

LTC2418

8-/16-Channel Differential

24-Bit $\Delta\Sigma$ ADC

DESCRIPTION

The LTC[®]2418 is a high resolution, 24-bit $\Delta\Sigma$ ADC with 5ppm INL and 5 μ V offset. Channel selection is programmed through a simple serial interface. Since there is no latency, each conversion is valid, even after a change in input channel.

DC571A is a member of Linear Technology's QuikEval[™] family of demonstration boards.

It is designed to allow easy evaluation of the LTC2418 and may be connected directly to the target application's analog

signals while using the DC590 USB serial controller board and supplied software to measure performance.

After evaluating with LTC's software, the digital signals can be connected to the application's processor/controller for development of the serial interface.

Design files for this circuit board are available at <http://www.linear.com/demo>

LT, LT, LTC, LTM, Linear Technology and the Linear logo are registered trademarks and QuikEval is a trademark of Linear Technology Corporation. All other trademarks are the property of their respective owners.

QUICK START PROCEDURE

Connect DC571 to DC590 USB serial controller using the supplied 14-conductor ribbon cable. Connect DC590 to host PC with a standard USB A/B cable. Run the evaluation software supplied with DC590 or downloaded from www.linear.com/software. The correct program will be loaded automatically.

Click the COLLECT button to start reading the input voltage. Click the slider at the bottom of the strip-chart display to change the input channel being displayed. For differential measurements, Even channel pos and odd channel pos correspond to even channels being positive inputs or odd channels being positive inputs, respectively. See the LTC2418 data sheet for details of channel selection.

Tools are available for logging data, changing reference voltage, changing the number of points in the strip-chart and histogram, and changing the number of points averaged for the DVM display.

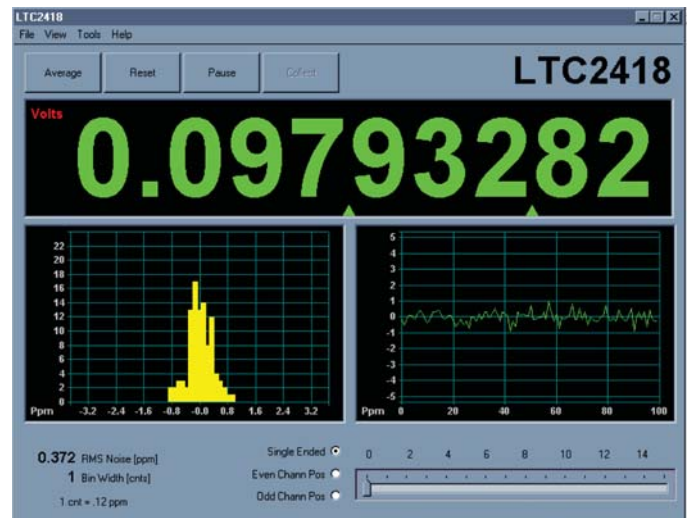

Figure 1. DC590 Program

HARDWARE SETUP

JUMPERS

JP1: Select the connection for the common pin, either ground or external connection. Single-ended measurements are taken with respect to this pin.

JP2 and JP3: Select the source for differential reference. Selecting 5V and GND will use the onboard 5V reference. Select EXT to use an external reference.

JP5: Select notch frequency, 60Hz or 50Hz. Alternatively, this jumper may be removed and an external conversion clock applied to the center pin of JP5.

CONNECTION TO DC590 SERIAL CONTROLLER

J1 is the power and digital interface connector. Connect to DC590 serial controller with supplied 14-conductor ribbon cable.

ANALOG CONNECTIONS

Analog signal connections are made via the turret posts along the edge of the board (CH0 to CH15.) Also, if you are connecting the board to an existing circuit, make full use of the four ground connections at the corners of the board.

EXPERIMENTS

Figure 2 shows a number of applications for the LTC2418.

CH0, CH1, CH2

Channels 0 and 1 measure the differential output of an Intersema MS5401 absolute pressure sensor. The 6.8k resistor performs a first order temperature compensation of the bridge output. CH2 measures the bridge voltage, which provides a convenient temperature measurement. This can also be used to perform further temperature compensation in software.

CH3

Channel 3 measures the output of a thermistor in a half bridge circuit. Many thermistors will work, the constraints are that the bridge output must have an impedance of less than 20k and the voltage must not go above $V_{REF}/2$.

CH4

Channel 4 measures the output of a type J thermocouple. The circuit shown for channel 3 can be used for cold junction compensation. The cold junction sensor should be close to the connections of the thermocouple to the board.

CH5

Channel 5 measures the output of an Omega OS36-01 infrared thermocouple. This can be used for remote temperature measurement.

CH6

Channel 6 measures the photocurrent of a Hamamatsu S1336-5BK photodiode.

CH7

Channel 7 measures the output of a resistive attenuator.

CH8, CH9

Channels 8 and 9 measure the drop across a Deltec SWE-3000-50 current shunt. Up to 3000A can be measured, with a resolution of 60mA. With careful grounding, both positive and negative currents can be measured. Care must be taken to ensure that both inputs stay more positive than GND-0.3V.

CH10

Channel 10 is buffered with an LT1793 FET input amplifier suitable for very high source impedance measurements.

CH11

Channel 11 measures the output of a precision rectifier.

CH12, CH13

Channels 12 and 13 measure a 3-wire RTD. The differential voltage is the output, and CH12 single-ended reading is the ground lead compensation.

CH14, CH15

Channels 14 and 15 measure the output of a 350 Ω bridge. This is standard for a wide variety of sensors. Typically the full-scale output voltage is only 10mV. However, the LTC2418 still gives 13 effective bits of resolution with no amplification.

DEMO MANUAL DC571A

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
