**AUTOMOTIVE GRADE PRECISION HIGH VOLTAGE HIGH-SIDE CURRENT MONITORS**

**Description**

The ZXCT1082Q/83Q/84Q/85Q/86Q/87Q are high side unipolar current sense monitors. These devices eliminate the need to disrupt the ground plane when sensing a load current.

The ZXCT1082Q/1084Q/1086Q have 60V maximum operating voltages and ZXCT1083Q/1085Q/1087Q have 40V maximum operating voltages.

The wide common-mode input voltage range and low quiescent currents coupled with SOT25 packages make them suitable for a range of applications; including automotive and systems operating from industrial 24-28V rails.

Their quiescent current is only 0.6µA thereby minimizing current sensing error.

The ZXCT1082Q and ZXCT1083Q use three external transconductance/gain setting resistors which increase versatility by permitting wide gain ranges and optimization of bandwidths.

The ZXCT1084Q/85Q/86Q/87Q are fixed gain voltage output counterparts of the ZXCT1082Q/83.

The ZXCT1082Q/3Q/4Q/5Q/6Q/7Q have been qualified to AEC-Q100 Grade 1 and are Automotive Grade supporting PPAPs.

- For the ZXCT1082/83  $V_{\text{SENSE}} = "V_{\text{SUPPLY}}" - "V_{\text{LOAD}}"$  where  $V_{\text{LOAD}}$  is the load voltage or the lower potential side of the sense resistor. For the ZXCT1083/84/85/86  $V_{\text{SENSE}} = "V_{S+}" - "V_{S-}"$
  - $V_{IO}$  is extrapolated from measurements for the gain-error test.
  - For  $V_{\text{SENSE}} > 10\text{mV}$ , the internal voltage-current converter is fully linear. This enables a true offset to be defined and used.
  - Gain or transconductance error is calculated by applying two values of  $V_{\text{SENSE}}$  and calculating the error of the slope vs. the ideal.
