# To learn more about ON Semiconductor, please visit our website at www.onsemi.com

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at <a href="www.onsemi.com">www.onsemi.com</a>. Please email any questions regarding the system integration to Fairchild <a href="guestions@onsemi.com">guestions@onsemi.com</a>.

#### FAN105AM6X

# Offline Primary-Side-Regulation (PSR) Quasi-Resonant Valley Switch Controller

FAN105A is offline Primary-Side-Regulation (PSR) PWM controller with Quasi-Resonant (QR) mode controller to achieved constant-voltage (CV) and constant-current (CC) control for Travel Adaptor (TA) requirement, and provide cost-effective, simplified circuit for energy-efficient power supplies.

FAN105A integrates proprietary operation of energy saving feature at no load, mWSaver Technology that combines our most energy efficient process and circuit technologies for power adapter design.

FAN105A can be used in Travel Adapter design by stand-alone or co-work with secondary-side SR controller FAN6240. When paired FAN105A with FAN6240, SR is compatible to achieve higher power applications.

#### **Features**

- mWSaver® Technology Provides Ultra-Low Standby Power Consumption for Energy Star's 5-Star Level (<30 mW with HV FET)</li>
- Constant-Current (CC) and Constant-Voltage(CV) with Primary-Side Regulation Eliminates Secondary-Side Feedback Component
- Valley Switch Operation for Highest Average Efficiency
- Programmable Cable Drop Compensation(CDC) with One External Resistor
- Low EMI Emissions and Common Mode Noise
- Cycle-by-Cycle Current Limiting
- Output Short-Circuit Protection
- Scondary side Rectifier Short Detection via Current Sense Protection(CSP)
- Integrated Constant Current Compensation for Precise CC Regulation
- Output Over-Voltage Protection (VSOVP)
- Output under-Voltage Protection (VSUVP)
- VDD Over-Voltage Protection (VDD OVP)
- Internal Thermal-Shutdown Protection (OTP)
- Programmable Brown-In and Brown-Out Protection

#### **Typical Applications**

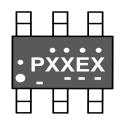

- Travel Adapter for Smart Phones, Feature Phones, and Tablet PCs
- AC-DC Adapters for Portable Devices that Require CV/CC Control

#### **PIN CONNECTIONS**

#### ORDERING INFORMATION

Part Number	Operating Temperature Range	Package	Packing Method
FAN105AM6X	-40 °C ~125°C	6-Lead, SOT23	Tap & Reel

For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

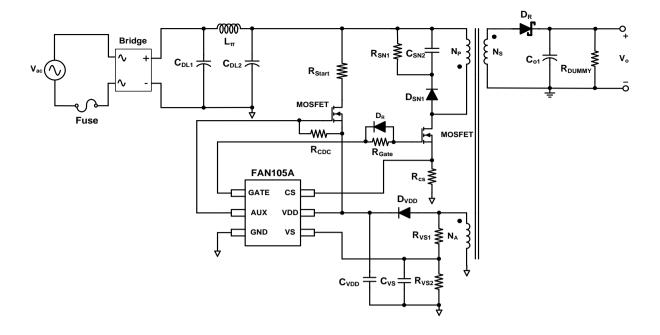

Figure 1. FAN105A Typical Application Schematic

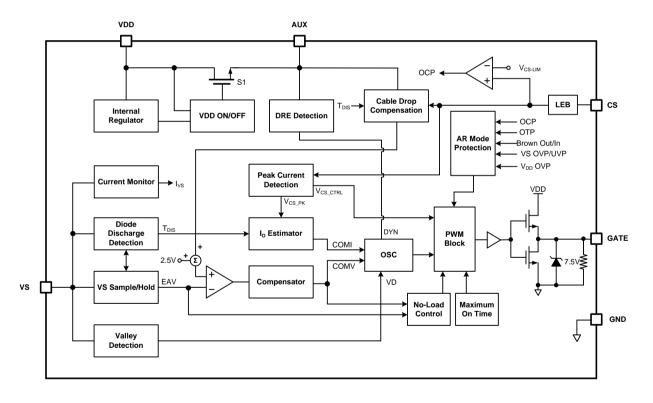

Figure 2.FAN105A Function Block Diagram

#### **PIN FUNCTION DESCRIPTION**

Pin #	Name	Description
1	Current Sense. This pin connects to a current-sense resistor to detect the MOSF current for Peak-Current-Mode control for output regulation. The current-sense information is also used to estimate the output current for CC regulation.	
2	GND	Ground
3	GATE	<b>PWM Signal Output</b> . This pin has an internal totem-pole output driver to drive the power MOSFET. The gate driving voltage is internally clamped at 7.5 V.
4	VDD	<b>Power Supply</b> . IC operating current and MOSFET driving current are supplied through this pin. This pin is typically connected to an external V <sub>DD</sub> capacitor.
5	VS	Voltage Sense. This pin detects the output voltage information and diode current discharge time based on the voltage of auxiliary winding. It also senses sink current through the auxiliary winding to detect input voltage information.
6	AUX	<b>Auxiliary Function.</b> This pin generates one voltage level proportional to output current to compensate output voltage drop due to cable resistance. The pin is also used for startup with external HV FET. Integrated Dynamic Response Enhancement (DRE) function through secondary feedback signal.

#### **ABSOLUTE MAXIMUM RATINGS** (Note 1,2,3,4)

Parameter			Min.	Max.	Unit
DC Supply Voltage			-0.3	30	V
AUX Pin Input Voltage		$V_{AUX}$	-0.3	30	V
VS Pin Input Voltage		V <sub>VS</sub>	-0.3	6.0	V
CS Pin Input Voltage			-0.3	6.0	V
Power Dissipation (T <sub>A</sub> =25°C)				0.391	mW
Operating Junction Temperature			-40	+150	°C
Storage Temperature Range		T <sub>STG</sub>	-60	+150	°C
Lead Temperature (Soldering, 10 Seconds)				+260	°C
Floatroatatia Diacharga Canability	Human Body Model, ANSI/ESDA/JEDEC, JESD22_A114	ESD	>1.5		I-\ /
Electrostatic Discharge Capability	Charged Device Model, JEDEC:JESD22_C101	ESD	>(	).5	kV

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

- 2.
- All voltage values, except differential voltages, are given with respect to the GND pin.

  Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. 3.
- Meets JEDÉC standards JS-001-2012 and JESD 22-C101.

#### THERMAL CHARACTERISTICS (Note 5)

Parameter	Symbol	Min.	Max.	Unit
Junction-to-Ambient Thermal Impedance	$\theta_{JA}$		242	°C/W
Junction-to-Top Thermal Impedance	$\theta_{\text{JT}}$		56	°C/W

T<sub>A</sub>=25°C unless otherwise specified.

#### **RECOMMENDED OPERATING RANGES (Note 6)**

Parameter	Symbol	Min.	Max.	Unit
CS Pin Input Voltage	V <sub>CS</sub>	0	0.8	V
Gate Pin Input Voltage	V <sub>GATE</sub>	0	8.0	V
VDD Pin Input Voltage	V <sub>DD</sub>	7.0	25	V
VS Pin Input Voltage	V <sub>VS</sub>	1.6	3.2	V
AUX Pin Input Voltage	$V_{AUX}$	5.0	25	V

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance. On Semiconductor does not recommend exceeding them or designing to Absolute Maximum Ratings.

#### **Functional Description**

FAN105A is an offline PWM and Primary-Side Regulated (PSR) fly-back controller that can simplify feedback circuit and secondary side circuit compare to traditional fly-back converter. In addition, FAN105A detects Quasi-Resonant valley switching to minimize the switching loss and get better EMI performance.

FAN105A modulates pulse width and switching frequency based on feedback signal auxiliary winding signal (VS) and current sense signal (CS). Extremely accurately Constant Voltage(CV) with Cable Drop Compensation (CDC) and Constant Current (CC) could meet strict requirement from market. The CV and CC output characteristic is shown as Figure 23. There are 4 levels (80mV - 320mV) choices in CDC compensation weighting that is easily set via external SMD resistor.

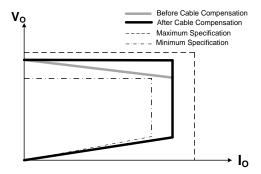

Figure 23.CV with CDC and CC V/I Curve at the Cable End

FAN105A implements DeeP GreeN mode (DPGN) with lowest switching frequency, limites IC current consumption (450 $\mu$ A) for excellent system standby power performance. Furthermore, the system design allowes two kinds of startup circuit with resistor or high voltage FET.

Protections are : over/under voltage protection (VSOVP, VSUVP), Brown In and Brown Out, cycle by cycle over current protection(OCP), current sense resistor short protection, secondary rectifier short protection.

#### **Basic CV/CC Control Principle**

Figure 24 shows the circuit diagram of a PSR fly-back converter, FAN105A estimates output current through primary side peak current from CS, output voltage via auxiliary winding signal that proportional to secondary side voltage, the current and voltage sampling are shown in Figure 25. Generally, Discontinuous Conduction Mode (DCM) with valley switching operation is preferred for PSR since it allows better output regulation. The operation principles of DCM/BCM flyback converter are as follows:

During the MOSFET turn on time ( $t_{ON}$ ), input voltage ( $V_{DL}$ ) is applied across the primary-side inductor ( $L_m$ ). Then MOSFET current ( $I_{DS}$ ) increases linearly from zero to the peak value ( $I_{pk}$ ). Meanwhile, the energy is drawn from the input and stored in the inductor.

When the MOSFET is turned off, the energy stored in the inductor forces the secondary diode ( $D_{\rm sec}$ ) to turn on. While the diode is conducting, the output voltage ( $V_{\rm o}$ ), together with diode forward voltage drop ( $V_{\rm F}$ ), are applied across the secondary-side inductor ( $L_m \times N_s^2/N_\rho^2$ ) and the diode current ( $I_{\rm D}$ ) decreases linearly from the peak value ( $I_{\rm pk} \times N_{\rm p}/N_{\rm s}$ ) to zero. At the end of inductor current discharge time ( $I_{\rm DIS}$ ), all the energy stored in the inductor has been delivered to the output.

When the diode current reaches zero, the transformer auxiliary winding voltage ( $V_{Aux}$ ) begins to oscillate by the resonance between the primary-side inductor ( $L_m$ ) and the effective capacitor loaded across MOSFET.

During the inductor current discharge time, the sum of output voltage and diode forward-voltage drop is reflected to the auxiliary winding side as  $(V_o + V_F) \times N_{Aux}/N_s$ . Since the diode forward-voltage drop decreases as current decreases, the auxiliary winding voltage reflects the output voltage best at the end of diode conduction time, where the diode current diminishes to zero. By sampling the winding voltage at the end of the diode conduction time, the output voltage information can be obtained. The internal error amplifier for output voltage regulation (EAV) compares the sampled voltage with internal precise reference to generate error voltage (COMV), which determines the duty cycle of the MOSFET in CV Mode.

The output current is obtained by averaging the triangular output diode current area over a switching cycle as:

$$I_{O} = \langle I_{D} \rangle_{AVG} = \frac{1}{2} \cdot I_{PK} \cdot \frac{N_{P}}{N_{S}} \cdot \frac{T_{DIS}}{T_{S}}$$

$$\tag{1}$$

The internal FAN105A circuits identify the peak value of the drain current with a peak detection circuit and calculate the output current using the inductor discharge time ( $t_{DIS}$ ) and switching period ( $t_{S}$ ). This output information (EAI) is compared with internal precise reference to generate error voltage (COMI), which determines the duty cycle of the MOSFET in CC Mode. With TRUECURRENT® technique, constant output current can be precisely controlled.

With a given current sensing resistor, the output current can be programmed as:

$$I_O = \frac{1}{6} \cdot \frac{N_P}{N_S} \cdot \frac{V_{CCR}}{R_{CS}} \tag{2}$$

Of the two error voltages, COMV and COMI, the smaller one determines the duty cycle. During Constant Voltage regulation, COMV determines the duty cycle while COMI is saturated to HIGH. During Constant Current regulation, COMI determines the duty cycle while COMV is saturated to HIGH.

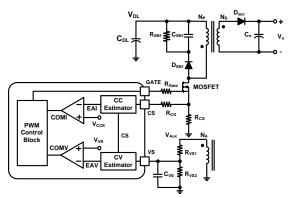

Figure 24.Simplified PSR Flyback Converter Circuit

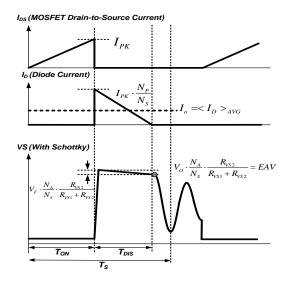

Figure 25. Cycling Current and VS Sampling in DCM

#### **Quasi-Resonant Valley Switch**

FAN105A Build-In Quasi-Resonant valley detecting function and inductor discharging time detecting function. During MOSFET turn off period, FAN105A checked falling of VVS, TDIS information will update as falling of VVS checked. FAN105A keep monitor both VVS and IVS after TDIS checked. FAN105A maximum period of MOSFET on time and off time could be reach 45µs, it was depending on whether valley checked. Quasi-Resonant valley switching could minimize MOSFET switching loss during switch on, meanwhile, to eliminate EMI and Common mode switching component noise. Charger system would be getting better efficiency than non-valley switching methodology.

#### **Output Voltage Sampling**

VS voltage which is reflected auxiliary winding and proportional to output voltage. Therefore, It is possible to regulate output voltage by sensing VS voltage. Figure 26 shown VS sampling waveform with secondary rectifier that using Schottky diode or Synchronous Rectifier (SR).

In order to regulate output voltage in accurately range, FAN105A build-in VS sampling methodology for signal like Figure 26 showed, FAN105A samples and hold VS voltage

as EAV at timing like gray point showed. Base on EAV level to regulate Pulse width to achieve estimation output voltage.

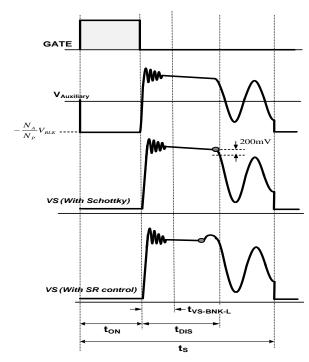

Figure 26.VS sampling with Diode or Synchronous Rectifier

A leading edge blanking time( $t_{VS-BNK-H/L}$ ) start from primary switch turned off, that is caused by the resonance of leakage inductance and parasistic capacitance at transformer. In order to avoid VS sampling procedure get impacted by that ringing, the oscillation should be settle before settle down before  $t_{VS-BNK-L}$  ended as Figure 26 showed.  $t_{DIS}$  is secondary rectifier current discharging time which recommend better design is longer than  $t_{VS-BNK-H}$  during milmum on time controlling.  $t_{DIS}$  is predictable by following formula:

$$t_{DIS} = \frac{V_{DL}(t_{ON-MIN} + t_{OFF-DELAY})}{(V_o + V_D)} \cdot \frac{N_S}{N_P}$$
 (3)

Where parameter:  $t_{\text{OFF-DELAY}}$  is switch turn off delay time that level is chaging in differences system criteria,  $t_{\text{ON-MIN}}$  is minimum turn on time in design that should consider propagation delay from IC Gate to switch Gate.

The output voltage can be describe by below equation:

$$V_O = V_{VR} \cdot (1 + \frac{R_{VS1}}{R_{VS2}}) \cdot \frac{N_S}{N_A}$$
 (4)

## Deep Green Mode (DPGN) Operation in CV mode

FAN105A integrated mWSaver® technology that minimize current consumption and frequency at DPGN mode is fixed to minimum switching frequency ( $f_{OSC\text{-}DPGN}$ ) and variable Pulse width based on VS sampling voltage (EAV).  $V_{VS}$  regulated boundary are between  $V_{VS\text{-}EAV\text{-}H}$  and  $V_{VS\text{-}EAV\text{-}L}$ .

13

After exit DPGN, internal regulation reference voltage was changed to  $\ensuremath{V_{VR}}.$ 

FAN105A DPGN entry and exit criteria showed as below:

□ DPGN entry need to meet both criteria as below:

- Minimum frequency (fosc-MIN) operation continues over than N<sub>DPGN-Entry</sub> switching cycles.
- EAV > V<sub>VS-EAV-H</sub>(2.550V).

□ DPGN exit criteria, meet one of below criteria:

- EAV < V<sub>VS-EAV-L</sub> (2.525V) and maximum on time at DPGN.
- EAV < V<sub>VS-EAV-DYN</sub>(2.4V).

During the DPGN mode controlling, FAN105A decreases the operating current down to  $450\mu A$ . Therefore, the standby power could meet international standard requirement when work with flexible start up circuit, designer have flexible start up circuit that HV FET or start up resistor depending on cost and better standby power consideration

#### **Cable Drop Compensation (CDC)**

FAN105A integrates cable drop compensation function and the compensation weighting is calculated based on  $t_{\rm DIS}$ , current sense voltage (Vcs), and CDC setting resistor (RcDC) needed to between VDD and AUX pin. During startup, as VDD reached VDD-ON, CDC programming block detects AUX pin current and determine cable drop compensation weighting based on current weighting of AUX pin. Once finished CDC compensation weighting detecting, the information will stored until shunt-down by protections or VDD lower than VDD-OFF. The CDC weighting automatic detected input current during start up. which provides a constant output voltage at the end of the cable over the entire load range in CV Mode. The table shows the compensation weighting with corresponding  $R_{\rm CDC}$  setting as below:

CDC Weighting and R <sub>CDC</sub> Setting						
R <sub>CDC</sub>	Label	V <sub>VS</sub> Compensation Weighitng				
1.3ΜΩ	V <sub>VS-CDC1</sub>	0.08V				
920kΩ	$V_{VS\text{-}CDC2}$	0.16V				
560kΩ	V <sub>VS-CDC3</sub>	0.24V				
330kΩ	$V_{VS\text{-}CDC4}$	0.32V				

TA designer can easily to set up CDC weighting via choose  $R_{\text{CDC}}$  following above table. In the table, resisance of  $R_{\text{CDC}}$  is recommended for corresponding compensation level. Cable drop compensation voltage at output is proportional to  $V_{\text{VS}}$  compensation weighting that is internal referce voltage for CDC compensation.

#### Programmable Brown In/ Brown Out

FAN105A implement Brown out and Brown In through high side resistor setting at VS PIN. In actual system operation, VS PIN is drain a current ( $I_{VS}$ ) that proportional to line voltage during MOSFET turns on. IVS could predict by below equation:

$$I_{VS} = V_{DL} \cdot \frac{N_A}{N_P} \cdot \frac{1}{R_{VS1}} \tag{5}$$

#### **Operating Current**

The operating current in FAN105A is as small as 1.4mA. The small operating current results in higher efficiency and reduces the  $V_{\text{DD}}$  hold-up capacitance requirement. During DPGN mode, the FAN105A consumption current is reduced to 450 $\mu\text{A}$ , assisting the power supply meet standby power standard requirements.

#### **Protections**

The FAN105A self-protection includes  $V_{DD}$  Over-Voltage-Protection ( $V_{DD}$  OVP), Internal Chip Over-Temperature-Protection (OTP), VS Over-Voltage Protection (VSOVP), VS Under-Voltage Protection (VSUVP), CS pin Protection(CSP), Brownout and Brown In protection, and all of protection are implemented as Auto Restart(AR) mode.

When an Auto-Restart Mode protection is triggered, switching is terminated and the MOSFET remains off, causing  $V_{DD}$  to drop till  $V_{DD\text{-}OFF}$  and shut-down the system then all protections are reset. After then  $V_{DD}$  will be charged again by the input AC voltage and once touch  $V_{DD\text{-}ON}$  then switching resumes. This is the reason why it is called Auto-Restart, resumes switching automatically.

#### V<sub>DD</sub> Over-Voltage-Protection(V<sub>DD</sub> OVP)

When  $V_{DD}$  is raised up to higher level by some reasons, transformer  $V_{DD}$  winding turns are too many, load regulation is not good between transformer winding, VS information is not available anyhow and so on, and touches  $V_{DD\text{-}OVP}$ , then FAN105A stops switching and protects IC from higher  $V_{DD}$  voltage. This is different then output voltage is over than pre determined level.

#### VS Under-Voltage Protection (VSUVP)

FAN105A bulid-in VSUVP function that prevent TA keep deliver power to phone side when output voltage is under the set voltage at VS pin. VSUVP has a 40ms de-bounce time and once VDD touches  $V_{\text{DD-ON}}$ , during the later 40ms VSUVP is disabled because VSUVP should not be triggered during the start up. VSUVP level can be calculated as below:

$$V_{O-UVP} = V_{VS-UVP} \cdot (1 + \frac{R_{VS1}}{R_{VS2}}) \cdot \frac{N_S}{N_A}$$
 (6)

VS Over-Voltage Protection (VSOVP)

The VSOVP is designed to prevent TA output voltage is over then the rating of used components, like capacitor. VSOVP has 4 switching cycles of denounce time and that prevent mis-triggered of VSOVP by switching noise. The protection level is changed in proportional to the CDC weighting.

VSOVP trigger level can be illustrates as following formula:

$$V_{O-OVP} = (V_{VS-OVP} + V_{VS-CDC} \cdot \frac{I_O}{I_{O-CC}}) \cdot (1 + \frac{R_{VS1}}{R_{VS2}}) \cdot \frac{N_S}{N_A}$$
 (7)

#### CS pin Protection(CSP)

In order to prevent MOSFET current over than safe operating area, FAN105A build-in cycle by cycle over current protection. The protection could protect MOSFET damaged by saturation current and CS pin sensing error. As CS PIN signal meet below conditions FAN105A will turn off Gate immediately. Current Sensing Protection (CSP) criteria shows as below:

- V<sub>CS</sub> <0.2V after switching turn on 4.5us at low line or 1.5us at high line.
- V<sub>CS</sub>>1.5V

#### Over-Temperature Protection(OTP)

In order to guarantee FAN105A works within recommended temperature. FAN105A build-in chip Over-Temperature – Protection (OTP). As chip junction temperature over thareshold T<sub>OTP-H</sub> IC immediately terminated Gate switching signal untill chip junction temperature recover to T<sub>OTP-L</sub>.

#### **Start Up Function With AUX**

FAN105A supports high voltage start up with HV FET that can make better standby power and shorter start up time. Figure 27 shows start up controlling function block. Figure 28 shows start up relative signal sequence with AUX controlling.

At system power on moment, initial VDD voltage is zero, internal PMOS switch is turn on and external high voltage FET also turn on,  $C_{VDD}$  is charged through HV FET till VDD reach  $V_{DD\text{-}ON}.$  While Internal PMOS switch S1 turn off and VGS of HV FET will close to internal clamping voltage  $(V_{AUX\text{-}CL})$  which less than HV FET VGS turn on threshold. Meanwhile VDD energy supplement is turn to auxiliary winding. The voltage gap between VDD and VAUX is keep at 5V till controller shut-down by protection or VDD touching  $V_{DD\text{-}OFF}.$

# Accurately Constant Current (CC) Compensation

FAN105A provides accurate constant current with universal line voltage range, In order to achieve this accurately output current regulated, FAN105A build in circuits that compensate a DC level at CS signal based on difference line voltage. It could avoid output current gap of difference line voltage during constand current controlling. For noise immunity, the recommendation of CS pin series resistor is  $10\Omega$ .
