

Advanced PMU for Multi-core Application Processors

FEATURES

INTEGRATED POWER SUPPLIES

- Four DC/DC Step-Down (Buck) Regulators
 - 2 x 2.8A, 2 x 1.5A
- Five Low-Noise LDOs
 - 2 x 150mA, 3 x 350mA
- Three Low-Input Voltage LDOs
 - 1 x 150mA, 2 x 350mA
- One Low IQ Keep-Alive LDO
- Backup Battery Charger

SYSTEM CONTROL AND INTERFACE

- Six General Purpose I/O with PWM Drivers
- I²C Serial Interface
- Interrupt Controller

SYSTEM MANAGEMENT

- Reset Interface and Sequencing Controller
 - Power on Reset
 - Soft / Hard Reset
 - Watchdog Supervision
 - Multiple Sleep Modes
- Thermal Management Subsystem

APPLICATIONS

- Tablet PC
- Mobile Internet Devices (MID)
- Ebooks
- Personal Navigation Devices

GENERAL DESCRIPTION

The ACT8847 is a complete, cost effective, and highly-efficient *ActivePMU*[™] power management solution optimized for the power, voltage sequencing and control requirements of Samsung Exynos 4210 (S5PC210/S5PV310) and other application processors. (Please See Ordering Information Section and its Appendix.)

The ACT8847 features four fixed-frequency, current-mode, synchronous PWM step-down converters that achieve peak efficiencies of up to 97%. These regulators operate with a fixed frequency of 2.25MHz, minimizing noise in sensitive applications and allowing the use of small external components. These buck regulators supply up to 2.8A of output current and can fully satisfy the power and control requirements of the multi-core application processor. Dynamic Voltage Scaling (DVS) is supported either by dedicated control pins, or through I²C interface to optimize the energy-per-task performance for the processor. This device also include eight low-noise LDOs (up to 350mA per LDO), one always-ON LDO and an integrated backup battery charger to provide a complete power system for the processor.

The power sequence and reset controller provides power-on reset, SW-initiated reset, and power cycle reset for the processor. It also features the watchdog supervisory function. Multiple sleep modes with autonomous sleep and wake-up sequence control are supported.

The thermal management and protection subsystem allows the host processor to manage the power dissipation of the PMU and the overall system dynamically. The PMU provides a thermal warning to the host processor when the temperature reaches a certain threshold such that the system can turn off some of the non-essential functions, reduce the clock frequency and etc to manage the system temperature.

The ACT8847 is available in a compact, Pb-Free and RoHS-compliant TQFN66-48 package.

| PACKAGE | PINS | TEMPERATURE RANGE |
|-----------|------|-------------------|
| TQFN66-48 | 48 | -40°C to +85°C |

①: All Active-Semi components are RoHS Compliant and with Pb-free plating unless specified differently. The term Pb-free means semiconductor products that are in compliance with current RoHS (Restriction of Hazardous Substances) standards.

②: The Package Code designator “Q” represents QFN.

③: The Pin Count designator “M” represents 48 pins.

④: “xxx” represents the CMI (Code Matrix Index) option. The CMI identifies the IC’s default register settings.

⑤: ACT8847QM174-T is dedicated to S5PV310 application.

⑥: ACT8847 Data Sheet is described according to ACT8847QM171-T application; please see the Appendix of ACT8847QM211-T for its specification.

⑦: ACT8847QM600-T and ACT8849QM614-T is the association application for Samsung Exynos 4412/ 4212 platforms; please see the Appendix of APP_ACT8847 ACT8849_Rev0_16JUN14_P for its specification.

⑧: ACT8847QM502-T is dedicated to Freescale i.MX6 application.

⑨: ACT8847QM102-T is dedicated to Freescale i.MX6UL/i.MX6ULL with custom startup and system level considerations

PIN CONFIGURATION

TOP VIEW

Thin - QFN (TQFN66-48)

PIN DESCRIPTIONS

| PIN | NAME | DESCRIPTION |
|--------|---------|---|
| 1, 2 | SW3 | Switch Node for REG3. |
| 3 | GP3 | Power Ground for REG3. Connect GP14, GP2, GP3, and GA together at a single point as close to the IC as possible. |
| 4 | OUT10 | REG10 output. Bypass it to ground with a 2.2μF capacitor. |
| 5 | OUT11 | REG11 output. Bypass it to ground with a 2.2μF capacitor. |
| 6 | INL3 | Power input for REG10, REG11 and REG12. |
| 7 | OUT12 | REG12 output. Bypass it to ground with a 2.2μF capacitor. |
| 8 | VSELR2 | Output Voltage Selection for REG2. Drive to logic low to select default output voltage. Drive to logic high to select secondary output voltage. |
| 9 | nPBSTAT | Active-Low Open-Drain Push-Button Status Output. nPBSTAT is asserted low whenever the nPBIN is pushed, and is high-Z otherwise. |
| 10 | GP2 | Power ground for REG2. Connect GP14, GP2, GP3, and GA together at a single point as close to the IC as possible. |
| 11, 12 | SW2 | Switch Node for REG2. |
| 13, 14 | VP2 | Power input for REG2. Bypass to GP2 with a high quality ceramic capacitor placed as close to the IC as possible. |
| 15 | OUT2 | Output Voltage Sense for REG2. |
| 16 | PWREN | Power enable input. |
| 17 | REFBP | Reference Bypass. Connect a 0.047μF ceramic capacitor from REFBP to GA. This pin is discharged to GA in shutdown. |
| 18 | INL2 | Power Input for REG8, REG9. INL2 must be connected to input power, even if REG8 and REG9 are not used. |
| 19 | OUT9 | REG9 output. Bypass it to ground with a 2.2μF capacitor. |
| 20 | GA | Analog Ground. |
| 21 | OUT4 | Output voltage sense for REG4. |
| 22 | OUT8 | REG8 output. Bypass it to ground with a 2.2μF capacitor. |
| 23 | SDA | Data Input for I ² C Serial Interface. Data is read on the rising edge of SCL. |
| 24 | SCL | Clock Input for I ² C Serial Interface. |
| 25 | VP4 | Power input for REG4. Bypass to GP14 with a high quality ceramic capacitor placed as close to the IC as possible. |

PIN DESCRIPTIONS CONT'D

| PIN | NAME | DESCRIPTION |
|-------|--------|---|
| 26 | SW4 | Switch Node for REG4. |
| 27 | GP14 | Power Ground for REG1 and REG4. Connect GP14, GP2, GP3, and GA together at a single point as close to the IC as possible. |
| 28 | SW1 | Switch Node for REG1. |
| 29 | OUT1 | Output Voltage Sense for REG1. |
| 30 | VP1 | Power Input for REG1. Bypass to GP14 with a high quality ceramic capacitor placed as close to the IC as possible. |
| 31 | nPBIN | Master Enable Input. Drive nPBIN to GA through a 50kΩ resistor to enable the IC, drive nPBIN directly to GA to assert a Manual-Reset condition. |
| 32 | PWRHLD | Power hold Input. PWRHLD is internally pulled down to GA through a 900kΩ resistor. |
| 33 | nRSTO | Open-Drain Reset Output. |
| 34 | nIRQ | Open-Drain Interrupt Output. |
| 35 | GPIO6 | General Purpose I/O #6. Configured as PWM LED driver output for up to 6mA current with programmable frequency and duty cycle. See the <i>PWM LED Drive</i> section for more information. |
| 36 | GPIO5 | General Purpose I/O #5. Configured as PWM LED driver output for up to 6mA current with programmable frequency and duty cycle. See the <i>PWM LED Driver</i> section for more information. |
| 37 | OUT13 | REG13 output. Bypass it to ground with a 2.2μF capacitor. |
| 38 | OUT7 | REG7 output. Bypass it to ground with a 2.2μF capacitor. |
| 39 | GPIO4 | General Purpose I/O #4. Configured as PWM LED driver output for up to 6mA current with programmable frequency and duty cycle. See the <i>PWM LED Driver</i> section for more information. |
| 40 | OUT6 | REG6 output. Bypass it to ground with a 2.2μF capacitor. |
| 41 | INL1 | Power Input for REG5, REG6, REG7. |
| 42 | OUT5 | REG5 output. Bypass it to ground with a 2.2μF capacitor. |
| 43 | GPIO3 | General Purpose I/O #3. Configured as PWM LED driver output for up to 6mA current with programmable frequency and duty cycle. See the <i>PWM LED Drier</i> section for more information. |
| 44 | GPIO2 | General Purpose I/O #2. Configured as VSELR4 for Voltage Selection of REG4. Drive to logic low to select default output voltage. Drive to logic high to select secondary output voltage. |
| 45 | GPIO1 | General Purpose I/O #1. Configured as VSELR3 for Voltage Selection of REG3. Drive to logic low to select default output voltage. Drive to logic high to select secondary output voltage. |
| 46 | OUT3 | Output Voltage Sense for REG3. |
| 47,48 | VP3 | Power input for REG3. Bypass to GP3 with a high quality ceramic capacitor placed as close to the IC as possible. |
| EP | EP | Exposed Pad. Must be soldered to ground on PCB. |

ABSOLUTE MAXIMUM RATINGS^①

| PARAMETER | VALUE | UNIT |
|---|--------------------|------|
| INL1, INL2, INL3 to GA; VP1, SW1, OUT1 to GP14; VP2, SW2, OUT2 to GP2; VP3, SW3, OUT3 to GP3; VP4, SW4, OUT4 to GP14 | -0.3 to 6 | V |
| GP14, GP2, GP3 to GA | -0.3 to + 0.3 | V |
| OUT5, OUT6, OUT7, OUT13 to GA | -0.3 to INL1 + 0.3 | V |
| OUT8, OUT9, GPIO1, GPIO2, GPIO3, GPIO4, GPIO5, GPIO6, VSELR2, nPBIN, nRSTO, nIRQ, nPBSTAT, PWREN, PWRHLD, REFBP, SCL, SDA to GA | -0.3 to INL2 + 0.3 | V |
| OUT10, OUT11, OUT12 to GA | -0.3 to INL3 + 0.3 | V |
| Junction to Ambient Thermal Resistance | 21 | °C/W |
| Operating Ambient Temperature Range | -40 to 85 | °C |
| Operating Junction Temperature | -40 to 125 | °C |
| Storage Temperature | -55 to 150 | °C |
| Lead Temperature (Soldering, 10 sec) | 300 | °C |

①: Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.

I²C INTERFACE ELECTRICAL CHARACTERISTICS

(V_{INL2} = 3.6V, T_A = 25°C, unless otherwise specified.)

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--------------------------------------|--|------|-----|------|------|
| SCL, SDA Input Low | V _{INL2} = 3.1V to 5.5V, T _A = -40°C to 85°C | | | 0.35 | V |
| SCL, SDA Input High | V _{INL2} = 3.1V to 5.5V, T _A = -40°C to 85°C | 1.55 | | | V |
| SDA Leakage Current | | | | 1 | μA |
| SCL Leakage Current | | | | 1 | μA |
| SDA Output Low | I _{OL} = 5mA | | | 0.35 | V |
| SCL Clock Period, t _{SCL} | | 1.5 | | | μs |
| SDA Data Setup Time, t _{SU} | | 100 | | | ns |
| SDA Data Hold Time, t _{HD} | | 300 | | | ns |
| Start Setup Time, t _{ST} | For Start Condition | 100 | | | ns |
| Stop Setup Time, t _{SP} | For Stop Condition | 100 | | | ns |

| LDO rated at 350mA (REG7, REG8 & REG9) | | | | | |
| Dropout Voltage ^③ | $I_{OUT} = 160mA$, $V_{OUT} > 3.1V$ | | 140 | 280 | mV |
| Maximum Output Current | | 350 | | | mA |
| Current Limit ^④ | $V_{OUT} = 95\%$ of regulation voltage | 400 | | | mA |
| Recommend Output Capacitor | | | 2.2 | | μF |

①: V_{NOM} refers to the nominal output voltage level for V_{OUT} as defined by the *Ordering Information* section.

②: I_{MAX} Maximum Output Current.

③: Dropout Voltage is defined as the differential voltage between input and output when the output voltage drops 100mV below the regulation voltage (for 3.1V output voltage or higher).

④: LDO current limit is defined as the output current at which the output voltage drops to 95% of the respective regulation voltage. Under heavy overload conditions the output current limit folds back by 50% (typ.)

LOW-INPUT VOLTAGE LDO ELECTRICAL CHARACTERISTICS

($V_{INL3} = 3.6V$, $C_{OUT10} = C_{OUT11} = C_{OUT12} = 2.2\mu F$, $T_A = 25^\circ C$, unless otherwise specified.)

SYSTEM CONTROL INFORMATION

Interfacing with the Samsung S5PC210/S5PV310 processors

The ACT8847 is optimized for the Samsung S5PC210/S5PV310 and other application processors, supporting both the power domains as well as the signal interface. The following paragraphs describe how to design ACT8847 with the S5PC210/S5PV310 processors.

While the ACT8847 supports many possible configurations for powering these processors, one of the most common configurations is detailed in this datasheet. In general, this document refers to the ACT8847 pin names and functions. However, in

cases where the description of interconnections between these devices benefits by doing so, both the ACT8847 pin names and the S5PC210/S5PV310 processors pin names are provided. When this is done, the S5PC210/S5PV310 pin names are located after the ACT8847 pin names, and are italicized and located inside parentheses. For example, PWREN (*XPWRRGTON*) refers to the logic signal applied to the ACT8847's PWREN input, identifying that it is driven from the S5PC210's XPWRRGTON output.

Table 1:

ACT8847 and Samsung S5PC210 Power Domains

| ACT8847 REG-ULATOR | POWER DOMAIN | DEFAULT VOLTAGE | MAX CURRENT | POWER UP ORDER | ON/OFF @ SLEEP | TYPE |
|--------------------|-----------------------|-----------------|-------------|----------------|----------------|-----------------------|
| REG1 | VDD_MEM, VDD12_SLP_ON | 1.2V | 1.5A | 7 | ON | DC/DC Step Down |
| REG2 | VDD_ARM | 1.2V | 2.8A | 3 | OFF | DC/DC Step Down |
| REG3 | VDD_G3D | 1.1V | 2.8A | 4 | OFF | DC/DC Step Down |
| REG4 | VDD_INT | 1.1V | 1.5A | 2 | OFF | DC/DC Step Down |
| REG5 | VDD_PLL | 1.1V | 150mA | 5 | OFF | Low-Noise LDO |
| REG6 | VDD_ALIVE | 1.1V | 150mA | 1 | ON | Low-Noise LDO |
| REG7 | VDD33_SLP_ON | 3.3V | 350mA | 6 | ON | Low-Noise LDO |
| REG8 | VDD18_SLP_OFF | 1.8V | 350mA | 11 | OFF | Low-Noise LDO |
| REG9 | VDD33_SLP_OFF | 3.3V | 350mA | 12 | OFF | Low-Noise LDO |
| REG10 | VDD12_SLP_OFF | 1.2V | 150mA | 10 | OFF | Low Input-Voltage LDO |
| REG11 | VDD11_SLP_OFF | 1.1V | 350mA | 9 | OFF | Low Input-Voltage LDO |
| REG12 | VDD18_SLP_ON | 1.8V | 350mA | 8 | ON | Low Input-Voltage LDO |
| REG13 | VDD_RTC | 1.8V | 50mA | 0 | ON | Always-ON LDO |

Table 2:

ACT8847 and Samsung S5PC210 Power Mode

| Power Mode | Control State | Power Domain State | Quiescent Current |
|------------|---|--|-------------------|
| ALL ON | PWRHLD is asserted, PWREN is asserted | All Regulators ON | 0.6mA |
| SLEEP | PWRHLD is asserted, PWREN is de-asserted | REG1/6/7/12/13 are ON, all other regulators are off. | 200µA |
| SHUTDOWN | PWRHLD is de-asserted, PWREN is de-asserted, VINL2 > 2.6V | REG13 is ON, all other regulators are off. | 10µA |
| ALL OFF | PWRHLD is de-asserted, PWREN is de-asserted, VINL2 < 2.2V | All regulators off. | 5µA |

Table 3:
ACT8847 and S5PC210 Signal Interface[Ⓢ]

| ACT8847 | DIRECTION | SAMSUNG S5PC210 |

Control Signals

Enable Inputs

The ACT8847 features a variety of control inputs, which are used to enable and disable outputs depending upon the desired mode of operation. PWREN, PWRHLD are logic inputs, while nPBIN is a unique, multi-function input.

nPBIN Multi-Function Input

The ACT8847 features the nPBIN multi-function pin, which combines system enable/disable control with a hardware reset function. Select either of the two pin functions by asserting this pin, either through a direct connection to GA, or through a 50kΩ resistor to GA, as shown in Figure 2.

Manual Reset Function

The second major function of the nPBIN input is to provide a manual-reset input for the processor. To manually-reset the processor, drive nPBIN directly to GA through a low impedance (less than 2.5kΩ). An internal timer detects the duration of the MR event:

Short Press / Soft-Reset:

If the MR is asserted for less than 4s, ACT8847 commences a soft-reset operation where nRSTO immediately asserts low, then remains asserted low until the nPBIN input is de-asserted and the reset time-out period expires. A status bit, SRSTAT[], is set after a soft-reset event. The SRSTAT[] bit is automatically cleared to 0 after read. After Short Press, set WDSREN[] to 1 about 1s after nRSTO de-assert then clear WDSREN[] for properly shutdown sequence.

Long Press / Power-cycle:

If the MR is asserted for more than 4s, ACT8847 commences a power cycle routine in which case all regulators are turned off and then turned back on. A status bit, PCSTAT[], is set after the power cycle. The PCSTAT[] bit is automatically cleared to 0 after read.

nPBSTAT Output

nPBSTAT is an open-drain output that reflects the state of the nPBIN input; nPBSTAT is asserted low whenever nPBIN is asserted, and is high-Z otherwise. This output is typically used as an interrupt signal to the processor, to initiate a software-programmable routine such as operating mode selection or to open a menu. Connect nPBSTAT to an appropriate supply voltage through a 10kΩ or greater resistor.

Figure 2:
nPBIN Input

nRSTO Output

nRSTO is an open-drain output which asserts low upon startup or when manual reset is asserted via the nPBIN input. When asserted on startup, nRSTO remains low until reset time-out period expires. When asserted due to manual-reset, nRSTO immediately asserts low, then remains asserted low until the nPBIN input is de-asserted and the reset time-out period expires.

Connect a 10kΩ or greater pull-up resistor from nRSTO to an appropriate voltage supply.

nIRQ Output

nIRQ is an open-drain output that asserts low any time an interrupt is generated. Connect a 10kΩ or greater pull-up resistor from nIRQ to an appropriate voltage supply. nIRQ is typically used to drive the interrupt input of the system processor.

Many of the ACT8847's functions support interrupt-generation as a result of various conditions. These are typically masked by default, but may be unmasked via the I²C interface. For more information about the available fault conditions, refer to the appropriate sections of this datasheet.

Push-Button Control

The ACT8847 is designed to initiate a system enable sequence when the nPBIN multi-function input is asserted. Once this occurs, a power-on sequence commences, as described below. The power-on sequence must complete and the microprocessor must take control (by asserting PWRHLD) before nPBIN is de-asserted. If the microprocessor is unable to complete its power-up routine successfully before the user releases the push-button, the ACT8847 automatically shuts the system down. This provides protection against accidental or momentary assertions of the push-button. If desired, longer "push-and-hold" times can be implemented by simply adding an additional time delay before asserting PWREN or PWRHLD.

Control Sequences

The ACT8847 features a variety of control sequences that are optimized for supporting system enable and disable, as well as SLEEP mode of the Samsung S5PC210 / S5PV310 processors.

Enabling/Disabling Sequence

A typical enable sequence is initiated whenever the nPBIN is asserted low via 50KΩ resistance. The power control diagram is shown in Figure 3. During the boot sequence, the microprocessor must assert PWRHLD (*XPSHOLD*), and PWREN (*XPWRRGTON*), to ensure that the system remains powered after nPBIN is released. Once the power-

up routine is completed, the system remains enabled after the push-button is released as long as PWRHLD is asserted high. If the processor does not assert PWRHLD before the user releases the push-button, the boot-up sequence is terminated and all regulators are disabled. This provides protection against "false-enable", when the push-button is accidentally depressed, and also ensures that the system remains enabled only if the processor successfully completes the boot-up sequence.

As with the enable sequence, a typical disable sequence is initiated when the user presses the push-button, which interrupts the processor via the nPBSTAT output. The actual disable sequence is completely software-controlled, but typically involved initiating various "clean-up" processes before the processor finally de-asserts PWRHLD.

SLEEP Mode Sequence

The ACT8847 supports S5PC210 / S5PV310 processors' SLEEP mode operation. Once a successful power-up routine has been completed, SLEEP mode may be initiated through a variety of software-controlled mechanisms.

SLEEP mode is typically initiated when the user presses the push-button during normal operation. Pressing the push-button asserts the nPBIN input, which asserts the nPBSTAT output, which interrupts the processor. In response to this interrupt the processor should de-assert PWREN(*XPWRRGTON*), disabling REG2/3/4/5/8/9/10/11. PWRHLD should remain asserted during SLEEP mode so that REG1/6/7/12 remain enabled.

The ACT8847 wakes up from SLEEP mode when either the push-button and/or PWREN (*XPWRRGTON*) is asserted. In either case, REG2/3/4/5/8/9/10/11 are enable which allow the system to resume normal operation.

Watch-Dog Supervision

The ACT8847 features a watchdog supervisory function. An internal watchdog timer of 4s is unmasked by setting either WDSREN[] or WDPCEN [] bit to one. Once enabled, the watchdog timer is reset whenever there is I2C activity for the PMU. In the case where the system software stops responding and that there is no I2C transactions for 4s, the watchdog timer expires. As a result, the PMU either perform a soft-reset or power cycle, depending on whether WDSREN [] or WDPCEN [] is set.

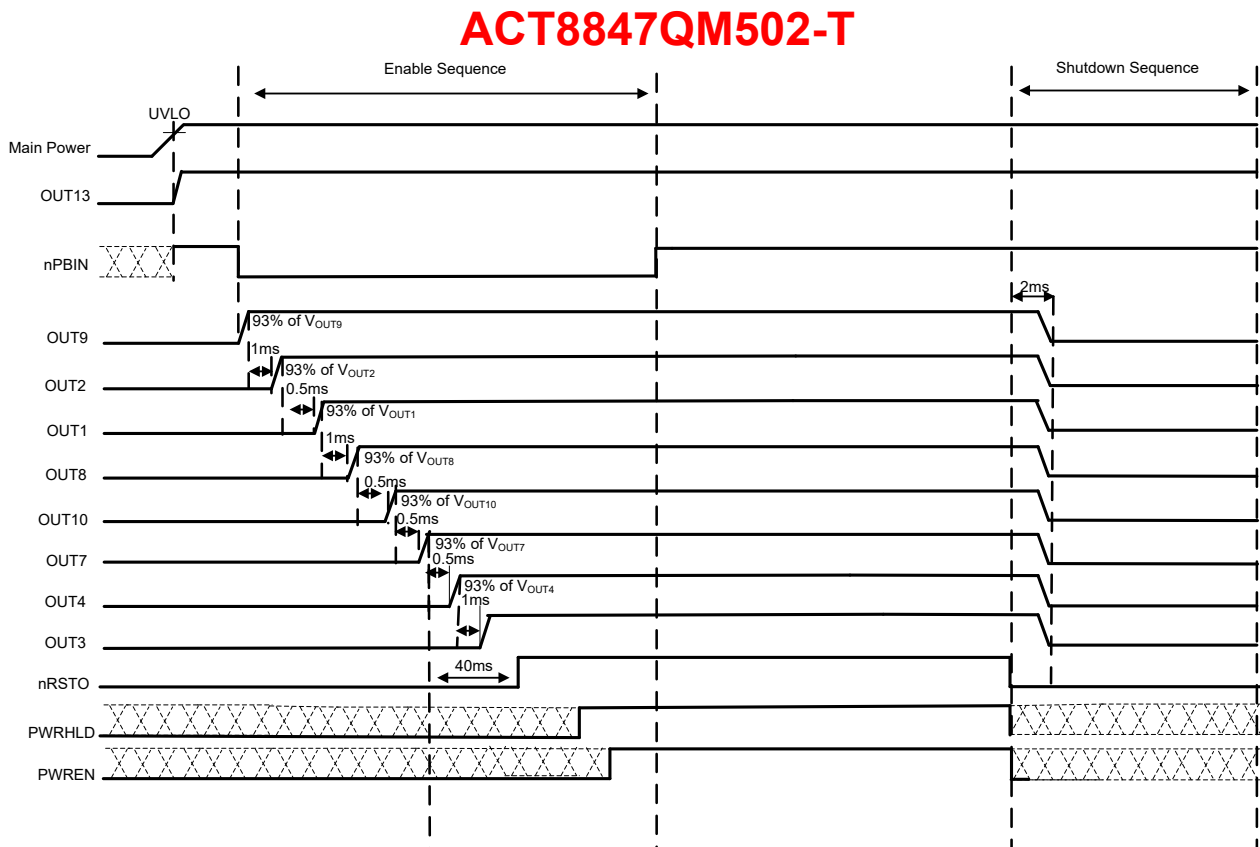

ACT8847 supports software-initiated power cycle. Once the SIPC[] bit is set, the PMU waits for 8ms and then initiate a power cycle to restart the entire system.

Software-Initiated Power Cycle

Figure 3:
Power Control Sequence

Figure 4:
ACT8847QM502-T Power Control Sequence for Freescale i.MX6 Platform.

Keep disable for REG5, REG6, REG11 and REG12, AP can turn on them through I2C if need.

FUNCTIONAL DESCRIPTION

I²C Interface

The ACT8847 features an I²C interface that allows advanced programming capability to enhance overall system performance. To ensure compatibility with a wide range of system processors, the I²C interface supports clock speeds of up to 400kHz (“Fast-Mode” operation) and uses standard I²C commands. I²C write-byte commands are used to program the ACT8847, and I²C read-byte commands are used to read the ACT8847’s internal registers. The ACT8847 always operates as a slave device, and is addressed using a 7-bit slave address followed by an eighth bit, which indicates whether the transaction is a read-operation or a write-operation, [1011010x].

SDA is a bi-directional data line and SCL is a clock input. The master device initiates a transaction by issuing a START condition, defined by SDA transitioning from high to low while SCL is high. Data is transferred in 8-bit packets, beginning with the MSB, and is clocked-in on the rising edge of SCL. Each packet of data is followed by an “Acknowledge” (ACK) bit, used to confirm that the data was transmitted successfully.

For more information regarding the I²C 2-wire serial interface, go to the NXP website: <http://www.nxp.com>.

Housekeeping Functions

Programmable battery Voltage Monitor

The ACT8847 features a programmable battery-voltage monitor, which monitors the voltage at INL2 (which should be connected directly to the battery) and compares it to a programmable threshold voltage. The VBATMON comparator is designed to be immune to noise resulting from switching, load transients, etc. The BATMON comparator is disable by default; to enable it, set the BATLEV[3:0] register to one of the value in Table 4. Note that there is a 200mV hysteresis between the rising and falling threshold for the comparator. The VBATDAT [] bit reflects the output of the BATMON comparator. The value of VBATDAT[] is 1 when $V_{INL2} < BATLEV$; value is 0 otherwise.

The VBATMON comparator can generate an interrupt when V_{INL2} is lower than BATLEV[] voltage. The interrupt is masked by default by can be unmasked by setting VBATMSK[] = 1.

Thermal Protection

| BATLEV[3:0] | BATLEV Falling Threshold |
|-------------|--------------------------|
| 0000 | 2.5 |
| 0001 | 2.6 |
| 0010 | 2.7 |
| 0011 | 2.8 |
| 0100 | 2.9 |
| 0101 | 3.0 |
| 0110 | 3.1 |
| 0111 | 3.2 |
| 1000 | 3.3 |
| 1001 | 3.4 |
| 1010 | 3.5 |
| 1011 | 3.6 |
| 1100 | 3.7 |
| 1101 | 3.8 |
| 1110 | 3.9 |
| 1111 | 4.0 |

The ACT8847 integrates thermal shutdown protection circuitry to prevent damage resulting from excessive thermal stress, as may be encountered under fault conditions.

Thermal Interrupt

If the thermal interrupt is unmasked (by setting nTMSK[] to 1), ACT8847 can generate an interrupt when the die temperature reaches 120°C (typ).

Thermal Protection

If the ACT8847 die temperature exceeds 160°C, the thermal protection circuitry disables all regulators and prevents the regulators from being enabled until the IC temperature drops by 20°C (typ).

Table 4:
BATLEV Falling Threshold

STEP-DOWN DC/DC REGULATORS

General Description

REG1, REG2, REG3, and REG4 are fixed-frequency, current-mode, synchronous PWM step-down converters that achieves peak efficiencies of up to 97%. These regulators operate with a fixed frequency of 2.25MHz, minimizing noise in sensitive applications and allowing the use of small external components. Additionally, REG1, REG2, REG3, and REG4 are available with a variety of standard and custom output voltages, and may be software-controlled via the I²C interface for systems that require advanced power management functions.

100% Duty Cycle Operation

REG1, REG2, REG3, and REG4 are capable of operating at up to 100% duty cycle. During 100% duty cycle operation, the high-side power MOSFETs are held on continuously, providing a direct connection from the input to the output (through the inductor), ensuring the lowest possible dropout voltage in battery powered applications.

Operating Mode

By default, REG1, REG2, REG3, and REG4 operate in fixed-frequency PWM mode at medium to heavy loads, then transition to a proprietary power-saving mode at light loads in order to save power.

Synchronous Rectification

REG1, REG2, REG3, and REG4 each feature integrated synchronous rectifiers, maximizing efficiency and minimizing the total solution size and cost by eliminating the need for external rectifiers.

Soft-Start

REG1, REG2, REG3, and REG4 include internal 400 us soft-start ramps which limit the rate of change of the output voltage, minimizing input inrush current and ensuring that the output powers up in a monotonic manner that is independent of loading on the outputs. This circuitry is effective any time the regulator is enabled, as well as after responding to a short-circuit or other fault condition.

Compensation

REG1, REG2, REG3, and REG4 utilize current-mode control and a proprietary internal compensation scheme to simultaneously simplify external component selection and optimize transient performance over their full operating range. No compensation design is required; simply follow a few simple guide lines described below when choosing external components.

Input Capacitor Selection

The input capacitor reduces peak currents and noise

induced upon the voltage source. A 10μF ceramic capacitor is recommended for each regulator in most applications.

Output Capacitor Selection

REG1, REG2, REG3, and REG4 were designed to take advantage of the benefits of ceramic capacitors, namely small size and very-low ESR. REG1, REG2, REG3 and REG4 are designed to operate with 33μF or 44μF output capacitor over most of their output voltage ranges, although more capacitance may be desired depending on the duty cycle and load step requirements.

Two of the most common dielectrics are Y5V and X5R. Whereas Y5V dielectrics are inexpensive and can provide high capacitance in small packages, their capacitance varies greatly over their voltage and temperature ranges and are not recommended for DC/DC applications. X5R and X7R dielectrics are more suitable for output capacitor applications, as their characteristics are more stable over their operating ranges, and are highly recommended.

Inductor Selection

REG1, REG2, REG3, and REG4 utilize current-mode control and a proprietary internal compensation scheme to simultaneously simplify external component selection and optimize transient performance over their full operating range. These devices were optimized for operation with 2.2μH or 1μH inductors. Choose an inductor with a low DC-resistance, and avoid inductor saturation by choosing inductors with DC ratings that exceed the maximum output current by at least 30%.

Configuration Options

Output Voltage Programming

By default, each regulator powers up and regulates to its default output voltage. For REG2, REG3 and REG4, the output voltage is selectable by setting corresponding VSEL pin that when VSEL is low, output voltage is programmed by VSET0[] bits, and when VSEL is high, output voltage is programmed by VSET1[] bits. Also, once the system is enabled, each regulator's output voltage may be independently programmed to a different value. Program the output voltages via the I²C serial interface by writing to the regulator's VSET0[] register if VSEL is low or VSET1[] register if VSEL is high as shown in Table 5.

Enable / Disable Control

During normal operation, each buck may be enabled or disabled via the I²C interface by writing to that regulator's ON[] bit.

OK[] and Output Fault Interrupt

Each DC/DC features a power-OK status bit that can be read by the system microprocessor via the I²C interface. If an output voltage is lower than the power-OK threshold, typically 7% below the programmed regulation voltage, that regulator's OK[] bit will be 0.

If a DC/DC's nFLTMSK[] bit is set to 1, the ACT8847 will interrupt the processor if that DC/DC's output voltage falls below the power-OK threshold. In this case, nIRQ will assert low and remain asserted until either the regulator is turned off or back in regulation, and the OK[] bit has been read via I²C.

PCB Layout Considerations

High switching frequencies and large peak currents make PC board layout an important part of step-down DC/DC converter design. A good design minimizes excessive EMI on the feedback paths and voltage gradients in the ground plane, both of which can result in instability or regulation errors.

Step-down DC/DCs exhibit discontinuous input current, so the input capacitors should be placed as close as possible to the IC, and avoiding the use of via if possible. The inductor, input filter capacitor, and output filter capacitor should be connected as close together as possible, with short, direct, and wide traces. The ground nodes for each regulator's power loop should be connected at a single point in a star-ground configuration, and this point should be connected to the backside ground plane with multiple via. The output node for each regulator should be connected to its corresponding OUTx pin through the shortest possible route, while keeping sufficient distance from switching nodes to prevent noise injection. Finally, the exposed pad should be directly connected to the backside ground plane using multiple via to achieve low electrical and thermal resistance.

Table 5:
REGx/VSET[] Output Voltage Setting

| REGx/VSET[2:0] | REGx/VSET[5:3] | | | | | | | |
|----------------|----------------|-------|-------|-------|-------|-------|-------|-------|
| | 000 | 001 | 010 | 011 | 100 | 101 | 110 | 111 |
| 000 | 0.600 | 0.800 | 1.000 | 1.200 | 1.600 | 2.000 | 2.400 | 3.200 |
| 001 | 0.625 | 0.825 | 1.025 | 1.250 | 1.650 | 2.050 | 2.500 | 3.300 |
| 010 | 0.650 | 0.850 | 1.050 | 1.300 | 1.700 | 2.100 | 2.600 | 3.400 |
| 011 | 0.675 | 0.875 | 1.075 | 1.350 | 1.750 | 2.150 | 2.700 | 3.500 |

| 110 | 0.750 | 0.950 | 1.150 | 1.500 | 1.900 | 2.300 | 3.000 | 3.800 |
| 111 | 0.775 | 0.975 | 1.175 | 1.550 | 1.950 | 2.350 | 3.100 | 3.900 |

LOW-NOISE, LOW-DROPOUT LINEAR REGULATORS

General Description

ACT8847 features eight low-noise, low-dropout linear regulators (LDOs) that supply up to 350mA. Three of these LDOs (REG10, REG11, and REG12) supports extended input voltage range down to 1.7V. Each LDO has been optimized to achieve low noise and high-PSRR.

Output Current Limit

Each LDO contains current-limit circuitry featuring a current-limit fold-back function. During normal and moderate overload conditions, the regulators can support more than their rated output currents. During extreme overload conditions, however, the current limit is reduced by approximately 30%, reducing power dissipation within the IC.

Compensation

The LDOs are internally compensated and require very little design effort, simply select input and output capacitors according to the guidelines below.

Input Capacitor Selection

Each LDO requires a small ceramic input capacitor to supply current to support fast transients at the input of the LDO. Bypassing each INL pin to GA with 1 μ F. High quality ceramic capacitors such as X7R and X5R dielectric types are strongly recommended.

Output Capacitor Selection

Each LDO requires a small 2.2 μ F ceramic output capacitor for stability. For best performance, each output capacitor should be connected directly between the output and GA pins, as close to the output as possible, and with a short, direct connection. High quality ceramic capacitors such as X7R and X5R dielectric types are strongly recommended.

Configuration Options

Output Voltage Programming

By default, each LDO powers up and regulates to its default output voltage. Once the system is enabled, each output voltage may be independently programmed to a different value by writing to the regulator's VSET[] register via the I²C serial interface as shown in Table 5.

Enable / Disable Control

During normal operation, each LDO may be enabled or disabled via the I²C interface by writing to that LDO's ON[] bit.

Output Discharge

Each of the LDOs features an optional output discharge function, which discharges the output to ground through a 1.5k Ω resistance when the LDO is disabled. This feature may be enabled or disabled by setting DIS[]; set DIS[] to 1 to enable this function, clear DIS[] to 0 to disable it.

OK[] and Output Fault Interrupt

Each LDO features a power-OK status bit that can be read by the system microprocessor via the interface. If an output voltage is lower than the power-OK threshold, typically 11% below the programmed regulation voltage, the value of that regulator's OK[] bit will be 0.

If a LDO's nFLTMSK[] bit is set to 1, the ACT8847 will interrupt the processor if that LDO's output voltage falls below the power-OK threshold. In this case, nIRQ will assert low and remain asserted until either the regulator is turned off or back in regulation, and the OK[] bit has been read via I²C.

PCB Layout Considerations

The ACT8847's LDOs provide good DC, AC, and noise performance over a wide range of operating conditions, and are relatively insensitive to layout considerations. When designing a PCB, however, careful layout is necessary to prevent other circuitry from degrading LDO performance.

A good design places input and output capacitors as close to the LDO inputs and output as possible, and utilizes a star-ground configuration for all regulators to prevent noise-coupling through ground. Output traces should be routed to avoid close proximity to noisy nodes, particularly the SW nodes of the DC/DCs.

REFBP is a noise-filtered reference, and internally has a direct connection to the linear regulator controller. Any noise injected onto REFBP will directly affect the outputs of the linear regulators, and therefore special care should be taken to ensure that no noise is injected to the outputs via REFBP. As with the LDO output capacitors, the REFBP bypass capacitor should be placed as close to the IC as possible, with short, direct connections to the star-ground. Avoid the use of via whenever possible. Noisy nodes, such as from the DC/DCs, should be routed as far away from REFBP as possible.

ALWAYS-ON LDO (REG13)

General Description

REG13 is an always-on, low-dropout linear regulator (LDO) that is optimized for RTC and backup-battery applications. REG13 features low-quiescent supply current, current-limit protection, and reverse-current protection, and is ideally suited for always-on power supply applications, such as for a real-time clock, or as a backup-battery or super-cap charger.

Reverse-Current Protection

REG13 features internal circuitry that limits the reverse supply current to less than 1 μ A when the input voltage falls below the output voltage, as can be encountered in backup-battery charging applications. REG13's internal circuitry monitors the input and the output, and disconnects internal circuitry and parasitic diodes when the input voltage falls below the output voltage, greatly minimizing backup battery discharge.

Typical Application

Voltage Regulators

REG13 is ideally suited for always-on voltage-regulation applications, such as for real-time clock and memory keep-alive applications. This regulator requires only a small ceramic capacitor with a minimum capacitance of 0.47 μ F for stability. For best performance, the output capacitor should be connected directly between the output and GA, with a short and direct connection.

Figure 5:

Typical Application of RTC LDO

Backup Battery Charging

REG13 features a constant current-limit, which protects the IC under output short-circuit conditions as well as provides a constant charge current, when operating as a backup battery charger.

PWM LED DRIVERS

The GPIO3, the GPIO4, the GPIO5, and the GPIO6 are configured as PWM LED drivers, which could support up to 6mA current with programmable frequency and duty cycle. Set PWMxEN[] bit to “1” to enable PWM function of GPIOx.

PWM Frequency Selection

Each LED driver may be independently programmed to a different frequency by writing to the GPIO's FRE[2:0] register via the I²C serial interface as shown in Table 6.

Table 6:

GPIOx/FRE[] PWM Frequency Setting

| GPIOx/FRE[2:0] | PWM Frequency [Hz] |
|----------------|--------------------|
| 000 | 0.25 |
| 001 | 0.5 |
| 010 | 1 |
| 011 | 2 |
| 100 | 128 |
| 101 | 256 |

PWM Duty Cycle Selection

Each LED driver may be independently programmed to a different duty cycle by writing to the GPIO's DUTY[3:0] register via the I²C serial interface as shown in Table 7.

GPIOx/DUTY[] PWM Frequency Setting

| GPIOx/DUTY[3:0] | PWM Duty Cycle [%] |
|-----------------|--------------------|
| 0000 | 6.25 |
| 0001 | 12.5 |
| 0010 | 18.75 |
| 0011 | 25 |
| 0100 | 31.25 |
| 0101 | 37.5 |
| 0110 | 43.75 |
| 0111 | 50 |
| 1000 | 56.25 |
| 1001 | 62.5 |
| 1010 | 68.75 |
| 1011 | 75 |
| 1100 | 81.25 |
| 1101 | 87.5 |
| 1110 | 93.75 |
| 1111 | 100 |

Table 7:

CMI OPTIONS

This section provides the basic default configuration settings for the ACT8847 CMI options. Refer to each option's application note for the comprehensive list of default settings.

CMI 102: ACT8847QM102-T

CMI 102 is optimized for iMX6UL/iMX6ULL processors. REG6, REG8, REG9, REG10, REG11, and REG12 are not enabled by default with this CMI, but can be enabled via I2C. Typical connections to the iMX6UL are shown below.

| ACT8846 Regulator | Voltage | iMX6UL Function | iMX6UL Pins |
|-------------------|---------|--------------------------------------|-------------|
| REG1 | 1.35V | DDR3L Supply | NVCC_DRAM |
| REG2 | 3.3V | GPIO Supplies | NVCC_XXXX |
| REG3 | 3.8V | System Supply | n/a |
| REG4 | 1.3V | Core Supply | VDD_SOC_IN |
| REG5 | 3.3V | System Supply for startup sequencing | n/a |
| REG7 | 3.3V | VDD High Supply | VDD_HIGH_IN |
| REG13 | 3.3V | Secure NVM Storage Supply | VDD_SNVS_IN |

Sequencing

| Rail | VSET0 Voltage (V) | VSET1 Voltage (V) | Sequencing Input Trigger | StartUp Delay (us) | Soft-Start (us) |
|-------|-------------------|-------------------|--------------------------|--------------------|-----------------|
| VIN | 5 | 5 | n/a | n/a | n/a |
| REG13 | 3.3 | 3.3 | VIN_UVLO | 400 | 400 |
| REG7 | 3.3 | 3.3 | GPIO1 | 32000 | 100 |
| REG1 | 1.35 | 1.35 | OUT7 | 2000 | 400 |
| REG4 | 1.3 | 1.3 | OUT1 | 2000 | 400 |
| REG2 | 3.3 | 3.3 | OUT4 | 2000 | 400 |
| REG5 | 3.3 | 3.3 | OUT2 | 0 | 100 |
| REG3 | 3.8 | 3.8 | PWREN AND PWRHLD | 2000 | 400 |
| REG6 | off | off | n/a | n/a | n/a |
| REG8 | off | off | n/a | n/a | n/a |
| REG9 | off | off | n/a | n/a | n/a |
| REG10 | off | off | n/a | n/a | n/a |
| REG11 | off | off | n/a | n/a | n/a |
| REG12 | off | off | n/a | n/a | n/a |

Hardware Configuration

The following hardware connections are required to achieve the specified startup sequencing.

Connect a 2.2uF capacitor between GPIO1 and GPIO2

Connect a 1Mohm resistor from GPIO2 to GA.

Connect a 51kohm resistor between GPIO3 and nPBIN.

Connect a 10kohm resistor between REG7 and PWRHLD.

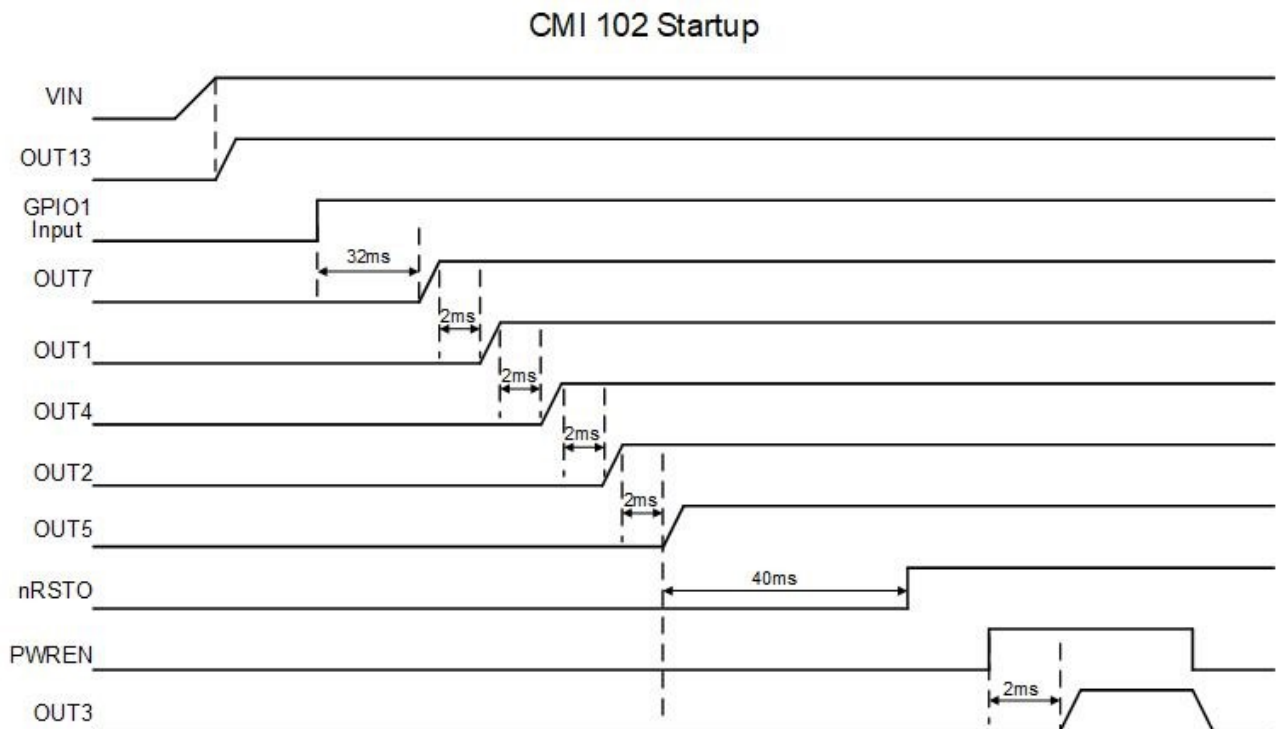

Startup

The ACT8847QM102-T has three startup sequences.

REG13. When power is applied to the IC. REG13 automatically turns on when input power is applied and the input voltage is above UVLO.

REG7/1/4/2/5. REG7/1/4/2/5 turn on when GPIO1 is pulled high. REG7/1/4/2/5 are latched on after REG7 goes into regulation and pulls PWRHLD high. GPIO1 may remain high or return to a logic low after this time. REG7/1/4/2/5 stay on in either case.

REG3. The enable input for REG3 is the AND of PWRHLD and PWREN. Note that PWRHLD should be connected to REG7. REG3 is intended to be turned on after REG7/1/4/2/5 are in regulation. Once REG7/1/4/2/5 are in regulation and PWRHLD is high, REG3 can be independently enabled and disabled with PWREN.

Shutdown

REG3 shuts down when either PWREN or PWRHLD go low. REG7/1/4/2/5 shut down by pressing nPBIN for longer than 4s or by pulling PWRHLD low while GPIO1 is low.

nPBIN

nPBIN retains the short and long press functionality described earlier in the datasheet. A “short press” pulls nRSTO low to reset the processor. A “long press” powers down all outputs. The outputs restart per the defined sequencing when nPBIN is released after a “long press”

NRSTO

nRSTO is gated by REG5 and should be pulled up to REG5. nRSTO has a 40ms delay after REG5 goes into regulation.

CMI 103

CMI 103 is optimized for iMX6UL/iMX6ULL processors. REG6, REG10, REG11, and REG12 are not enabled by default with this CMI, but can be enabled via I2C. CMI 103 is similar to CMI 102. The difference is that CMI 103 has REG8 and REG9 enabled by default and that the turn-on delays are 1ms instead of 2ms. Typical connections to the iMX6UL are shown below. REG8 and REG9 power additional non-iMX6UL circuitry.

| ACT8846 Regulator | Voltage | iMX6UL Function | iMX6UL Pins |
|-------------------|---------|--------------------------------------|-------------|
| REG1 | 1.35V | DDR3L Supply | NVCC_DRAM |
| REG2 | 3.3V | GPIO Supplies | NVCC_xxxx |
| REG3 | 3.8V | System Supply | n/a |
| REG4 | 1.3V | Core Supply | VDD_SOC_IN |
| REG5 | 3.3V | System Supply for startup sequencing | n/a |
| REG7 | 3.3V | VDD High Supply | VDD_HIGH_IN |
| REG8 | 3.3V | External circuitry | n/a |
| REG9 | 3.1V | External circuitry | n/a |
| REG13 | 3.3V | Secure NVM Storage Supply | VDD_SNVS_IN |

Sequencing

| Rail | VSET0 Voltage (V) | VSET1 Voltage (V) | Sequencing Input Trigger | StartUp Delay (us) | Soft-Start (us) |
|-------|-------------------|-------------------|--------------------------|--------------------|-----------------|
| VIN | 5 | 5 | n/a | n/a | n/a |
| REG13 | 3.3 | 3.3 | VIN_UVLO | 400 | 400 |
| REG7 | 3.3 | 3.3 | GPIO1 | 32000 | 100 |
| REG1 | 1.35 | 1.35 | OUT7 | 1000 | 400 |
| REG4 | 1.3 | 1.3 | OUT1 | 1000 | 400 |
| REG2 | 3.3 | 3.3 | OUT4 | 1000 | 400 |
| REG5 | 3.3 | 3.3 | OUT2 | 0 | 100 |
| REG8 | 3.3 | n/a | OUT5 | 1000 | 100 |
| REG9 | 3.1 | n/a | OUT3 | 1000 | 100 |
| REG3 | 3.8 | 3.8 | PWREN AND PWRHLD | 2000 | 400 |
| REG6 | off | n/a | n/a | n/a | n/a |
| REG10 | off | n/a | n/a | n/a | n/a |
| REG11 | off | n/a | n/a | n/a | n/a |
| REG12 | off | n/a | n/a | n/a | n/a |

Hardware Configuration

The following hardware connections are required to achieve the specified startup sequencing.

Connect a 2.2uF capacitor between GPIO1 and GPIO2

Connect a 1Mohm resistor from GPIO2 to GA.

Connect a 51kohm resistor between GPIO3 and nPBIN.

Connect a 10kohm resistor between REG7 and PWRHLD.

Startup

The ACT8847QM103-T has three startup sequences.

REG13. When power is applied to the IC. REG13 automatically turns on when input power is applied and the input voltage is above UVLO.

REG7/1/4/2/5/8/9. REG7/1/4/2/5 turn on when GPIO1 is pulled high. REG7/1/4/2/5/8/9 are latched on after REG7 goes into regulation and pulls PWRHLD high. GPIO1 may remain high or return to a logic low after this time. REG7/1/4/2/5/8/9 stay on in either case.

REG3. The enable input for REG3 is the AND of PWRHLD and PWREN. Note that PWRHLD should be connected to REG7. REG3 is intended to be turned on after REG7/1/4/2/5/8/9 are in regulation. Once REG7/1/4/2/5/8/9 are in regulation and PWRHLD is high, REG3 can be independently ena-
