1. GENERAL DESCRIPTION

The PAC5220 belongs to Active-Semi's broad portfolio of full-featured Power Application Controller® (PAC) products that are highly optimized for controlling and powering next generation smart energy appliances, devices, and equipment. These application controllers integrate a 50MHz ARM® Cortex®-M0 32-bit microcontroller core with Active-Semi's proprietary and patent-pending Multi-Mode Power Manager™, Configurable Analog Front End™, and Application Specific Power Drivers™ to form the most compact microcontroller-based power and general purpose application systems ranging from digital power supply to motor control. The PAC5220 microcontroller features up to 32kB of embedded FLASH and 8kB of SRAM memory, a high-speed 10-bit 1µs analog-to-digital converter (ADC) with dual auto-sampling sequencers, 5V/3.3V I/Os, flexible clock sources, timers, a versatile 14-channel PWM engine, and several serial interfaces.

The Multi-Mode Power Manager (MMPM) provides "all-in-one" efficient power management solution for multiple types of power sources. It features a configurable multi-mode switching supply controller capable of operating in buck, flyback, or boost mode, and up to four linear regulated voltage supplies. The Application Specific Power Drivers (ASPD) are high-voltage power drivers designed for each target set of control applications, including half bridge, H-bridge, 3-phase, intelligent power module (IPM), and general purpose driving. The Configurable Analog Front End (CAFE) comprises differential programmable gain amplifiers, single-ended programmable gain amplifiers, comparators, digital-to-analog converters, and I/Os for programmable and inter-connectible signal sampling, feedback amplification, and sensor monitoring of multiple analog input signals. Together, these modules and microcontroller enable a wide range of compact applications with highly integrated power management, driving, feedback, and control for DC supply up to 52V and for line AC supply.

Figure 1-1. Power Application Controller

The PAC5220 is available in a 56-pin, 8mmx8mm TQFN package. The PAC family includes a range of part numbers optimized to work with different targeted primary applications.

2. PAC FAMILY APPLICATIONS

- Power Tools
- Garden Tools
- White Goods
- Embedded Speed Controllers
- Motor controllers

Figure 2-1. Simplified Application Diagram

3. PRODUCT SELECTION SUMMARY

Table 3-1. Product Selection Summary

		POW MANA			NAL	IGUR OG F END	RON		APPLICATION S		С	N	/IICR	осо	NTR	OLLEF	R	
PART NUMBER	PIN PKG	INPUT VOLTAGE	MULTI-MODE SW	DIFF-PGA	PGA	COMPARATOR	DAC	ADC CHANNEL	POWER DRIVER	PWM CHANNEL	FAULT PROTECT	SPEED (MHz)	FLASH (KB)	SRAM (KB)	GPIO	INTERFACE	XTAL	PRIMARY APPLICATION
PAC5220	56-pin 8x8 TQFN	5.2- 52V	Y	3	4	10	2	11	3 LS (1A/1A) 3 HS (1A/1A) 2 OD (40V/40mA)	6	Int	50	32	8	28	SPI I ² C UART SWD	Y	3 half bridge, 3-phase control

Notes: DIFF-PGA = differential programmable gain amplifier, GD = gate driver, HS = high-side , LS = low-side, OD = open-drain driver, PGA = programmable gain amplifier, UHV = ultra-high-voltage.

4. ORDERING INFORMATION

Table 4-1. Ordering Information

PART NUMBER ⁽²⁾	PART NUMBER ⁽²⁾ TEMPERATURE RANGE		PINS	PACKING
PAC5220QS	-40°C to 105°C	TQFN88-56	56 + Exposed Pad	Tray

⁽¹⁾ See Product Selection Summary for product features for each part number.

⁽²⁾ For the latest packaging and ordering information please see http://www.active-semi.com/ or contact us under sales@active-semi.com.

5. PAC5220 FEATURES

- Proprietary Multi-Mode Power Manager
 - Multi-mode switching supply controller configurable as high-voltage or ultra-high-voltage buck, AC/DC or flyback
 - ◆ DC supply up to 52V or line AC input
 - ◆ 4 linear regulators with power and hibernate management
 - Power and temperature monitor, warning, and fault detection
- Proprietary Configurable Analog Front End
 - ◆ 10 analog front end I/O pins
 - 3 differential programmable gain amplifiers
 - ◆ 4 single-ended programmable gain amplifiers
 - ◆ 10 comparators
 - ◆ 2 DACs (10-bit and 8-bit)
- Proprietary Application Specific Power Drivers
 - ◆ 3 low-side and 3 high-side gate drivers
 - 1A gate driving capability
 - ◆ 2 open-drain drivers
 - Configurable delays and fast fault protection
- 50MHz ARM Cortex-M0 32-bit microcontroller core
 - ◆ Fast single cycle 32-bit x 32-bit multiplier
 - ◆ 24-bit SysTick timer
 - Nested vectored interrupt controller (NVIC) with 20 external interrupts
 - Wake-up interrupt controller allowing power-saving sleep modes
 - Clock-gating allowing low power operation
- 32kB FLASH and 8kB SRAM memory
- 10-bit 1µs ADC with multi-input/multi-sample control engine
 - ◆ 11 ADC inputs including input from configurable analog front end
- 3.3V I/Os
 - ◆ 4 general purpose I/Os with tri-state and dedicated analog input to ADC
- True 5V I/Os
 - ◆ 14 general purpose I/Os with tri-state, pull-up and pull-down and dedicated I/O supply
 - ◆ Configurable as true 5V or 3.3V I/Os
- Flexible clock and PLL from internal 2% oscillator, ring oscillator, external clock, or crystal
- 9 timing generators
 - Four 16-bit timers with up to 16 PWM/CC blocks and 7 independent dead-time controllers
 - 24-bit watchdog timer
 - ◆ 4s or 8s watchdog timer
 - ♦ 24-bit real time clock
 - ◆ 24-bit SysTick timer
 - ♦ Wake-up timer for sleep modes from 0.125s to 8s
- SPI, I²C, and UART communication interfaces
- SWD debug interface with interface disable function

6. ABSOLUTE MAXIMUM RATINGS

Table 6-1. Absolute Maximum Ratings

(Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.)

PARAMETER	VALUE	UNIT
VHM, DRM to VSSP	-0.3 to 54	V
VP to VSS	-0.3 to 20	V
CSM, REGO to VSS	-0.3 to V _P + 0.3	V
VSYS, AIO6/ to VSS	-0.3 to 6	V
VCC33 to VSS	-0.3 to 4.1	V
VCC18 to VSS	-0.3 to 2.5	V
AlOx/ (except AlO6/), VCCIO to VSS	-0.3 to V _{SYS} + 0.3	V
PDx/, PEx/ to VSS	-0.3 to V _{CCIO} + 0.3	V
XIN, XOUT to VSS	-0.3 to V _{CC18} + 0.3	V
PCx/ to VSSA	-0.3 to V _{CC33} + 0.3	V
PAx/, PBx/, PCx/, PDx/, PEx/ pin injection current	7.5	mA
PAx/, PBx/, PCx/, PDx/, PEx/ sum of all pin injection current	25	mA
DRLx to VSSP	-0.3 to V _P + 0.3	V
DRBx to VSSP	-0.3 to 66	V
DRSx to VSSP	-6 to 54	V
DRSx allowable offset slew rate (dV _{DRSx} /dt)	5	V/ns
DRBx, DRHx to respective DRSx	-0.3 to 17	V
OHIx to VSSP	-0.3 to 48	V
VSSP, VSSA to VSS	-0.3 to 0.3	V
VSS, VSYS, DRM, DRLx, DRHx, REGO, OHIx RMS current ⁽¹⁾	0.2	A _{RMS}
VSSP RMS current ⁽¹⁾	0.4	A _{RMS}
VP RMS current ⁽¹⁾	0.6	A _{RMS}
Operating temperature range	-40 to 105	°C
Human body model (JEDEC)	2	kV
Electrostatic discharge (ESD) Charge device model (JEDEC)	1	kV
Machine model (JEDEC)	200	V

⁽¹⁾ Peak current can be 10 times higher than RMS value for pulses shorter than 10µs.

8. PIN CONFIGURATION

8.1. PAC5220QS

Figure 8-1. PAC5220QS Pin Configuration (TQFN88-56 Package)

9. PIN DESCRIPTION

Table 9-1. Multi-Mode Power Manager and System Pin Description

PIN NAME	PIN NUMBER	TYPE	DESCRIPTION			
CSM	20	Analog	Switching supply current sense input. Connect to the positive side of the current sense resistor.			
DRM	23	Analog	Switching supply driver output. Connect to the base or gate of the external power NPN or n-channel MOSFET. See <i>PAC User Guide</i> and application notes.			
EP (VSS)	EP	Power	Exposed pad. Must be connected to $V_{\rm SS}$ in a star ground configuration. Connect to a large PCB copper area for power dissipation heat sinking.			
REGO	19	Power	System regulator output. Connect to $V_{\mbox{\scriptsize SYS}}$ directly or through an external power-dissipating resistor.			
VCC18	56	Power	Internally generated 1.8V core power supply. Connect a $2.2\mu F$ or higher value ceramic capacitor from V_{CC18} to V_{SSA} . See Figure 9-1. Power Supply Bypass Capacitor Routing below.			
VCC33	5	Power	Internally generated 3.3V power supply. Connect a 2.2 μ F or higher value ceramic capacitor from V _{CC33} to V _{SSA} . See PCB layout note below.			
VCCIO	53	Power	Internally generated digital I/O power supply. Connect a 4.7 μ F or higher value ceramic capacitor from V _{CCIO} to V _{SSA} . See Figure 9-1. Power Supply Bypass Capacitor Routing below.			
VHM	22	Power	Switching supply controller supply input. Connect a 1µF or higher value ceramic capacitor, or a 0.1µF ceramic capacitor in parallel with a 10µF or higher electrolytic capacitor from V_{HM} to V_{SSP} . This pin requires good capacitive bypassing to V_{SSP} , so the ceramic capacitor must be connected with a shorter than 10mm trace from the pin. See Figure 9-1. Power Supply Bypass Capacitor Routing below.			
VP	21	Power	Main power supply. Provides power to the power drivers as well as voltage feedback path for the switching supply. Connect a properly sized supply bypass capacitor in parallel with a 0.1µF ceramic capacitor from V_P pin to $V_{\rm SS}$ for voltage loop stabilization. This pin requires good capacitive bypassing to $V_{\rm SS}$, so the ceramic capacitor must be connected with a shorter than 10mm trace from the pin. See See Figure 9-1. Power Supply Bypass Capacitor Routing below.			
VSS	7	Power	Ground.			
VSSA	6	Power	Analog ground. Connect to V _{ss} in a star ground configuration.			
VSSP	24	Power	Power ground. Connect to V _{ss} in a star ground configuration.			
VSYS	18	Power	5V system power supply. Connect a 4.7 μ F or higher value ceramic capacitor from V _{SYS} to V _{SSP} . See Figure 9-1. Power Supply Bypass Capacitor Routing below.			
XIN	54	Analog	Crystal oscillator driver input. Leave floating if unused.			
XOUT	55	Analog	Crystal oscillator driver output. Leave floating if unused.			

Table 9-2. Configurable Analog Front End Pin Description

PIN NAME	PIN NUMBER	FUNCTION	TYPE	DESCRIPTION
ALCO/DAON	0	AIO0	I/O	Analog front end I/O 0.
AIO0/DA0N	8	DA0N	Analog	Differential PGA 0 negative input.
		AIO1	I/O	Analog front end I/O 1.
AIO1/DA0P/PCMP0	9	DA0P	Analog	Differential PGA 0 positive input.
		PCMP0	Analog	Protection comparator input 0.
ALCO/DAAN	40	AIO2	I/O	Analog front end I/O 2.
AIO2/DA1N	10	DA1N	Analog	Differential PGA 1 negative input.
		AIO3	I/O	Analog front end I/O 3.
AIO3/DA1P/PCMP1	11	DA1P	Analog	Differential PGA 1 positive input.
		PCMP1	Analog	Protection comparator input 1.
ALC 4/DAON	40	AIO4	I/O	Analog front end I/O 4.
AIO4/DA2N	12	DA2N	Analog	Differential PGA 2 negative input.
		AIO5	I/O	Analog front end I/O 5.
AIO5/DA2P/PCMP2	13	DA2P	Analog	Differential PGA 2 positive input.
		PCMP2	Analog	Protection comparator input 2.
		AIO6	I/O	Analog front end I/O 6.
		AMP6	Analog	PGA input 6.
AIO6/AMP6/CMP6/BUF6/PBTN	14	CMP6	Analog	Comparator input 6.
		BUF6	Analog	Buffer output 6.
		PBTN	Analog	Push button input.
		AIO7	I/O	Analog front end I/O 7.
ALOZ/AMDZ/CMDZ/DLICZ	15	AMP7	Analog	PGA input 7.
AIO7/AMP7/CMP7/PHC7	15	CMP7	Analog	Comparator input 7.
		PHC7	Analog	Phase comparator input 7.
		AIO8	I/O	Analog front end I/O 8.
ALCO /ANADO /ONADO /DLIGO	40	AMP8	Analog	PGA input 8.
AIO8/AMP8/CMP8/PHC8	16	CMP8	Analog	Comparator input 8.
		PHC8	Analog	Phase comparator input 8.
		4100	I/O	Analog front end I/O 9.
		AIO9	"0	Thialog home one is o o.
ALOQ/AMPO/CMPO/DLICO	17	AMP9	Analog	PGA input 9.
AIO9/AMP9/CMP9/PHC9	17		+	

Table 9-3. Application Specific Power Drivers Pin Description

PIN NAME	PIN NUMBER	TYPE	DESCRIPTION		
DRB3	30	Analog	High-side gate driver bootstrap 3.		
DRB4	33	Analog	High-side gate driver bootstrap 4.		
DRB5	36	Analog	High-side gate driver bootstrap 5.		
DRH3	29	Analog	High-side gate driver 3.		
DRH4	32	Analog	High-side gate driver 4.		
DRH5	35	Analog	High-side gate driver 5.		
DRL0	25	Analog	Low-side gate driver 0.		
DRL1	26	Analog	Low-side gate driver 1.		
DRL2	27	Analog	Low-side gate driver 2.		
DRS3	28	Analog	High-side gate driver source 3.		
DRS4	31	Analog	High-side gate driver source 4.		
DRS5	34	Analog	High-side gate driver source 5.		
OHI6	37	OD, I	High-voltage open-drain driver and input 6.		
OHI7	38	OD, I	High-voltage open-drain driver and input 7.

PIN NAME	PIN NUMBER	FUNCTION	TYPE	DESCRIPTION
		PE3	I/O	I/O port E3.
PE3/SPICS0/nRESET1	50	SPICS0	0	SPI chip select 0.
		nRESET1	I	Reset input 1 (active low).
		PE4	I/O	I/O port E4.
PE4/SPICS1/I2CSCL	51	SPICS1	0	SPI chip select 1.
		I2CSCL	I/O	I2C clock.
		PE5	I/O	I/O port E5.
PE5/SPICS2/I2CSDA	52	SPICS2	0	SPI chip select 2.
		I2CSDA	I/O	I2C data.

Figure 9-1. Power Supply Bypass Capacitor Routing

10. MULTI-MODE POWER MANAGER (MMPM)

10.1. Features

- Multi-mode switching supply controller configurable as high voltage or ultra-high-voltage buck, AC/DC
- DC supply up to 52V or line AC input
- 4 linear regulators with power and hibernate management
- Power and temperature monitor, warning, and fault detection

10.2. Block Diagram

Figure 10-1. Multi-Mode Power Manager

10.3. Functional Description

The Multi-Mode Power Manager (Figure 10-1) is optimized to efficiently provide "all-in-one" power management required by the PAC and associated application circuitry from a wide range of input power sources. It incorporates a dedicated multi-mode switching supply (MMSS) controller operable as a buck, flyback, or boost converter to efficiently convert power from a DC or AC input source to generate a main supply output V_P . Four linear regulators provide V_{SYS} , V_{CCIO} , V_{CC33} , and V_{CC18} supplies for 5V system, 5V or 3.3V I/O, 3.3V mixed signal, and 1.8V microcontroller core circuitry. The power manager also handles system functions including internal reference generation, timers, hibernate mode management, and power and temperature monitoring.

10.3.1. Multi-Mode Switching Supply (MMSS) Controller

The MMSS controller drives an external power transistor for pulse-width modulation switching of an inductor or transformer for power conversion. The DRM output drives the gate of the n-channel MOSFET or the base of the NPN between the V_{HM} on state and V_{SSP} off state at proper duty cycle and switching frequency to ensure that the main supply voltage V_P is regulated. The V_P regulation voltage is initially set to 9V during start up, and can be

reconfigured to be 5V, 12V, or 15V by the microcontroller after initialization. When V_P is lower than the target regulation voltage, the internal feedback control circuitry causes the inductor current to increase to raise V_P . Conversely, when V_P is higher than the regulation voltage, the feedback loop control causes the inductor current to decrease to lower V_P . The feedback loop is internally stabilized. The output current capability of the switching supply is determined by the external current sense resistor. In the high-side current sense buck mode, the inductor current signal is sensed differentially between the CSM pin and V_P , and has a peak current limit threshold of 0.26V. In the low-side current sense flyback or boost mode, the inductor current signal is sensed differentially between the CSM pin and V_{SSP} , and has a peak current limit threshold of 1V.

The MMSS controller is flexible and configurable as a buck, flyback, or boost converter. Input sources include battery supply for buck mode (Figure 10-2), and AC line supply voltage range for ultra-high-voltage buck mode (Figure 10-3), AC/DC flyback mode(Figure10-4). The MMSS controller operational mode is determined by external configuration and register setting from the microcontroller after power up. It can operate in either high-side or low-side current sense mode, and does not require external feedback loop compensation circuitry. For optional extended application range, the MMSS also incorporates additional digital control by the microcontroller to add accurate computations for outer feedback loop control such as power factor correction and accurate current control.

Figure 10-2. Buck Mode

Figure 10-3. Ultra-High-Voltage Buck Mode

Figure 10-4. AC/DC Flyback Mode

The MMSS detects and selects between high-side and low-side mode during start up based on the placement of the current sense resistor and the CSM pin voltage. It employs a safe start up mode with a 9.5kHz switching frequency until V_P exceeds 4.3V under-voltage-lockout threshold, then transitions to the 45kHz default switching frequency for at least 6ms to bring V_P close to the target voltage, before enabling the linear regulators. Any extra load should only be applied after the supplies are available and the microprocessor has initialized. The switching frequency can be reconfigured by the microprocessor to be 181kHz to 500kHz in the high switching frequency mode for battery-based applications, and to be 45kHz to 125kHz in the low switching frequency mode for AC applications. Upon initialization, the microcontroller must reconfigure the MMSS to the desired settings for V_P regulation voltage, switching mode, switching frequency, and V_{HM} clamp. Refer to the PAC application notes and user guide for MMSS controller design and programming.

If a stable external 5V to 18V power source is available, it can power the V_P main supply and all the linear regulators directly without requiring the MMSS controller to operate. In such applications, V_{HM} can be connected directly to V_P and the microcontroller should disable the MMSS upon initialization to reduce power loss.

10.3.2. Linear Regulators

The MMPM includes up to four linear regulators. The system supply regulator is a medium voltage regulator that takes the V_P supply and sources up to 200mA at REGO until V_{SYS} , externally coupled to REGO, reaches 5V. This allows a properly rated external resistor to be connected from REGO to V_{SYS} to close the current loop and offload power dissipation between V_P and V_{SYS} . Once V_{SYS} is above 4V, the three additional 40mA linear regulators for V_{CCIO} , V_{CC33} , and V_{CC18} supplies sequentially power up. Figure 10-5 shows typical circuit connections for the linear regulators. For 5V I/O systems, short the V_{CCIO} pin to V_{SYS} to bypass the V_{CCIO} regulator. For 3.3V I/O systems, the V_{CCIO} regulator generates 3.3V. The V_{CC33} and V_{CC18} regulators generate 3.3V and 1.8V, respectively. When V_{SYS} , V_{CCIO} , V_{CC33} , and V_{CC18} are all above their respective power good thresholds, and the configurable power on reset duration has expired, the microcontroller is initialized.

Figure 10-5. Linear Regulators

10.3.3. Power Up Sequence

The MMPM follows a typical power up sequence as in the Figure 10-6 below. A typical sequence begins with input power supply being applied, followed by the safe start up and start up durations to bring the switching supply output V_P to 9V, before the linear regulators are enabled. When all the supplies are ready, the internal clocks become available, and the microcontroller starts executing from the program memory. During initialization, the microcontroller can reconfigure the switching supply to a different V_P regulation voltage such as 15V and to an appropriate switching frequency and switching mode. The total loading on the switching supply must be kept below 25% of the maximum output current until after the reconfiguration of the switching supply is complete. For AC input supply applications, the start up sequence includes an additional charging time for V_{HM} depending on the start-up resistor and capacitor values.

Figure 10-6. Power Up Sequence

10.3.4. Hibernate Mode

The IC can go into an ultra-low power hibernate mode via the microcontroller firmware or via the optional push button (PBTN, see *Push Button* description in *Configurable Analog Front End*). In hibernate mode, only a minimal amount (typically 18µA) of current is used by V_{HM}, and the MMSS controller and all internal regulators

are shut down to eliminate power drain from the output supplies. The system exits hibernate mode after a wake-up timer duration (configurable from 125ms to 8s or infinite) has expired or, if push button enabled, after an additional push button event has been detected. When exiting the hibernate mode, the power manager goes through the start up cycle and the microcontroller is reinitialized. Only the persistent power manager status bits (resets and faults) are retained during hibernation.

10.3.5. Power and Temperature Monitor

Whenever any of the V_{SYS} , V_{CCIO} , V_{CC33} , or V_{CC18} power supplies falls below their respective power good threshold voltage, a fault event is detected and the microcontroller is reset. The microcontroller stays in the reset state until V_{SYS} , V_{CCIO} , V_{CC33} , and V_{CC18} supply rails are all good again and the reset time has expired. A microcontroller reset can also be initiated by a maskable temperature fault event that occurs when the IC temperature reaches 170°C. The fault status bits are persistent during reset, and can be read by the microcontroller upon reinitialization to determine the cause of previous reset.

A power monitoring signal V_{MON} is provided onto the ADC pre-multiplexer for monitoring various internal power supplies. V_{MON} can be set to be V_{CC18} , $0.4 \cdot V_{CC33}$, $0.4 \cdot V_{CCIO}$, $0.4 \cdot V_{SYS}$, $0.1 \cdot V_{REGO}$, $0.1 \cdot V_{P}$, $0.0333 \cdot V_{HM}$, or the internal compensation voltage V_{COMP} for switching supply power monitoring.

For power and temperature warning, a V_P low event at 77% of the regulation voltage and an IC temperature warning event at 140°C are provided as maskable interrupts to the microcontroller. These warnings allow the microcontroller to safely power down the system.

In addition to the temperature warning interrupt and fault reset, a temperature monitor signal $V_{TEMP} = 1.5 + 5.04e-3 \cdot (T - 25^{\circ}C)$ (V) is provided onto the ADC pre-multiplexer for IC temperature measurement.

10.3.6. Voltage Reference

The reference block includes a 2.5V high precision reference voltage that provides the 2.5V reference voltage for the ADC, the DACs, and the 4-level programmable threshold voltage V_{THREF} (0.1V, 0.2V, 0.5V, and 1.25V).

10.4. Electrical Characteristics

Table 10-1. Multi-Mode Switching Supply Controller Electrical Characteristics (V_{HM} = 24V, V_P = 12V, and T_A = -40°C to 105°C unless otherwise specified.)

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT
Input Supply	y (V _{HM})					
$I_{HIB;VHM}$	V _{HM} hibernate mode supply current	V _{HM} , hibernate mode		18	36	μA

11. CONFIGURABLE ANALOG FRONT END (CAFE)

11.1. Block Diagram

Figure 11-1. Configurable Analog Front End

11.2. Functional Description

The device includes a Configurable Analog Front End (CAFE, Figure 11-1) accessible through up to 10 analog and I/O pins. These pins can be configured to form flexible interconnected circuitry made up of up to 3 differential programmable gain amplifiers, 4 single-ended programmable gain amplifiers, 4 general purpose comparators, 3 phase comparators, 10 protection comparators, and one buffer output. These pins can also be programmed as analog feed-through pins, or as analog front end I/O pins that can function as digital inputs or digital open-drain outputs. The PAC proprietary configurable analog signal matrix (CASM) and configurable digital signal matrix (CDSM) allow real time asynchronous analog and digital signals to be routed in flexible circuit connections for different applications. A push button function is provided for optional push button on, hibernate, and off power management function.

11.2.1. Differential Programmable Gain Amplifier (DA)

The DAxP and DAxN pin pair are positive and negative inputs, respectively, to a differential programmable gain amplifier. The differential gain can be programmable to be 1x, 2x, 4x, 8x, 16x, 32x, and 48x for zero ohm signal source impedance. The differential programmable gain amplifier has -0.3V to 3.5V input common mode range, and its output can be configured for routing directly to the ADC pre-multiplexer, or through a sample-and-hold circuit synchronized with the ADC auto-sampling mechanism. Each differential amplifier is accompanied by offset calibration circuitry, and two protection comparators for protection event monitoring. The programmable gain differential amplifier is optimized for use with signal source impedance lower than 500Ω and with matched source impedance on both positive and negative inputs for minimal offset. The effective gain is scaled by $13.5k / (13.5k + R_{SOURCE})$, where R_{SOURCE} is the matched source impedance of each input.

11.2.2. Single-Ended Programmable Gain Amplifier (AMP)

Each AMPx input goes to a single-ended programmable gain amplifier with signal relative to V_{SSA}. The amplifier gain can be programmed to be 1x, 2x, 4x, 8x, 16x, 32x, and 48x, or as analog feed-through. The programmable gain amplifier output is routed via a multiplexer to the configurable analog signal matrix CASM.

11.2.3. General Purpose Comparator (CMP)

The general purpose comparator takes the CMPx input and compares it to either the programmable threshold voltage (V_{THREF}) or a signal from the configurable analog signal matrix CASM. The comparator has 0V to V_{SYS} input common mode range, and its polarity-selectable output is routed via a multiplexer to either a data input bit or the configurable digital signal matrix CDSM. Each general purpose comparator has two mask bits to prevent or allow rising or falling edge of its output to trigger second microcontroller interrupt INT2.

11.2.4. Phase Comparator (PHC)

The phase comparator takes the PHCx input and compares it to either the programmable threshold voltage (V_{THREF}) or a signal from the configurable analog signal matrix CASM. The comparison signal can be set to a phase reference signal generated by averaging the PHCx input voltages. In a three-phase motor control application, the phase reference signal acts as a virtual center tap for BEMF detection. The PHCx inputs are optionally fed through to the CASM. The phase comparator has 0V to V_{SYS} input common mode range, and its polarity-selectable output is routed to a data input bit and to the phase/position multiplexer synchronized with the auto-sampling sequencers.

11.2.5. Protection Comparator (PCMP)

Two protection comparators are provided in association with each differential programmable gain amplifier, with outputs available to trigger protection events and accessible as read-back output bits. The high-speed protection (HP) comparator compares the PCMPx pin to the 8-bit HP DAC output voltage, with full scale voltage of 2.5V. The limit protection (LP) comparator compares the differential programmable gain amplifier output to the 10-bit LP DAC output voltage, with full scale voltage of 2.5V.

Each protection comparator has a mask bit to prevent or allow it to trigger the main microcontroller interrupt INT1. Each protection comparator also has one mask bit to prevent or allow it to activate protection event PR1,

and another mask bit to prevent or allow it to activate protection event PR2. These two protection events can be used directly by protection circuitry in the Application Specific Power Drivers (ASPD) to protect devices being driven.

11.2.6. Analog Output Buffer (BUF)

A subset of the signals from the configurable analog signal matrix CASM can be multiplexed to the BUF6 pin for external use. The buffer offset voltage can be minimized with the built-in swap function.

11.2.7. Analog Front End I/O (AIO)

Up to 10 AlOx pins are available in the device. In the analog front end I/O mode, the pin can be configured to be a digital input or digital open-drain output. The AlOx input or output signal can be set to a data input or output register bit, or multiplexed to one of the signals in the configurable digital signal matrix CDSM. The signal can be set to active high (default) or active low, with V_{SYS} supply rail. Where AlO_{6,7,8,9} supports microcontroller interrupt for external signals. Each has two mask bits to prevent or allow rising or falling edge of its corresponding digital input to trigger second microcontroller interrupt INT2.

11.2.8. Push Button (PBTN)

The push button PBTN, when enabled, can be used by the microcontroller to detect a user active-low push button event and to put the system into an ultra-low-power hibernate mode. Once the system is in hibernate mode, PBTN can be used to wake up the system. In addition, PBTN can also be used as a hardware reset for the microcontroller when it is held low for longer than 8s during normal operation. The PBTN input is active low and has a $55k\Omega$ pull-up resistor to 3V.

11.2.9. HP DAC and LP DAC

The 8-bit HP DAC can be used as the comparison voltage for the high-speed protection (HP) comparators, or routed for general purpose use via the AB2 signal in the CASM. The HP DAC output full scale voltage is 2.5V.

The 10-bit LP DAC can be used as the comparison voltage for the limit protection (LP) comparators, or routed for general purpose use via the AB3 signal in the CASM. The LP DAC output full scale voltage is 2.5V.

11.2.10. ADC Pre-Multiplexer

The ADC pre-multiplexer is a 16-to-1 multiplexer that selects between the 3 differential programmable gain amplifier outputs, AB1 through AB9, temperature monitor signal (V_{TEMP}), power monitor signal (V_{MON}), and offset calibration reference (V_{REF} / 2). The ADC pre-multiplexer can be directly controlled or automatically scanned by the auto-sampling sequencer.

When the ADC pre-multiplexer is automatically scanned, the unbuffered or sensitive signals should be masked by setting appropriate register bits.

11.2.11. Configurable Analog Signal Matrix (CASM)

The CASM has 9 general purpose analog signals labeled AB1 through AB9 that can be used for:

- Routing the single-ended programmable gain amplifier or analog feed-through output to AB1 through AB9
- Routing an analog signal via AB1, AB2, or AB3 to the negative input of a general purpose comparator or phase comparator
- Routing the 8-bit HP DAC output to AB2
- Routing the 10-bit LP DAC output to AB3
- Routing analog signals via AB1 through AB12 to the ADC pre-multiplexer
- Routing phase comparator feed-through signals to AB7, AB8, and AB9, and averaged voltage to AB1

11.2.12. Configurable Digital Signal Matrix (CDSM)

The CDSM has 7 general purpose bi-directional digital signals labeled DB1 through DB7 that can be used for:

- Routing the AlOx input to or output signals from DB1 through DB7
- Routing the general purpose comparator output signals to DB1 through DB7
- Routing the OHIx input signals to DB1 through DB7
- Routing the OHIx open-drain driver control signals from DB1 through DB7

12. APPLICATION SPECIFIC POWER DRIVERS (ASPD)

12.1. Features

- 3 low-side and 3 high-side gate drivers
- 1A gate driving capability
- Open-drain drivers with input capability
- Configurable delays and fast fault protection

12.2. Block Diagram

Figure 12-1. Application Specific Power Drivers

12.3. Functional Description

The Application Specific Power Drivers (ASPD, Figure 12-1) module handles power driving for power control applications. The PAC5220 has three low-side gate drivers (DRLx), three high-side gate drivers (DRHx), and two high-voltage open-drain drivers (OHIx). Each gate driver can drive an external MOSFET or IGBT switch in response to high-speed control signals from the microcontroller ports, and a pair of high-side and low-side gate drivers can form a half-bridge driver. The open-drain drivers provide activation control for relays, LEDs, buffers, and other loads.

Figure 12-2 below shows typical gate driver connections and Table 12-1 shows the ASPD resources available on different PAC part numbers. The PAC5220 gate drivers support up to a 52V supply.

Figure 12-2. Typical Gate Driver Connections

Table 12-1. Power Driver Resources by Part Numbers

PART		DW-SIDE GATE HIGH-SIDE GATE DRIVER		RIVER	OPEN-DRAIN DRIVER	
NUMBER	DRLx	SOURCE / SINK CURRENT	DRHx	MAX SUPPLY	SOURCE/ SINK CURRENT	OHIx
PAC5220	3	1A/1A	3	52V	1A/1A	2 (40V/ 40mA)

The ASPD includes built-in configurable fault protection for the internal gate drivers.

12.3.1. Low-Side Gate Driver

The DRLx low-side gate driver drives the gate of an external MOSFET or IGBT switch between the low-level V_{SSP} power ground rail and high-level V_{P} supply rail. The DRLx output pin has sink and source output current capability of 1A. Each low-side gate driver is controlled by a microcontroller port signal with 4 configurable levels of propagation delay.

12.3.2. High-Side Gate Driver

The DRHx high-side gate driver drives the gate of an external MOSFET or IGBT switch between its low-level DRSx driver source rail and its high-level DRBx bootstrap rail. The DRSx pin can go up to 52V steady state. The DRHx output pin has sink and source output current capability of 1A. The DRBx bootstrap pin can have a maximum operating voltage of 16V relative to the DRSx pin, and up to 64V steady state. The DRSx pin is designed to tolerate momentary switching negative spikes down to -5V without affecting the DRHx output state. Each high-side gate driver is controlled by a microcontroller port signal with 4 configurable levels of propagation delay.

For bootstrapped high-side operation, connect an appropriate capacitor between DRBx and DRSx and a properly rated bootstrap diode from V_P to DRBx. To operate the DRHx output as a low-side gate driver, connect its DRBx pin to V_P and its DRSx pin to V_{SSP} .

12.3.3. High-Side Switching Transients

Typical high-side switching transients are shown in Figure 12-3(a). To ensure functionality and reliability, the DRSx and DRBx pins must not exceed the peak and undershoot limit values shown. This should be verified by probing the DRBx and DRSx pins directly relative to VSS pin. A small resistor and diode clamp for the DRSx pin can be used to make sure that the pin voltage stays within the negative limit value. In addition, the high-side slew rate dV/dt must be kept within ±5V/ns for DRSx. This can be achieved by adding a resistor-diode pair in series, and an optional capacitor in parallel with the power switch gate. The parallel capacitor also provides a

low impedance and close gate shunt against coupling from the switch drain. These optional protection and slew rate control are shown in Figure 12-3(b).

Figure 12-3. High-Side Switching Transients and Optional Circuitry

(a) High-Side Switching Transients

(b) Optional Transient Protection and Slew Rate Control

12.3.4. Open-Drain Drivers

The OHIx pin can be configured to be a 40V/40mA or 40V/15mA open-drain driver output, or a logic input. When configured as an open-drain driver output, the OHIx pin can be controlled by either a register bit or a configurable digital signal matrix (CDSM) signal. With default polarity, the OHIx pin is switched to V_{SSP} with 17.5 Ω (40mA mode) or 50 Ω (15mA mode) impedance in the on state when the corresponding bit or signal is '1', and is in the high-impedance off state when the corresponding bit or signal is '0'. When configured as an input, the OHIx pin signal can flow to a register bit or to a CDSM signal. The polarity bit determines the signal polarity in both input and output modes.

12.3.5. Power Drivers Control

All power drivers are initially disabled from power-on-reset. To enable the power drivers, the microprocessor must first set the driver enable bit to '1'. The gate drivers are controlled by the microcontroller ports and/or PWM signals according to Table 12-2, with configurable delays as shown in Table 12-3. The OHIx open-drain drivers are controlled by their corresponding register bits. Refer to the PAC application notes and user guide for additional information on power drivers control programming.

Table 12-2. Microcontroller Port and PWM to Power Driver Mapping

Table 12-3. Power Driver Propagation Delay

DRI	Lx	DRHx			
RISING FALLING		RISING	FALLING		
130ns 140ns		160ns	140ns		

12.3.6. Gate Driver Fault Protection

The ASPD incorporates a configurable fault protection mechanism using protection signal from the Configurable Analog Front End (CAFE), designated as protection event 1 (PR1) signal. The DRL0/DRL1/DRL2 drivers are designated as low-side group 1. The DRH3/DRH4/DRH5 gate drivers are designated as high-side group 1. The PR1 signal from the CAFE can be used to disable low-side group 1, high-side group 1, or both depending on the PR1 mask bit settings.

13. ADC WITH AUTO-SAMPLING SEQUENCER

13.1. Block Diagram

Figure 13-1. ADC with Auto-Sampling Sequencer

13.2. Functional Description

13.2.1. ADC

The analog-to-digital converter (ADC) is a 10-bit succesive approximation register (SAR) ADC with 1 µs conversion time and up to 1MSPS capability. The ADC input clock has a user-configurable divider from /1 to /8 of the system clock. The integrated analog multiplexer allows selection from up to 6 direct ADx inputs, and from up to 10 analog inputs signals in the Configurable Analog Front End (CAFE), including up to 3 differential input pairs. The ADC can be configured for repeating or non-repeating conversions and can interrupt the microcontroller when a conversion is finished.

13.2.2. Auto-Sampling Sequencer

Two independent and flexible auto-sampling sequencer state machines allow signal sampling using the ADC without interaction from microcontroller core. Each auto-sampling sequencer state machine can be programmed to take and store up to 8 samples each in the ADC result register from different analog inputs, able to control the ADC MUX and ADC Premux as well as the precise timing of the S/H in the Configurable analog front end. The sampling start of the auto-sampling sequencer can be precisely triggered using timers A, B, C, or D or any of their associated PWM edges (high-to-low or low-to-high). It also supports manual start or a ping-pong-scheme, where one auto-sampling sequencer state machine triggers the other when it finishes sampling.

The auto-sampling sequencer can interrupt the microcontroller when either conversion sequence is finished.

13.2.3. EMUX Control

A dedicated low latency interface controllable by the auto-sampling sequencer or register control allows changing the ADC premultiplexer and asserting/deasserting the S/H circuit in the configurable analog front end, allowing back to back conversions of multiple analog inputs without microcontroller interaction.

13.3. Electrical Characteristics

14. MEMORY SYSTEM

14.1. Features

- 32kB embedded FLASH
 - ◆ 100,000 program/erase cycles
 - ◆ 10 years data retention
- 8kB SRAM

14.2. Block Diagram

Figure 14-1. Memory System

14.3. Functional Description

The device has multiple banks of embedded FLASH memory, SRAM memory, as well as peripheral control registers that are all program-accessible in a flat memory map.

14.3.1. Program and Data FLASH

32kB in 32 pages of 1kB each is available for program or data memory. Each of them can be individually erased or written to while the microcontroller is executing a program from SRAM.

14.3.2. SRAM

Up to 8kB contiguous array of SRAM is available for non-persistent data storage. The SRAM memory supports word (4-byte), half-word (2-byte) and byte address aligned access. The microcontroller may execute code out of SRAM for time-critical applications, or when modifying the contents of FLASH memory.

15. CLOCK CONTROL SYSTEM

15.1. Features

- Ring oscillator with 7.5MHz, 9.6MHz, 13.8MHz, and 25.7MHz settings
- High accuracy 2% trimmed 4MHz RC oscillator
- Crystal oscillator driver supporting 2MHz to 10MHz crystals
- External clock input up to 40MHz
- PLL with 1MHz to 25 MHz input, and 3.5MHz to 100MHz output
- /1 to /8 clock divider for HCLK
- /1 to /128 clock divider for ACLK

15.2. Block Diagram

Figure 15-1 Clock Control System

15.3. Functional Description

The PAC clock control system covers a wide range of applications.

15.3.1. Free Running Clock (FRCLK)

The free running clock (FRCLK) is generated from one of the 4 clock sources: ring oscillator, trimmed RC oscillator, crystal driver or external clock input. The FRCLK is used for the real-time clock (RTC), watchdog timer (WDT), input to the PLL, or FCLK source to clock the system in low power and sleep mode.

15.3.2. Fast Clock (FCLK)

The fast clock (FCLK) is generated from the PLL or supplied by the FRCLK directly. The FCLK supplies the watchdog timer (WDT), ADC, wake-up interrupt controller (WIC), SysTick timer, Arm[®] Cortex[®]-M0 peripheral high speed clock (HCLK) and low speed clock (LSCLK).

15.3.3. High-Speed Clock (HCLK)

The high-speed clock (HCLK) is derived from the FCLK with a /1, /2, /4 or /8 divider. It supplies the peripheral AHB/APB bus, Timers A to D, dead-time controllers, SPI interface, I²C interface, UART interface, EMUX interface, SOC bridge interface and memory subsystem, and can go as high as 50MHz.

15.3.4. Auxiliary Clock (ACLK)

The auxiliary clock (ACLK) is derived from FCLK with a /1, /2, to /128 divider, and supplies the timer and dead-time blocks. It can be clocked faster or slower than HCLK and can go as high as 100MHz.

15.3.5. Clock Gating

The clock tree supports clock gating in deep-sleep mode for the timer block, ADC, SPI interface, I²C interface, UART interface, memory subsystem and the Arm[®] Cortex[®]-M0 itself.

15.3.6. Ring Oscillator (ROSC)

The integrated ring oscillator provides 4 different clocks with 7.5MHz, 9.6MHz, 13.8MHz, and 25.7MHz settings. After reset, the clock tree always defaults to this clock input with the lowest frequency setting.

15.3.7. Trimmed 4MHz RC Oscillator

The 2% trimmed 4MHz RC oscillator provides an accurate clock suitable for many applications. It is also used to derive the clock for the Multi-Mode Power Manager.

15.3.8. Internal Slow RC Oscillator

An internal 32kHz RC oscillator is used during start up to provide an initial clock to analog circuitry. It is not used as a clock input to the clock tree.

15.3.9. Crystal Oscillator Driver

The optional crystal oscillator driver can drive crystals from 2MHz to 10MHz to provide a highly accurate and stable clock into the system.

15.3.10. External Clock Input

The clock tree can be supplied with an external clock up to 10MHz.

15.3.11. PLL

The integrated PLL input clock is supplied by the FRCLK with an input frequency range of 1MHz to 25MHz. The PLL output frequency is adjustable from 3.5MHz to 100MHz.

15.4. Electrical Characteristics

16. ARM® CORTEX®-M0 MICROCONTROLLER CORE

16.1. Features

- Arm[®] Cortex[®]-M0 core
- Fast single-cycle 32-bit x 32-bit multiplier
- 24-bit SysTick timer
- Up to 50MHz operation
- Serial wire debug (SWD), with 4 break-point and 2 watch-point unit comparators
- Nested vectored interrupt controller (NVIC) with 25 external interrupts
- Wake-up interrupt controller (WIC) with GPIO, real-time clock (RTC) and watchdog timer (WDT) interrupts enabled
- Sleep and deep-sleep mode with clock gating

16.2. Block Diagram

Figure 16-1. Arm Cortex-M0 Microcontroller Core

16.3. Functional Description

The Arm® Cortex®-M0 microcontroller core is configured for little endian operation and includes the fast single-cycle 32-bit multiplier and 24-bit SysTick timer and can operate at a frequency of up to 50MHz.

The microcontroller nested vectored interrupt controller (NVIC) supports 25 external interrupts for the device's peripherals and sub-systems. For low-latency interrupt processing, the NVIC also supports interrupt tail-chaining. The wake-up interrupt controller (WIC) is able to wake up the device from low-power modes using any GPIO interrupt, as well as from the RTC or WDT. The Arm® Cortex®-M0 supports both sleep and deep-sleep low-power modes. The deep-sleep mode supports clock gating to limit standby power even further.

Firmware debug support includes 4 break-point and 2 watch-point unit comparators using the serial wire debug (SWD) protocol. The serial wire debug mechanism can be disabled to prevent device access to the firmware in the field.

17. I/O CONTROLLER

17.1. Features

- 5V-compliant I/O PAx, PDx, PEx
- 3.3V-compliant I/O PCx
- Configurable drive strength on PAx, PDx, PEx
- Configurable pull-up or pull-down on PAx, PDx, PEx

17.2. Block Diagram

Figure 17-1. I/O controller

17.3. Functional Description

The PAC can support up to 4 ports with 8 I/Os each from PAx, PCx, PDx, and PEx, in addition to the I/Os on the analog front end. All PAx, PCx, PDx, and PEx ports have interrupt capability with configurable interrupt edge.

PAx, PDx, and PEx I/Os use V_{CCIO} as the I/O supply voltage that is 5V on default parts (and 3.3V available from factory). The drive current can be configured as 8mA or 16mA. They also support weak pull-up and pull-down to save external components.

PCx uses V_{CC33} as its I/O supply voltage. The drive current is fixed to 8mA. PC0 to PC5 are also associated with analog inputs AD0 to AD5 to the ADC.

17.4. GPIO Current Injection

Under normal operation, there should not be current injected into the GPIOs on the device due to the GPIO voltage below ground or above the GPIO supply.² Current injected occurs when the GPIO pin voltage is less than -0.3V or when greater than GPIO supply + 0.3V.

In order provide a robust solution when this situation occurs, the PAC52XX family of products allows a small amount of injected current into the GPIO pins, to avoid excessive leakage or device damage.

For information on the GPIO current injection thresholds, see the absolute maximum parameters for this device.

Sustained operation with the GPIO pin voltage greater than the GPIO supply or when the GPIO pin voltage is less than -0.3V may result in reduced lifetime of the device. GPIO current injection should only be a temporary condition.

² VCC33 is the supply for any PC GPIO pin and VCCIO is the supply for any other GPIO pins.

18. SERIAL INTERFACE

18.1. Block Diagram

Figure 18-1. Serial Interface

18.2. Functional Description

The device has up to three serial interfaces: I2C, UART, and SPI.

18.2.1. I²C Controller

The I²C controller is a configurable peripheral that can support various modes of operation:

- I²C master operation
 - ◆ Normal mode (100kHz), fast mode (400kHz), or fast mode plus (1MHz)
 - ◆ Single and multi-master
 - ◆ Synchronization (multi-master)
 - ◆ Arbitration (multi-master)
 - ◆ 7-bit or 10-bit slave addressing
- I²C slave operation
 - ◆ Normal mode (100kHz), fast mode (400kHz), or fast mode plus (1MHz)
 - Clock stretching
 - ◆ 7-bit or 10-bit slave addressing

The I²C peripheral may operate either by polling, or can be configured to be interrupt driven for both receive and

transmit data.

18.3. UART Controller

The UART peripheral is a configurable peripheral that can support various features and modes of operation:

- Programmable clock selection
- National Instruments PC16550D compatible
- 16-deep transmit and receive FIFO and fractional clock divisor
- Up to 3.125Mbps communication speed (with HCLK = 50MHz)

The UART peripheral may operate either by polling, or can be configured to be interrupt driven for both receive and transmit data.

18.4. SPI Controller

The device contains an SPI controller that can each be used in either master or slave operation, with the following features:

- SPI master operation
 - Control of up to three different SPI slaves
 - ◆ Operation up to 25MHz
 - Flexible multiple transmit mode for variable-size SPI data with user-defined chip-select behavior
 - ◆ Chip select "shaping" through programmable additional delay for chip-select setup, hold and wait time for back-to-back transfers
- SPI master or slave operation
 - Supports clock phase and polarity control
 - ◆ Data transmission/reception can be on 8-, 16-, 24- or 32-bit boundary
 - Selectable data bit ordering (LSB or MSB first)
 - Programmable chip select polarity
 - ◆ Selectable "auto-retransmit" mode

The SPI peripheral may operate either by polling, or can be configured to be interrupt driven for both receive and transmit data.

19. TIMERS

19.1. Block Diagram

Figure 19-1. Timers A, B, C, and D

Figure 19-2. SOC Bus Watchdog and Wake-Up Timer

Figure 19-3. Real-Time Clock and Watchdog Timer

19.2. Functional Description

The device includes 9 timers: timer A, timer B, timer C, timer D, watchdog timer 1 (WDT), watchdog timer 2, wake-up timer, real-time clock (RTC), and SysTick timer. The device supports up to 14 different PWM signals and has up to 7 dead-time controllers. Timers A, B, C and D can be concatenated to synchronize to a single clock and start/stop signal for applications that require a synchronized timer period between timers.

19.2.1. Timer A

Timer A is a general purpose 16-bit timer with 8 PWM/capture and compare units. It has 4 pairs of PWM signals going into 4 dead-time controllers. Timer A can be concatenated with timers B, C, and D to synchronize the PWM/capture and compare units. It can use either ACLK or HCLK as clock input with an additional clock divider from /1 to /128.

19.2.2. Timer B

Timer B is a general purpose 16-bit timer with 2 PWM/capture and compare units. It has one pair of PWM signals going into one dead-time controller, as well as 2 additional compare units that can be used for additional system time bases for interrupts. Timer B can be concatenated with timers A, C, and D to synchronize the PWM/capture and compare units. It can use either ACLK or HCLK as clock input with an additional clock divider from /1 to /128.

19.2.3. Timer C

Timer C is a general purpose 16-bit timer with 2 PWM/capture and compare units. It has one pair of PWM signals going into one dead-time controller. Timer C can be concatenated with timers A, B, and D to synchronize the PWM/capture and compare units. It can use either ACLK or HCLK as clock input with an additional clock divider from /1 to /128.

19.2.4. Timer D

Timer D is a general purpose 16-bit timer with 2 PWM/capture and compare units. It has one pair of PWM signals going into one dead-time controller. Timer D can be concatenated with timers A, B, and C to synchronize the PWM/capture and compare units. It can use either ACLK or HCLK as clock input with an additional clock divider from /1 to /128.

19.2.5. Watchdog Timer

The 24-bit watchdog timer (WDT) can be used for long time period measurements or periodic wake up from sleep mode. The watchdog timer can be used as a system watchdog, or as an interval timer, or both. The watchdog timer can use either FRCLK or FCLK as clock input with an additional clock divider from /2 to /65536.

19.2.6. SOC Bus Watchdog Timer

The watchdog timer 2 is used to monitor internal SOC Bus communication. It will trigger device reset if there is no SOC Bus communication to the AFE for 4s or 8s.

19.2.7. Wake-Up Timer

The wake-up timer can be used for very low power hibernate and sleep modes to wake up the micro controller periodically. It can be configured to be 125ms, 250ms, 500ms, 1s, 2s, 4, or 8s.

19.2.8. Real-Time Clock

The 24-bit real-time clock (RTC) can be used for time measurements when an accurate clock source is used. This timer can also be used for periodic wake up from sleep mode. The RTC uses FRCLK as clock input with an additional clock divider from /2 to /65536.

20. THERMAL CHARACTERISTICS

Table 20-1. Thermal Characteristics

PARAMETER	VALUE	UNIT
Operating ambient temperature range	-40 to 105	°C
Operating junction temperature range	-40 to 125	°C
Storage temperature range	-55 to 150	°C
Lead temperature (Soldering, 10 seconds)	300	°C
Junction-to-case thermal resistance (θ _{JC})	19.0	°C/W
Junction-to-ambient thermal resistance (θ_{JA})	32.2	°C/W
