

MAX17690B No-Opto Flyback Evaluation Kit

Evaluates: MAX17690

General Description

The MAX17690B evaluation kit (EV kit) is a fully assembled and tested circuit board that demonstrates the operation of an isolated 5W no-opto flyback DC-DC converter. This circuit uses a MAX17690 in a 16-pin TQFN package with an exposed pad. The data sheet must be read in conjunction with this quick start guide for demo circuit.

The EV kit output is configured for an isolated +5V and provides up to 1A of output current. The device switches at a 180kHz switching frequency. The transformer provides the galvanic isolation between input and output, up to 1875VAC.

Features

- 18V to 36V Input Range
- Isolated Output: 5V/1A DC
- Compact Design with High-Frequency (180kHz) Switching
- Minimum Number of External Components
- 85.8% Peak Efficiency
- Low-Cost Flyback Design
- Galvanic Isolation up to 1875VAC
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

Quick Start

Recommended Equipment

- One 18V–36V DC, 1A power supply
- 5W resistive load with 1A sink capacity
- Four digital multimeters (DMM)
- MAX17690EVKITB#

Warning:

- Do not turn on the power supply until all connections are completed.
- Wear protective eye gear at all times.
- Do not touch any part of the circuit with bare hands or conductive materials when powered up.
- Make sure all high-voltage capacitors are fully discharged before handling. Allow 5 minutes after disconnecting the input power source before touching circuit parts.

Equipment Setup and Test Procedure

- 1) Set the power supply to +24VDC. Disable the power supply output.
- 2) Connect the positive terminal of the power supply to the V_{IN} PCB pad and the negative terminal to the nearest PGND PCB pad. Connect the positive terminal of the electronic load to the V_{OUT} PCB pad and the negative terminal to the nearest GND0 PCB pad.
- 3) Connect the resistive load across the output terminals.
- 4) Connect a DMM configured in voltmeter mode across the V_{OUT} PCB pad and the nearest GND0 PCB pad.
- 5) Enable the power supply.
- 6) Verify that the output voltmeter displays 5V and, if required, measure the output current using a DMM in Ammeter mode.
- 7) If required, vary the input voltage from 18V to 36V, the load current from 0mA to 1A, and verify that output voltage is 5V.

MAX17690B No-Opto Flyback Evaluation Kit

Evaluates: MAX17690

Detailed Description

The MAX17690B EV kit provides a proven design to evaluate the MAX17690 high-efficiency DC-DC flyback converter. The device uses a novel sampling technique to eliminate the optocoupler in the output voltage sensing across the isolation boundary. The transformer design, as

well as the selection of different components, are detailed in the MAX17690 IC data sheet.

This EV kit provides the programmable soft-start time to limit the inrush current. The IC has overcurrent and thermal protection.
