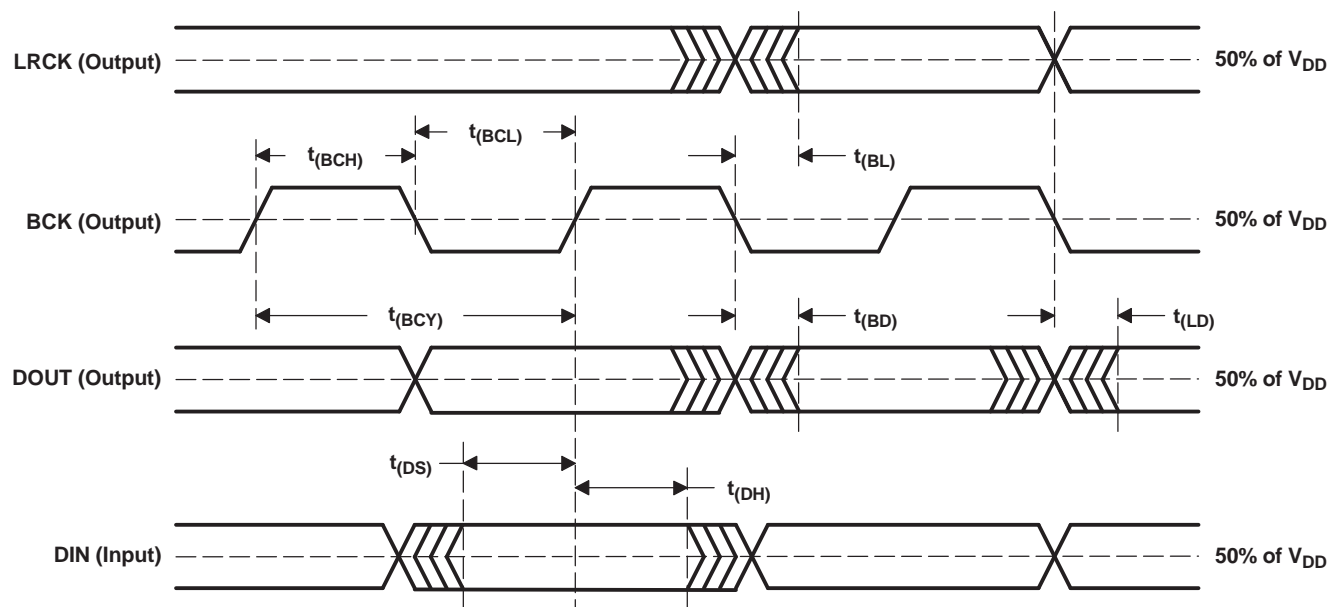

Digital Audio Interface—I²S Interface Output (PCM2706/7)

The PCM2706 and PCM2707 can support the I²S interface, which is enabled by FSEL (pin 9). In the I²S interface enabled mode, pins 4, 18, 19, 5, and 17 are assigned as DIN, SYSCK, BCK, LRCK, and DOUT, respectively. They provide digital output/input data in the 16-bit I²S format, which also is accepted by the internal DAC. I²S interface format and timing are shown in Figure 22, Figure 23, and Figure 24.

Figure 24. Audio Clock Timing

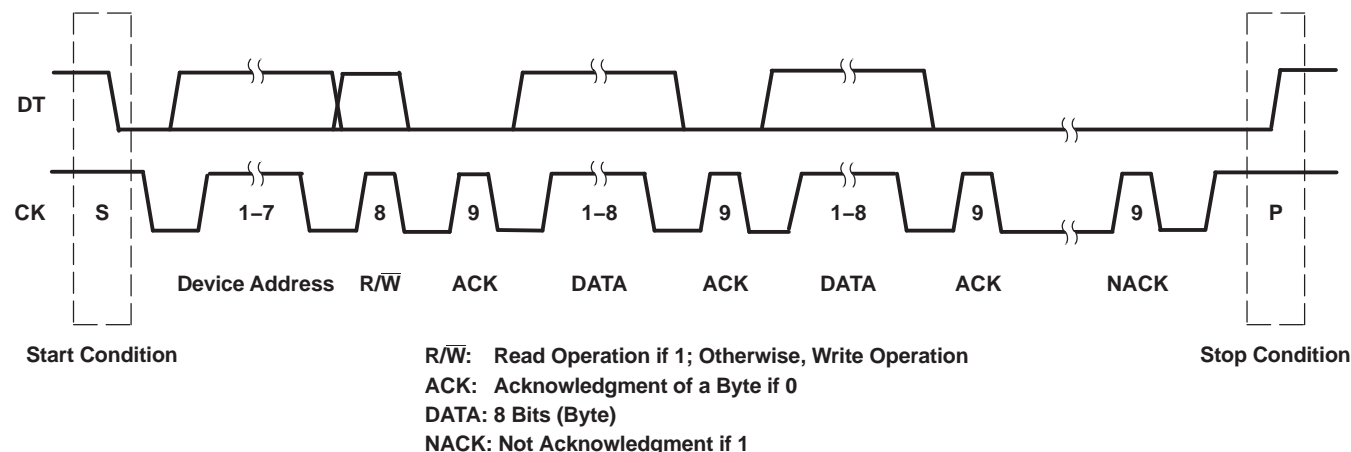

DESCRIPTOR DATA MODIFICATION

The descriptor data can be modified through I²C port by external ROM (PCM2704/6) or through our SPI port by an SPI host such as an MCU (PCM2705/7) under a particular condition of PSEL pin and HOST pin. A condition of PSEL pin = High and HOST pin = High is needed to modify the descriptor data, and D+ pull-up must not be activated before completion of programming the descriptor data through external ROM or SPI port. The descriptor data have to be sent from external ROM to PCM2704/6 or from SPI host to PCM2705/7 in LSB first with specified byte order. Also, the content of the power attribute and max power must be consistent with PSEL setting and power usage from USB VBUS of actual application. Therefore, the descriptor data modification in self-powered configuration (PSEL = Low) is not supported.

External ROM Descriptor (PCM2704/6)

The PCM2704/6 supports an external ROM interface to override internal descriptors. Pin 3 (for PCM2704)/pin 15 (for PCM2706) is assigned as DT (serial data) and pin 2 (for PCM2704)/pin 14 (for PCM2706) is assigned as CK (serial clock) of the I²C interface when using the external ROM descriptor. Descriptor data is transferred from the external ROM to the PCM2704/6 through the I²C interface the first time when the device activates after power-on reset. Before completing a read of the external ROM, the PCM2704/6 replies with NACK for any USB command request from the host to the device itself. The descriptor data, which can be in external ROM, are as follows. String descriptors must be described in ANSI ASCII code (1 byte for each character). String descriptors are converted automatically to unicode strings for transmission to the host. The device address of the external ROM is fixed as 0xA0. The data must be stored from address 0x00 and must consist of 57 bytes, as described in the following items. The data bits must be sent from LSB to MSB on the I²C bus. This means that each byte of data must be stored with its bits in reverse order. Read operation is performed at a frequency of XT1/384 (approximately 30 kHz). The content of power attribute and max power must be consistent with actual application circuit configuration (PSEL setting and actual power usage from VBUS of USB connector); otherwise, it may cause improper or unexpected PCM2704/6 operation.

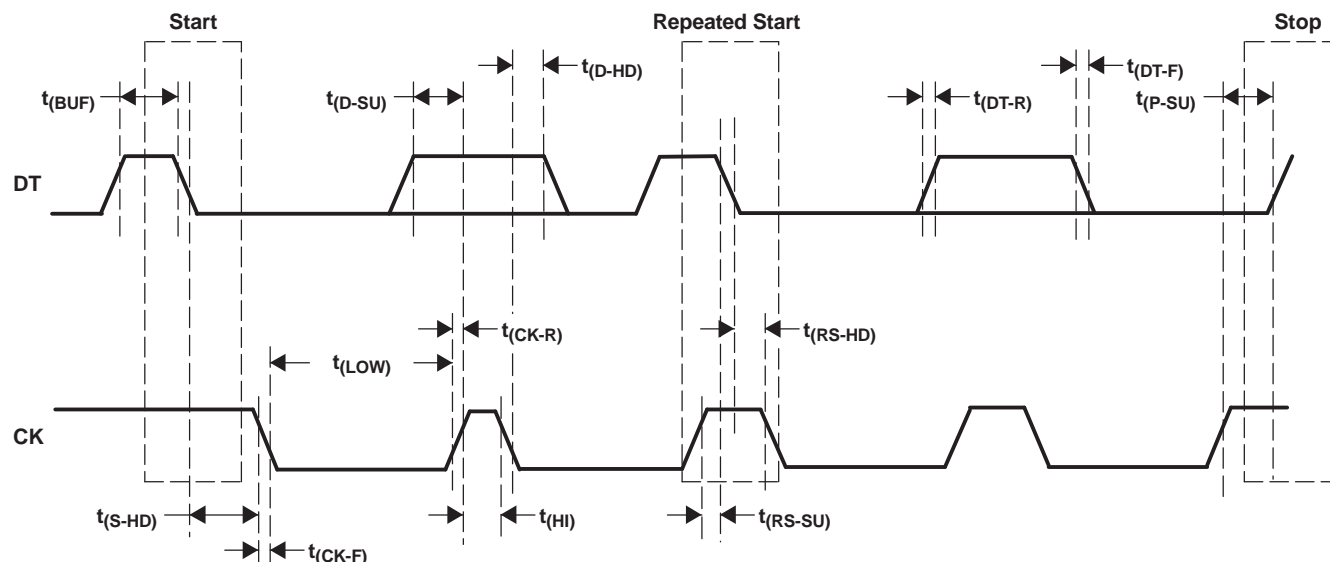

- Vendor ID (2 bytes)
- Product ID (2 bytes)
- Product string (16 bytes in ANSI ASCII code)
- Vendor string (32 bytes in ANSI ASCII code)
- Power attribute (1 byte)
- Max power (1 byte)
- Auxiliary HID usage ID in report descriptor (3 bytes)

External ROM Example

Here is an example of external ROM data, with an explanation of the example following the data.

```
0xBB, 0x08, 0x04, 0x27,  
0x50, 0x72, 0x6F, 0x64, 0x75, 0x63, 0x74, 0x20, 0x73, 0x74, 0x72, 0x69, 0x6E, 0x67, 0x73, 0x2E,  
0x56, 0x65, 0x6E, 0x64, 0x6F, 0x72, 0x20, 0x73, 0x74, 0x72, 0x69, 0x6E, 0x67, 0x73, 0x20, 0x61,  
0x72, 0x65, 0x20, 0x70, 0x6C, 0x61, 0x63, 0x65, 0x64, 0x20, 0x68, 0x65, 0x72, 0x65, 0x2E, 0x20,  
0x80,  
0x7D,  
0x0A, 0x93, 0x01
```

The data are stored beginning at address 0x00.

Vendor ID: 0x08BB

Product ID: 0x2704

Product string: Product strings (16 bytes).

Vendor string: Vendor strings are placed here (32 bytes, 31 visible characters are followed by 1 space).

Power attribute (bmAttribute): 0x80 (Bus-powered).

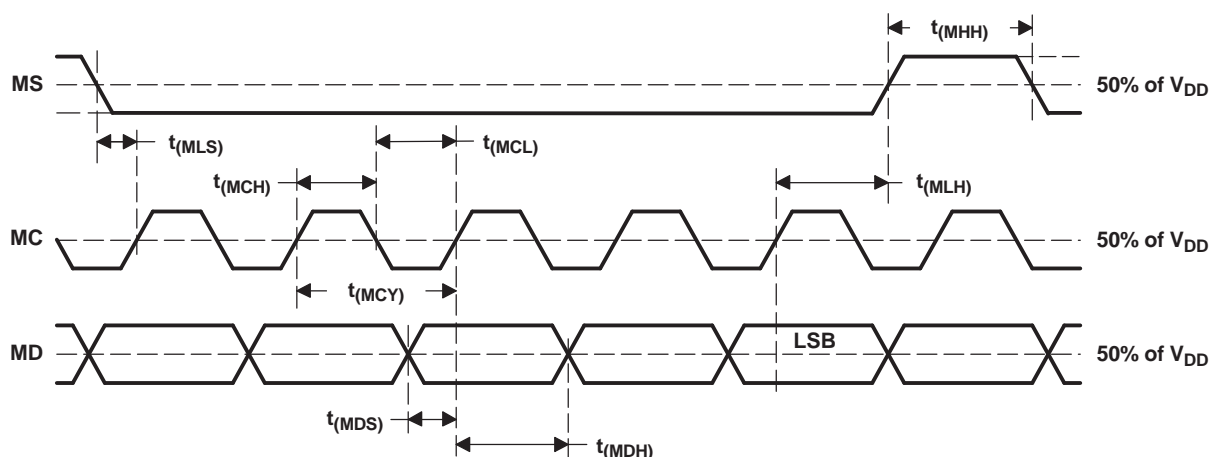

Max power (maxPower): 0x7D (250 mA).

Auxiliary HID usage ID: 0x0A, 0x93, 0x01 (AL A/V capture).

Note that the data bits must be sent from LSB to MSB on the I²C bus. This means that each data byte must be stored with its bits in reverse order.

Serial Programming Interface (PCM2705/7)

The PCM2705/7 supports the serial programming interface (SPI) to program the descriptor and to set the HID state. Descriptor data are described in the [SubSec 1 8.8 External ROM Descriptor](#) section.

T0012-02

Figure 28. SPI Write Operation

SPI Register (PCM2705/7)

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
0	0	0	0	ST	0	ADDR	0	D0	D1	D2	D3	D4	D5	D6	D7

D[7:0] **Function of the lower 8 bits depends on the value of the ST (B11) bit.**

ST = 0 (HID status write)

- D7 Reports MUTE HID status to the host (active high)
- D6 Reports volume-up HID status to the host (active high)
- D5 Reports volume-down HID status to the host (active high)
- D4 Reports next-track HID status to the host (active high)
- D3 Reports previous-track HID status to the host (active high)
- D2 Reports stop HID status to the host (active high)
- D1 Reports play/pause HID status to the host (active high)
- D0 Reports extended command status to the host (active high)

ST = 1 (ROM data write)

D[7:0] Internal descriptor ROM data, D0:LSB, D7:MSB

The content of power attribute and max power must be consistent with the actual application circuit configuration (PSEL setting and actual power usage from VBUS of USB connector); otherwise, it may cause improper or unexpected PCM2705/7 operation.

ADDR **Starts write operation for internal descriptor reprogramming (active high)**

This bit resets descriptor ROM address counter and indicates following words should be ROM data (described in the *External ROM Example* section). 456 bits of ROM data must be continuously followed after this bit has been asserted. The data bits must be sent from LSB (D0) to MSB (D7).

To set ADDR high, ST must be set low. Note that the lower 8 bits are still active as an HID status write when ST is set low.

ST **Determines the function of the lower 8-bit data as follows:**

- 0: HID status write
- 1: Descriptor ROM data write

Table 6. Functionality of ST and ADDR Bit Combinations

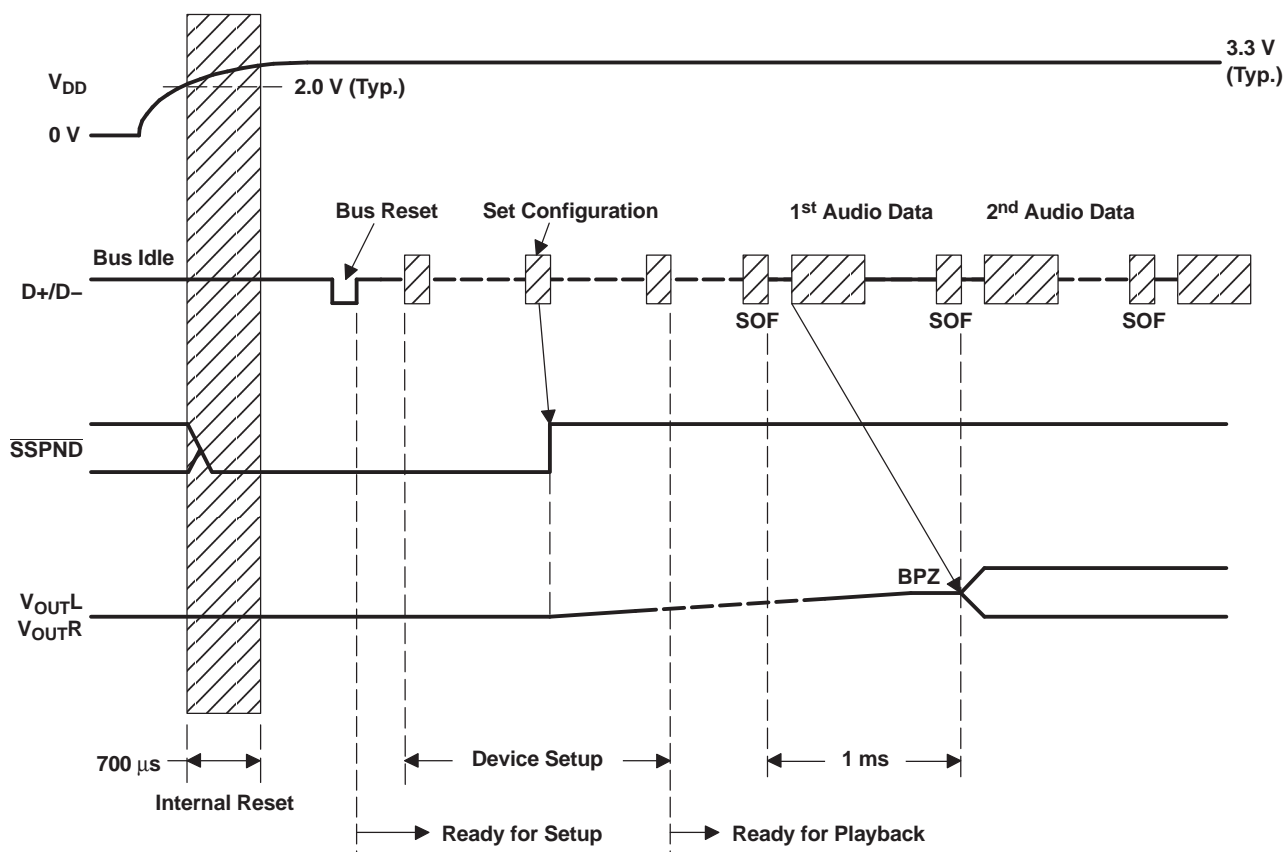

ST	ADDR	FUNCTION
0	0	HID status write
0	1	HID status write and descriptor ROM address reset
1	0	Descriptor ROM data write
1	1	Reserved

USB Host Interface Sequence

Power-On, Attach, and Playback Sequence

The PCM2704/5/6/7 is ready for setup when the reset sequence has finished and the USB bus is attached. After a connection has been established by setup, the PCM2704/5/6/7 is ready to accept USB audio data. While waiting for the audio data (idle state), the analog output is set to bipolar zero (BPZ).

When receiving the audio data, the PCM2704/5/6/7 stores the first audio packet, which contains 1 ms of audio data, into the internal storage buffer. The PCM2704/5/6/7 starts playing the audio data after detecting the next subsequent start-of-frame (SOF) packet.

T0055-01

Figure 29. Initial Sequence

Play, Stop, and Detach Sequence

When the host finishes or aborts the playback, the PCM2704/5/6/7 stops playing after completing the output of the last audio data.

Figure 30. Play, Stop, and Detach

Suspend and Resume Sequence

The PCM2704/5/6/7 enters the suspend state after the USB bus has been in a constant idle state for approximately 5 ms. While the PCM2704/5/6/7 is in the suspend state, \overline{SSPND} flag (pin 27 for PCM2704/5, pin 11 for PCM2706/7) is asserted. The PCM2704/5/6/7 wakes up immediately when detecting the non-idle state on the USB bus.

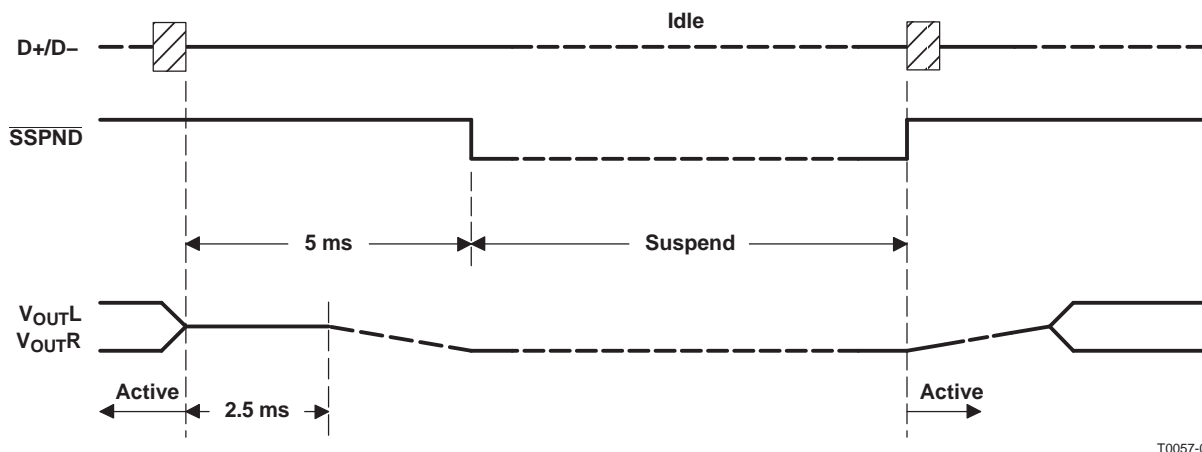

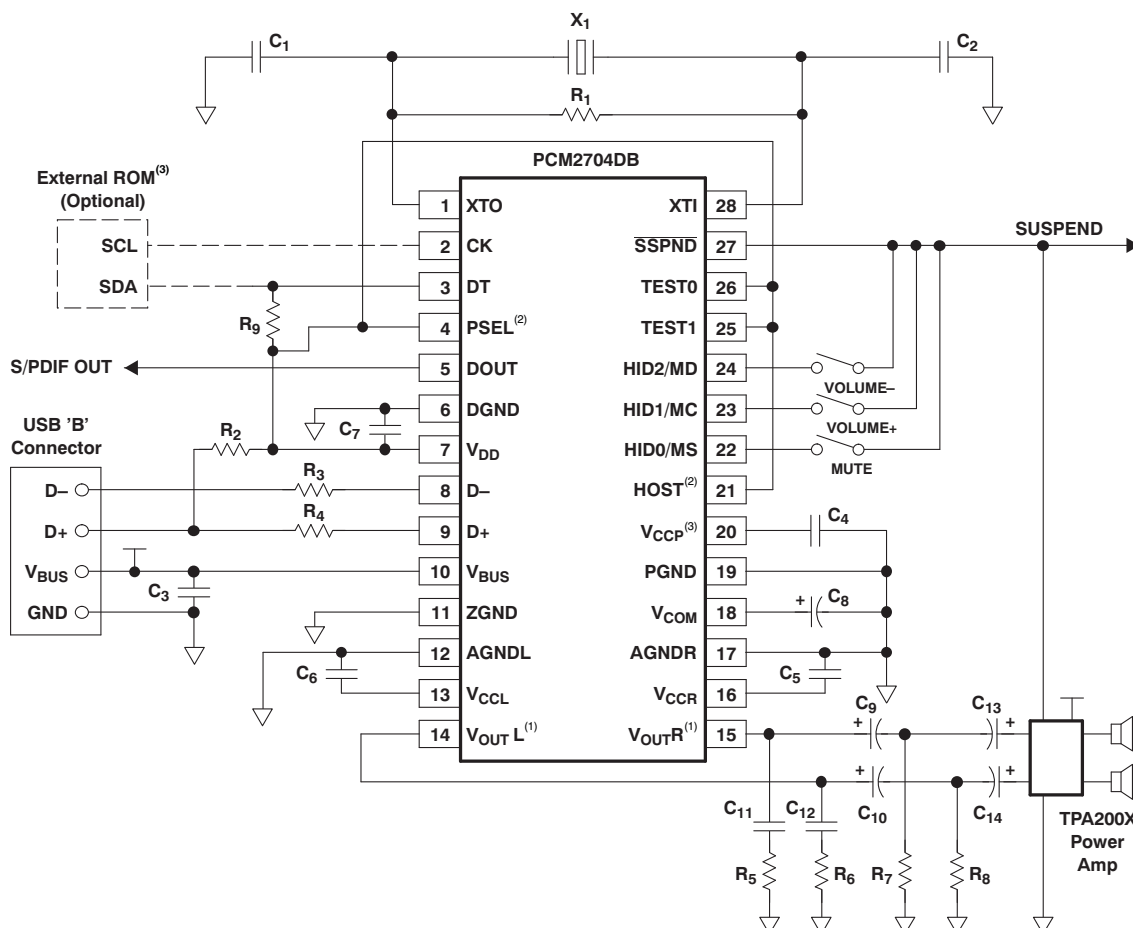

Figure 31. Suspend and Resume

Typical Circuit Connection 1 (Example of USB Speaker)

Figure 32 illustrates a typical circuit connection for an internal-descriptor, bus-powered, 500-mA application.

NOTE: X₁: 12-MHz crystal resonator. C₁, C₂: 10-pF to 33-pF capacitor (depending on load capacitance of crystal resonator). C₃-C₇: 1-μF ceramic capacitor. C₈: 10-μF electrolytic capacitor. C₉, C₁₀: 100-μF electrolytic capacitor (depending on tradeoff between required frequency response and discharge time for resume). C₁₁, C₁₂: 0.022-μF ceramic capacitor. C₁₃, C₁₄: 1-μF electrolytic capacitor. R₁: 1 MΩ resistor. R₂, R₉: 1.5 kΩ resistors. R₃, R₄: 22 Ω resistors. R₅, R₆: 16 Ω resistors. R₇, R₈: 330 Ω resistors (depending on tradeoff between required THD performance and pop-noise level for suspend).

(1) Output impedance of V_{OUTL} and V_{OUTR} during suspend mode or lack of power supply is 26 kΩ ±20%, which is the discharge path for C₉ and C₁₀.

(2) Descriptor programming through external ROM is only available when PSEL and HOST are high.

(3) External ROM power can be supplied from V_{CCP}, but any other active component must not use V_{CCP}, V_{CCCL}, V_{CCR}, or V_{DD} as a power source.

Figure 32. Bus-Powered Application

NOTE:

The circuit illustrated in Figure 32 is for information only. The entire board design should be considered to meet the USB specification as a USB-compliant product.

Typical Circuit Connection 2 (Example of Remote Headphone)

Figure 33 illustrates a typical circuit connection for a bus-powered, 100-mA headphone with seven HIDs.

NOTE: X₁: 12-MHz crystal resonator. C₁, C₂: 10-pF to 33-pF capacitors (depending on load capacitance of crystal resonator). C₃-C₅, C₇, C₈: 1-μF ceramic capacitors. C₆: 10-μF electrolytic capacitor. C₉, C₁₀: 100-μF electrolytic capacitors (depending on required frequency response). C₁₁, C₁₂: 0.022-μF ceramic capacitors. R₁: 1 MΩ resistor. R₂, R₁₁: 1.5 kΩ resistors. R₃, R₄: 22 Ω resistors. R₅, R₆: 16 Ω resistors. R₇-R₁₀: 3.3 kΩ resistors.

(1) Output impedance of V_{OUTL} and V_{OUTR} during suspend mode or lack of power supply is 26 kΩ ±20%, which is the discharge path for C₉ and C₁₀.

(2) Descriptor programming through external ROM is only available when PSEL and HOST are high.

(3) External ROM power can be supplied from V_{CCP}, but any other active component must not use V_{CCP}, V_{CCL}, V_{CCR}, or V_{DD} as a power source.

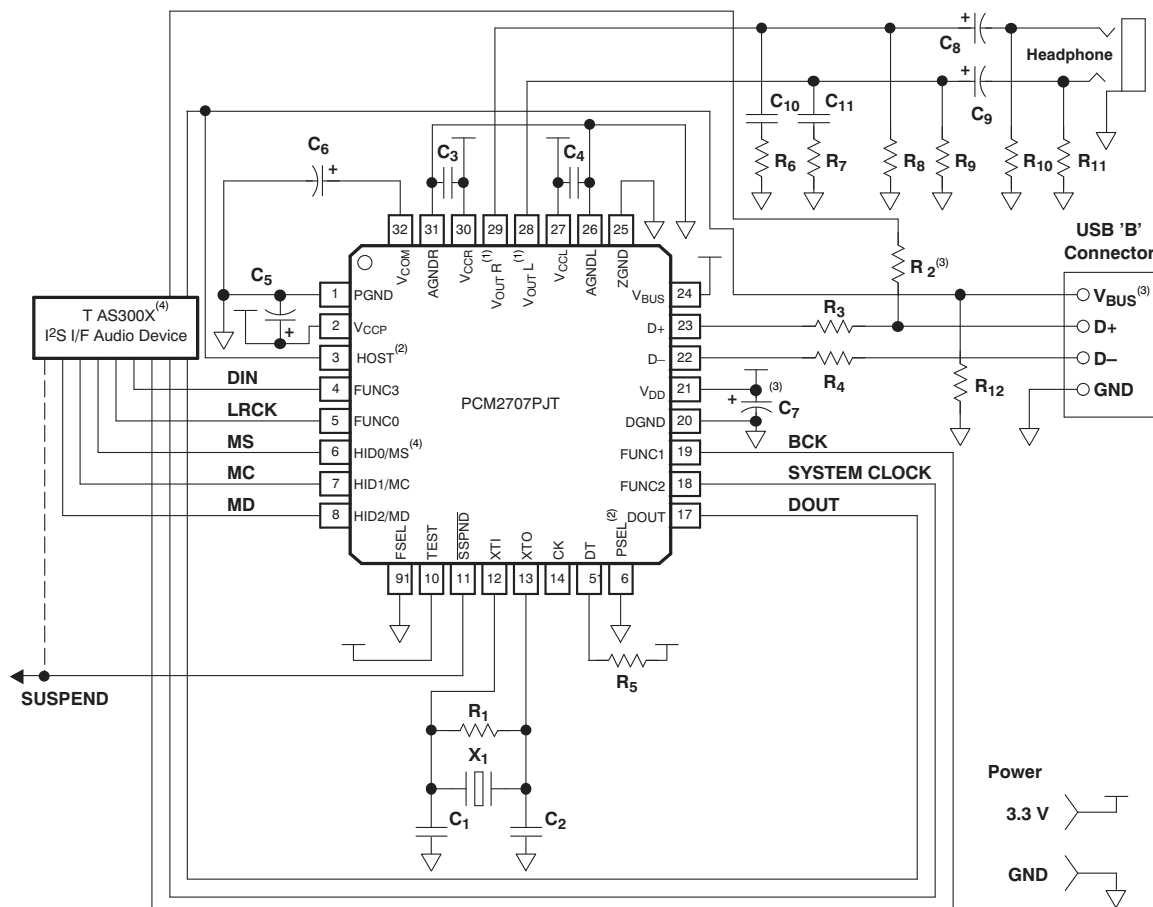

Figure 33. Bus-Powered Application

NOTE:

The circuit illustrated in Figure 33 is for information only. The entire board design should be considered to meet the USB specification as a USB-compliant product.

Typical Circuit Connection 3 (Example of DSP Surround Processing Amp)

Figure 34 illustrates a typical circuit connection for an I²S- and SPI-enabled self-powered application.

NOTE: X₁: 12-MHz crystal resonator. C₁, C₂: 10-pF to 33-pF capacitors (depending on load capacitance of crystal resonator). C₃, C₄: 1-μF ceramic capacitors. C₅, C₇: 0.1-μF ceramic capacitor and 10-μF electrolytic capacitor. C₆: 10-μF electrolytic capacitors. C₈, C₉: 100-μF electrolytic capacitors (depending on required frequency response). C₁₀, C₁₁: 0.022-μF ceramic capacitors. R₁, R₁₂: 1 MΩ resistors. R₂, R₅: 1.5 kΩ resistors. R₃, R₄: 22 Ω resistors. R₆, R₇: 16 Ω resistors. R₈-R₁₁: 3.3 kΩ resistors.

(1) Output impedance of V_{OUTL} and V_{OUTR} during suspend mode or lack of power supply is 26 kΩ ±20%, which is the discharge path for C₈ and C₉.

(2) Descriptor programming through SPI is only available when PSEL and HOST are high.

(3) D+ pull-up must not be activated (HIGH: 3.3V) while the device is detached from USB or power supply is not applied on V_{DD} and V_{CCX}. V_{BUS} of USB (5V) can be used to detect USB power status.

(4) MS must be high until the PCM2707 power supply is ready and the SPI host (DSP) is ready to send data. Also, the SPI host must handle the D+ pull-up if the descriptor is programmed through the SPI. D+ pull-up must not be activated (HIGH = 3.3 V) before programming of the PCM2707 through the SPI is complete.

Figure 34. Self-Powered Application

NOTE:

The circuit illustrated in Figure 34 is for information only. The entire board design should be considered to meet the USB specification as a USB-compliant product.

APPENDIX

Operating Environment

For current information on the PCM2704/2705/2706/2707 operating environment, see the *Updated Operating Environments for PCM270X, PCM290X Applications* application report, [SLAA374](#), available through the TI web site at www.ti.com.

REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (November 2007) to Revision F	Page
• Added new feature	1
• Moved text to end of Digital Audio Interface-S/PDIF Output section.....	19
• Added Descriptor Data Modification paragraph.....	21
• Deleted <i>HOST</i> from list of circuit configuration terms.....	21
• Deleted <i>HOST</i> from list of circuit configuration terms.....	25
• Added notes to Figure 32, Figure 33, and Figure 34 for clarifying requirement of descriptor programing.....	28

Changes from Revision D (December 2006) to Revision E	Page
• Deleted operating environment information from data sheet and added reference to application report	31

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

PLASTIC SMALL-OUTLINE

28 PINS SHOWN

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
 D. Falls within JEDEC MO-150

PJT (S-PQFP-N32)

PLASTIC QUAD FLATPACK

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-026

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
