

FEATURES

Pin-compatible with MAX1232 and Dallas DS1232
Adjustable precision voltage monitor with 4.5 V and 4.75 V options
Adjustable strobe monitor with 150 ms, 600 ms, or 1.2 sec options
No external components
Specified from -40°C to +85°C

APPLICATIONS

Microprocessor systems
Portable equipment
Computers
Controllers
Intelligent instruments
Automotive systems

GENERAL DESCRIPTION

The ADM1232 is pin-compatible with the MAX1232, DS1232LP, and DS1232. The Analog Devices, Inc., ADM1232 is a microprocessor monitoring circuit that can monitor the following:

- Microprocessor supply voltage
- Whether a microprocessor has locked up
- External interrupts

The ADM1232 is available in four packages: an 8-lead MSOP (RM-8), an 8-lead PDIP (N-8), a 16-lead wide SOIC (RW-16), and an 8-lead narrow SOIC (R-8).

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ unless otherwise noted.

Table 2.

Parameter	Rating
V_{CC}	5.5 V
Logic Inputs	-0.3 V to $V_{CC} + 0.3$ V
Storage Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C
Power Dissipation	
N-8 ¹	1000 mW
RW-16, RM-8 ²	900 mW
R-8 ²	900 μW

¹ Derate by 13.5 mW/°C above 25°C.

² Derate by 12 mW/°C above 25°C.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 3. Thermal Resistance

Package Type	θ_{JA}	Unit
8-Lead PDIP (N-8)	100	°C/W
16-Lead SOIC_W (RW-16)	73	°C/W
8-Lead MSOP (RM-8)	206	°C/W
8-Lead SOIC_N (R-8)	153	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 4. Pin Function Descriptions

Pin No.		Mnemonic	Description
RW-16	N-8, R-8, RM-8		
1, 3, 5, 7, 10, 12, 14, 16		NC	No Connection.
2	1	PB RESET	Push-Button Reset Input. This debounced input ignores pulses of less than 1 ms and is guaranteed to respond to pulses greater than 20 ms.
4	2	TD	Time Delay Set. This input allows the user to select the maximum amount of time that the ADM1232 allows the STROBE input to remain inactive—that is, STROBE is not receiving any high-to-low transitions—without forcing the ADM1232 to generate a RESET pulse. See the Specifications section, Figure 8, and the STROBE Timeout Selection section.
6	3	TOLERANCE	Tolerance Input. This input determines how much the supply voltage is allowed to decrease (as a percentage) before a RESET is asserted. Connect this pin to V _{CC} for 10% and to GND for 5%.
8	4	GND	0 V Ground Reference for All Signals.
9	5	RESET	Active High Logic Output. This pin is asserted when any of the following events occurs: V _{CC} decreases below the amount specified by the TOLERANCE input; when PB RESET is forced low; if there are no high-to-low transitions within the limits set by TD at STROBE; and during power-up.
11	6	RESET	Inverse of RESET. This pin has an open-drain output.
13	7	STROBE	The STROBE input is used to monitor the activity of a microprocessor. If there are no high-to-low transitions within the time specified by TD, a reset is asserted.
15	8	V _{CC}	Power Supply Input, 5 V.

CIRCUIT INFORMATION

PB RESET

The PB RESET input makes it possible to manually reset a system using either a standard push-button switch or a logic low input. An internal debounce circuit provides glitch immunity when used with a switch, reducing the effects of glitches on the line. The debounce circuit is guaranteed to cause the ADM1232 to assert a reset if PB RESET is brought low for more than 20 ms and is guaranteed to ignore low inputs of less than 1 ms.

Figure 6. Typical Push-Button Reset Application

Figure 7. PB RESET

STROBE TIMEOUT SELECTION

TD (time delay) set is used to set the strobe timeout period. The strobe timeout period is the maximum time between high-to-low transitions that STROBE accepts before a reset is asserted (see Figure 8). The strobe timeout settings are listed in Table 5.

Table 5. Strobe Timeout Settings

Condition	Min	Typ	Max	Unit
TD = 0 V	62.5	150	250	ms
TD = Floating	250	600	1000	ms
TD = V _{CC}	500	1200	2000	ms

Figure 8. STROBE Parameters

Figure 9. Reset Output Delay

TOLERANCE

The TOLERANCE input is used to determine the level at which V_{CC} can vary below 5 V without the ADM1232 asserting a reset. Connecting TOLERANCE to GND selects a -5% tolerance level and causes the ADM1232 to generate a reset if V_{CC} falls below 4.75 V. If TOLERANCE is connected to V_{CC}, a -10% tolerance level is selected, which causes the ADM1232 to generate a reset if V_{CC} falls below 4.5 V. See the parameters for the V_{CC} trip point in the Specifications section for more information.

RESET AND RESET OUTPUTS

RESET is capable of sourcing and sinking current, whereas RESET is an open-drain MOSFET that sinks current only. Therefore, it is necessary to pull this output high.
