TO BE VERY CAREFUL !

The LCD driver ICs are made by CMOS process, which are very easy to be damaged by static charge, make sure the user is grounded when handling the LCM.

COMMAND DESCRIPTION

Display ON/OFF

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	0	1	0	1	1	1	D	AEH, AFH

This command turns the display ON or OFF.

D=1 : Display ON

D=0 : Display OFF

Display Start Line

This command specifies the line address shown in page 13 and indicates the display line that corresponding to COM 0. The display area begins at the specified line address and continues in the line address increment direction. This area having the number of line of specified display duty is displayed. If the line address is changed dynamically by this command, the vertical smooth scrolling and paging can be used.

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	1	0	A4	A3	A2	A1	A0	C0H to DFH

This command loads the display start line register.

A4	A3	A2	A1	A0	Line Address
0	0	0	0	0	0
0	0	0	0	1	1
		⋮			⋮
1	1	1	1	1	31

See the figure in page 13.

Set Page address

This command specifies the page address that corresponds to the low address of the display data RAM when it is accessed by the MPU. Any bit of the display data RAM can be accessed when its page address and column address are specified. The display status is not changed even when the page address is changed.

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	11	0	1	1	1	0	A1	A0	B8H to BBH

This command loads the page address register.

A1	A0	Page
0	0	0
0	1	1
1	0	2
1	1	3

See the figure in page 13.

Set Column Address

This command specifies a column address of the display data RAM. When the display data RAM is accessed by the MPU continuously, the column address is increased by 1 every time. Therefore the MPU can access to data continuously. The column address stops to be incremented at address 80, and the page address is not changed continuously.

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	A6	A5	A4	A3	A2	A1	A0

Read Status

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	BUSY	ADC	ON/OFF	RESET	0	0	0	0

00H to 4FH

Reading the command I/O register (Ao=0) yields system status information.

- The busy bit indicates whether the driver will accept a command or not.
 - Busy=1: The driver is currently executing a command or is resetting. No new command will be accepted.
 - Busy=0: The driver will accept a new command.
- The ADC bit indicates the way column addresses are assigned to a segment drivers
 - ADC=1: Normal. Column address n → segment address n.
 - ADC=0: Inverted. Column address 79-u → segment driver u.
- The ON/OFF bit indicates the current status of the display.
 - It is the inverse of the polarity of the display ON/OFF command.
 - ON/OFF=1: Display OFF.
 - ON/OFF=0: Display ON.
- The RESET bit indicates whether the driver is executing a hardware or a software reset or it is in a normal operating mode.
 - RESET=1: Currently executing the reset command.
 - RESET=0: Normal operating.

Write Display Data

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	Write Data							

To write an 8-bit data into the display RAM, at a location specified by the contents of the column address and page address register by one.

Read Display Data

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
1	0	1	Read Data							

To read an 8-bit data from the data I/O latch, updates the contents of the I/O latch with display data from the display data RAM location specified by the contents of the column address and page address registers and then increments the column address register.

After loading a new address into the column address register one dummy read is required before valid data is obtained.

Select ADC

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	0	0	D

A0H, A1H

This command selects the relationship between display data RAM column address and segment driver.

D=0: SEG0 ← column address 00H, ...(normal)

This command is provided to reduce restrictions on the placement of the driver ICs and routing of tracing during printed circuit board layout. In this LCD module the D should be cleared to 0.

Static Driver ON/OFF

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	0	1	0	D

A4H, A5H

To force the display on and all common outputs to be selected.

D=1: Static driver ON.

D=0: Static driver OFF.

Select Duty

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1	0	0	D

A8H, A9H

To set the D-bit to 1 because the LCD module is 1/32 duty.

End

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	1	1	1	0

EEH

This command cancels the **Read-Modify-Write** mode and restores the contents of the column address register to their value prior to the receipt of the **Read-Modify-Write** command.

Reset

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	1	0

E2H

This command clears:

The display start line register and to set page address register to 3 page.

It does not affect the contents of the display data RAM. When the power supply is turned on, the user must sent a Reset signal into the RES pin. The Reset command cannot be used instead of this Reset signal.

Read-Modify-Write

Ao	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	1	1	1	0	0	0	0	0	E0H

This command defeats column address register auto-increment after reading data. The current contents of the column address register are saved. This mode remains active until an **END** command is received.

INITIALIZATION PROCEDURE

Detects a rising edge or falling edge of an RES input and initializes the MPU during power-on.
Initialization status:

1. Display is OFF
2. Display start line register is set to line 1
3. Static drive is turn off
4. Column address counter is set to address 0.
5. Page address register is set to page 3.
6. 1/32 duty is selected.
7. Forward ADC is selected(ADC command D0 is 1 and ADC status flag is 1)
8. Read-modify-write is OFF.

The input signal level at RES pin is sensed, and the MPU interface mode is selected as shown in Table below. For the 80-series MPU, the RES pin is passed through the inverter and the active high reset signal must be entered. For the 68-series MPU, the active low reset signal must be entered.

RES signal input level	MPU type	Ao	E	R/W	CS	D0~D7
Active LOW	68-series	↑	↑	↑	↑	↑
Active HIGH	80-series	↑	RD	WR	↑	↑

APPEARANCE CHECK

CONDIITON OF APPEARANCE CHECK:

- (1) Specimen shall be checked by eyes in distance of 30cm under 40w-fluorescence lamp.
- (2) Checking direction shall be in 45 degree from perpendicular line op specimen surface.

HANDLING PRECAUTIONS

- (1) Treat polarizer very carefully since it is easy to be damaged.
- (2) When cleaning the display surface, use soft cloth (e.g. gauss) with a solvent (recommended below) and wipe lightly.

- ◆ ethyl alcohol
- ◆ iso-procolol

Do not wipe the display surface with dry or hard materials that will damage the polarizer surface.

Do not use the following solvents:

- ◆ water
- ◆ ketone
- ◆ aromatics

- (3) Direct current causes electro-chemical reaction with remarkable degradation of the display quality. Give careful consideration to prevent direct current at ON/OFF timing and during operation.
- (4) Avoid strong shock and drop from the height.
- (5) To prevent LCD panels from degradation, do not operate or store them exposed directly to sunshine or high temperature/humidity.
- (6) Give careful consideration to avoid electrical static discharge with causes uneven contrast.
- (7) Even a small condensation on the contact pads (terminals) causes electro-chemical reaction which makes missing row and column. Give careful attention to avoid condensation. When assembling with zebra connector, clean the surface of the pads with alcohol and keep the air very clean.
