Principles

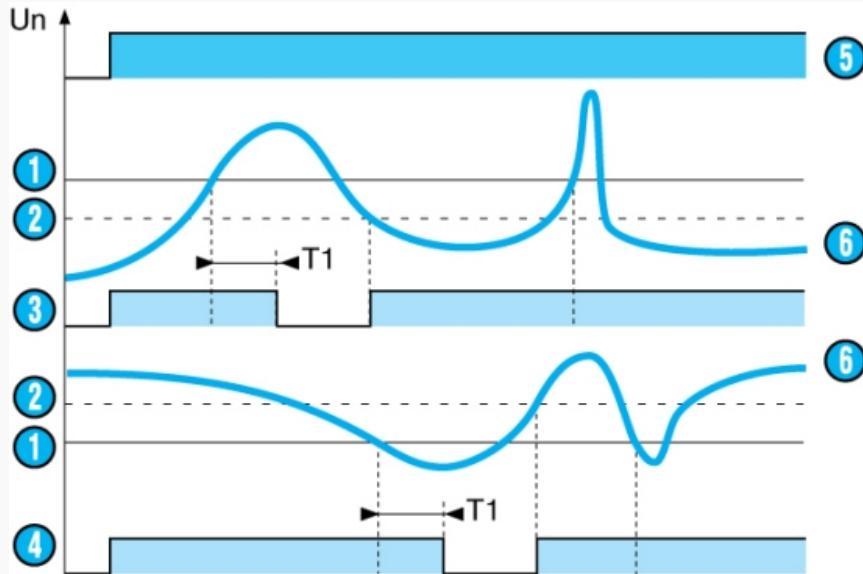

When the value of the controlled voltage, AC or DC, reaches the threshold U_e displayed on the front face, the output relay changes state at the end of a time delay T_1 , which can be set on the front face at between 0.1 and 3s.

Once the voltage drops below 5 to 50 % of the threshold (hysteresis), the output relay changes state again instantly. Changing the hysteresis on the front face does not therefore modify the value of the preset threshold.
