

# Integrated Silicon Pressure Sensor On-Chip Signal Conditioned, Temperature Compensated and Calibrated

The MPXV7025 series piezoresistive transducer is a state-of-the-art monolithic silicon pressure sensor designed for a wide range of applications, but particularly those employing a microcontroller or microprocessor with A/D inputs. This patented, single element transducer combines advanced micromachining techniques, thin-film metallization, and bipolar processing to provide an accurate, high level analog output signal that is proportional to the applied pressure.

## Features

- 5.0% Maximum Error Over 0° to 85°C
- Ideally Suited for Microprocessor or Microcontroller-Based Systems
- Temperature Compensated Over -40° to +125°C
- Thermoplastic (PPS) Surface Mount Package
- Patented Silicon Shear Stress Strain Gauge
- Available in Differential and Gauge Configurations

## MPXV7025 Series

-25 to 25 kPa (-3.6 to 3.6 psi)  
 0.2 to 4.7 V Output

## Application Examples

- Respiratory Systems
- Process Control
- Patient Monitoring
- Remote Monitoring Devices

| Full Scale Span <sup>(5)</sup><br>@ $V_S = 5.0$ Volts         | $V_{FSS}$ | —     | 4.5       | —         | Vdc         |
| Accuracy<br>(0 to $85^\circ\text{C}$ )                        | —         | —     | —         | $\pm 5.0$ | % $V_{FSS}$ |
| Sensitivity                                                   | V/P       | —     | 90        | —         | mV/kPa      |
| Response Time <sup>(6)</sup>                                  | $t_R$     | —     | 1.0       | —         | ms          |
| Output Source Current at Full Scale Output                    | $I_{o+}$  | —     | 0.1       | —         | mAdc        |
| Warm-Up Time <sup>(7)</sup>                                   | —         | —     | 20        | —         | ms          |
| Offset Stability <sup>(8)</sup>                               | —         | —     | $\pm 0.5$ | —         | % $V_{FSS}$ |

- 1.0 kPa (kiloPascal) equals 0.145 psi.
- Device is ratiometric within this specified excitation range.
- Offset ( $V_{off}$ ) is defined as the output voltage at the minimum rated pressure.
- Full Scale Output ( $V_{FSO}$ ) is defined as the output voltage at the maximum or full rated pressure.
- Full Scale Span ( $V_{FSS}$ ) is defined as the algebraic difference between the output voltage at full rated pressure and the output voltage at the minimum rated pressure.
- Response Time is defined as the time for the incremental change in the output to go from 10% to 90% of its final value when subjected to a specified step change in pressure.
- Warm-up Time is defined as the time required for the product to meet the specified output voltage after the Pressure has been stabilized.
- Offset Stability is the product's output deviation when subjected to 1000 hours of Pulsed Pressure, Temperature Cycling with Bias Test.

# Maximum Ratings

**Table 2. Maximum Ratings<sup>(1)</sup>**

| Rating                     | Symbol    | Value       | Unit |
|----------------------------|-----------|-------------|------|
| Maximum Pressure (P1 > P2) | $P_{max}$ | 200         | kPa  |
| Storage Temperature        | $T_{stg}$ | -40 to +125 | °C   |
| Operating Temperature      | $T_A$     | -40 to +125 | °C   |

1. Exposure beyond the specified limits may cause permanent damage or degradation to the device.

Figure 1 shows a block diagram of the internal circuitry integrated on a pressure sensor chip.

**Figure 1. Integrated Pressure Sensor Schematic**

## On-chip Temperature Compensation and Calibration

The MPXV7025 series pressure sensor operating characteristics, and internal reliability and qualification tests are based on use of dry air as the pressure media. Media, other than dry air, may have adverse effects on sensor performance and long-term reliability. Contact the factory for information regarding media compatibility in your application.

Figure 2 shows the sensor output signal relative to pressure input. Typical, minimum, and maximum output

curves are shown for operation over a temperature range of 0° to 85°C using the decoupling circuit shown in Figure 3. The output will saturate outside of the specified pressure range.

Figure 3 shows the recommended decoupling circuit for interfacing the output of the integrated sensor to the A/D input of a microprocessor or microcontroller. Proper decoupling of the power supply is recommended.

Figure 2. Output versus Pressure Differential

Figure 3. Recommended Power Supply Decoupling and Output Filtering  
 (For additional output filtering, please refer to Application Note AN1646.)

## Transfer Function

**Nominal Transfer Value:**  $V_{out} = V_S (P \times 0.018 + 0.5)$   
 $\pm (\text{Pressure Error} \times \text{Temp. Factor} \times 0.018 \times V_S)$   
 $V_S = 5.0 \text{ V} \pm 0.25 \text{ Vdc}$

## Temperature Error Band

### MPXV7025 SERIES

NOTE: The Temperature Multiplier is a linear response from 0° to -40°C and from 85° to 125°C.

## Pressure Error Band

## PRESSURE (P1)/VACUUM (P2) SIDE IDENTIFICATION TABLE

Freescall designates the two sides of the pressure sensor as the Pressure (P1) side and the Vacuum (P2) side. The Pressure (P1) side is the side containing fluorosilicone gel which protects the die from harsh media. The pressure

sensor is designed to operate with positive differential pressure applied, P1 > P2.

The Pressure (P1) side may be identified by using the following table:

| Part Number                     | Case Type | Pressure (P1) Side Identifier |
|---------------------------------|-----------|-------------------------------|
| MPXV7025GC6U/C6T1, MPVZ7025GC6U | 482A      | Side with Port Attached       |
| MPXV7025GP, MPVZ7025GP          | 1369      | Side with Port Attached       |
| MPXV7025DP, MPVZ7025DP          | 1351      | Side with Part Marking        |
| MPVZ7025G6U                     | 482       | Side with Part Marking        |

## MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the surface mount packages must be the correct size to ensure proper solder connection interface between the board and the package. With the correct

footprint, the packages will self align when subjected to a solder reflow process. It is always recommended to design boards with a solder mask layer to avoid bridging and shorting between solder pads.
