

ISL9305H

3MHz Dual 1.5A Step-Down Converters and Dual Low-Input LDOs with I²C Compatible Interface

FN7724
Rev 2.00
March 7, 2014

The ISL9305H is an integrated mini Power Management IC (mini-PMIC) for powering low-voltage microprocessors, or applications using a single Li-Ion or Li-Polymer cell battery to power multiple voltage rails. The ISL9305H integrates two high-efficiency 3MHz synchronous step-down converters (DCD1 and DCD2) and two low-input, low-dropout linear regulators (LDO1 and LDO2).

The 3MHz PWM switching frequency allows the use of very small external inductors and capacitors. Both step-down converters can enter skip mode under light load conditions to further improve the efficiency and maximize the battery life. For noise sensitive applications, they can also be programmed through I²C interface to operate in forced PWM mode regardless of the load current condition. The I²C interface supports on-the-fly slew rate control of the output voltage from 0.825V to 3.6V at 25mV/step size for dynamic power saving. Each step-down converter can supply up to 1.5A load current. The default output voltage can be set from 0.8V to V_{IN} using external feedback resistors on the adjustable version, or the ISL9305H can be ordered in factory pre-set voltage options from 0.9V to 3.6V in 50mV step.

The ISL9305H also provides two 300mA low dropout (LDO) regulators. The input voltage range is 1.5V to 5.5V allowing them to be powered from one of the on-chip step-down converters or directly from the battery. The default LDO output comes with factory pre-set fixed output voltage options between 0.9V to 3.3V.

The ISL9305H is available in a 4mmx4mm 16 Ld TQFN package.

Related Literature

- [AN1564](#) "ISL9305 and ISL9305H Evaluation Boards"

Features

- Dual 1.5A, Synchronous Step-down Converters and Dual 300mA, General-purpose LDOs
- Input Voltage Range
 - DCD1/DCD2 2.5V to 5.5V
 - LDO1/LDO2 1.5V to 5.5V
- 400kb/s I²C-Bus Series Interface Transfers the Control Data Between the Host Controller and the ISL9305H
- Adjustable Output Voltage
 - VODCD1/VODCD2 0.8V to V_{IN}
- Fixed Output I²C Programmability
 - At 25mV/Step 0.825V to 3.6V
- LDO1/LDO2 Output Voltage I²C Programmability
 - At 50mV/Step 0.9V to 3.6V
- 50µA I_Q (Typ) with DCD1/DCD2 in Skip Mode; 20µA I_Q (Typ) for Each Enabled LDO
- On-the-fly I²C Programming of DC/DC and LDO Output Voltages
- DCD1/DCD2 I²C Programmable Skip Mode Under Light Load or Forced Fixed Switching Frequency PWM Mode
- Small, Thin 4mmx4mm TQFN Package

Applications

- Cellular Phones, Smart Phones
- PDAs, Portable Media Players, Portable Instruments
- Single Li-Ion/Li-Polymer Battery-Powered Equipment
- DSP Core Power

*Only for adjustable output version. For fixed output version, directly connect the FB pin to the output of the buck converter.

FIGURE 1. TYPICAL APPLICATION DIAGRAM

TABLE 1. TYPICAL APPLICATION PARTS LIST

| PARTS | DESCRIPTION | MANUFACTURER | PART NUMBER | SPECIFICATIONS | SIZE |
|----------------|------------------|--------------|--------------------|------------------|--------------------|
| L1, L2 | Inductor | Sumida | CDRH2D14NP-1R5 | 1.5μH/1.80A/50mΩ | 3.0mmx3.0mmx1.55mm |
| C1 | Input capacitor | Murata | GRM21BR60J106KE19L | 10μF/6.3V | 0805 |
| C2, C3 | Input capacitor | Murata | GRM185R60J105KE26D | 1μF/6.3V | 0603 |
| C4, C5 | Output capacitor | Murata | GRM21BR71A106KE51L | 10μF/6.3V | 0805 |
| C6, C7 | Output capacitor | Murata | GRM185R60J105KE26D | 1μF/6.3V | 0603 |
| R1, R2, R3, R4 | Resistor | Various | | 1%, SMD, 0.1W | 0603 |

Pin Configuration

Pin Descriptions

| PIN NUMBER (TQFN) | NAME | DESCRIPTION |
|-------------------|---------|--|
| 1 | VINDCD1 | Input voltage for buck converter DCD1 and it also serves as the power supply pin for the whole internal digital/analog circuits. |
| 2 | FB1 | Feedback pin for DCD1, connect external voltage divider resistors between DCD1 output, this pin and ground. For fixed output versions, connect this pin directly to the DCD1 output. |
| 3 | SCLK | I ² C interface clock pin. |
| 4 | SDAT | I ² C interface data pin. |
| 5 | VINLD01 | Input voltage for LD01. |
| 6 | VOLDO1 | Output voltage of LD01. |
| 7 | VOLDO2 | Output voltage of LD02. |
| 8 | VINLD02 | Input voltage for LD02. |
| 9 | GNLDLO | Power ground for LD01 and LD02. |
| 10 | DCDPG | The DCDPG pin is an open-drain output to indicate the state of the DCD1/DCD2 output voltages. When both DCD1 and DCD2 are enabled, the output is released to be pulled high by an external pull-up resistor if both converter voltages are within the power good range. The pin will be pulled low if either DCD is outside their range. When only one DCD is enabled, the state of the enabled DCD's output will define the state of the DCDPG pin. The DCDPG state can be programmed for a delay of up to 200ms before being released to rise high. The programming range is 1ms~200ms through the I ² C interface. |

Pin Descriptions (Continued)

| PIN NUMBER (TQFN) | NAME | DESCRIPTION |
|-------------------|---------|--|
| 11 | FB2 | Feedback pin for DCD2, connect external voltage divider resistors between DCD2 output, this pin and ground. For fixed output versions, connect this pin directly to the DCD2 output. |
| 12 | VINDCD2 | Input voltage for buck converter DCD2. |
| 13 | SW2 | Switching node for DCD2, connect to one terminal of the inductor. |
| 14 | GNDDCD2 | Power ground for DCD2. |
| 15 | GNDDCD1 | Power ground for DCD1. |
| 16 | SW1 | Switching node for DCD1, connect to one terminal of the inductor. |
| E-PAD | E-PAD | Exposed Pad. Connect to system ground. |

NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL9305H](#). For more information on MSL please see techbrief [TB363](#).

Absolute Maximum Ratings (Refer to ground)

| | |
|--|---------------|
| SW1, SW2 | -1.5V to 6.5V |
| FB1, FB2 | -0.3V to 3.6V |
| GNDDCD1, GNDDCD2, GNDLDO | -0.3V to 0.3V |
| All Other Pins | -0.3V to 6.5V |
| ESD Ratings | |
| Human Body Model (Tested per JESD22-A114F) | 3.5kV |
| Machine Model (Tested per JESD22-A115-A) | 225V |
| Charged Device Model (Tested per JESD22-C101D) | 2.2kV |
| Latch Up (Tested per JESD78B, Class II, Level A) | 100mA |

Thermal Information

| | | |
|--|---|----------------------|
| Thermal Resistance (Typical) | θ_{JA} (°C/W) | θ_{JC} (°C/W) |
| 16 Ld TQFN Package (Notes 4, 5) | 40.2 | 5 |
| Maximum Junction Temperature Range | -40°C to +150°C | |
| Recommended Junction Temperature Range | -40°C to +125°C | |
| Storage Temperature Range | -40°C to +150°C | |
| Pb-free reflow profile | see link below | |

Recommended Operating Conditions

| | |
|-------------------------------|-----------------|
| VINDCD1 | 2.5V to 5.5V |
| VINDCD2 | 2.5V to VINDCD1 |
| VINLDO1 and VINLDO2 | 1.5V to VINDCD1 |
| DCD1 and DCD2 Output Current | 0A to 1.5A |
| LDO1 and LDO2 Output Current | 0mA to 300mA |
| Operating Ambient Temperature | -40°C to +85°C |

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with “direct attach” features. See Tech Brief TB379.
- θ_{JC} , “case temperature” location is at the center of the exposed metal pad on the package underside.

Electrical Specifications Unless otherwise noted, all parameter limits are guaranteed over the recommended operating conditions and the typical specifications are measured at the following conditions: $T_A = +25^\circ\text{C}$, VINDCD1 = 3.6V, VINDCD2 = 3.3V. For LDO1 and LDO2, VINLDOx = VOLDOx + 0.5V to 5.5V with VINLDOx always no higher than VINDCD1, L1 = L2 = 1.5 μH , C1 = 10 μF , C4 = C5 = 10 μF , C2 = C3 = C6 = C7 = 1 μF , I_{OUT} = 0A for DCD1, DCD2, LDO1 and LDO2 (see “Typical Application Diagram” on page 1 for more details). **Boldface limits apply over the operating temperature range, -40°C to +85°C.**

NOTE:

6. Parameters with MIN and/or MAX limits are 100% tested at $+25^\circ\text{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

Theory of Operation

DCD1 and DCD2 Introduction

Both the DCD1 and DCD2 converters on ISL9305H use the peak-current-mode pulse-width modulation (PWM) control scheme for fast transient response and pulse-by-pulse current limiting. Both converters are able to supply up to 1.5A load current. The default output voltage ranges from 0.8V to 3.6V depending on the factory pre-set configuration and can be programmed via the I²C interface in the range of 0.825V to 3.6V at 25mV/step with a programmable slew rate. An open-drain DCDPG (DCD Power-Good) signal is also provided to monitor the DCD1 and DCD2 output voltages. Optionally, both DCD1 and DCD2 can be programmed to be actively discharged via an on-chip blebbing resistor (typical 115Ω) when the converter is disabled.

Skip Mode (PFM Mode) for DCD1/DCD2

Under light load condition, the DCD1 and DCD2 can be programmed to automatically enter a pulse-skipping mode to minimize the switching loss by reducing the switching frequency. Figure 3 illustrates the skip mode operation. A zero-cross sensing circuit monitors the current flowing through SW node for zero crossing. When it is detected to cross zero for 16 consecutive cycles, the regulator enters the skip mode. During the 16 consecutive cycles, the inductor current could be negative. The counter is reset to zero when the sensed current flowing through the SW node does not cross zero during any cycle within the 16 consecutive cycles. Once the converter enters the skip mode, the pulse modulation is controlled by an internal comparator while each pulse cycle remains synchronized to the PWM clock. The P-Channel MOSFET is turned on at the rising edge of the clock and turned off when its current reaches ~20% of the peak current limit. As the average inductor current in each cycle is higher than the average current of the load, the output voltage rises cycle-over-cycle. When the output voltage is sensed to reach 1.5% above its nominal voltage, the P-Channel MOSFET is turned off immediately and the inductor current is fully discharged to zero and stays at zero. The output voltage reduces gradually due to the load current discharging the output capacitor. When the output voltage drops to the nominal voltage, the P-Channel MOSFET will be turned on again, repeating the previous operations.

FIGURE 3. SKIP MODE OPERATION WAVEFORMS

FIGURE 2. PWM OPERATION WAVEFORMS

The regulator resumes normal PWM mode operation when the output voltage is sensed to drop below 1.5% of its nominal voltage value.

Soft-Start

The soft-start reduces the in-rush current during the start-up stage. The soft-start block limits the current rising speed so that the output voltage rises in a controlled fashion.

Overcurrent Protection

The overcurrent protection for DCD1 and DCD2 is provided on the ISL9305H when an overload condition occurs. When the current at P-Channel MOSFET is sensed to reach the current limit, the internal protection circuit is triggered to turn off the P-Channel MOSFET immediately.

DCD Short-Circuit Protection

The ISL9305H provides Short-Circuit Protection for both DCD1 and DCD2. The feedback voltage is monitored for output short-circuit protection. When the output voltage is sensed to be lower than a certain threshold, the internal circuit will change the PWM oscillator frequency to a lower frequency in order to protect the IC from damage. The P-Channel MOSFET peak current limit remains active during this state.

Undervoltage Lockout (UVLO)

An undervoltage lockout (UVLO) circuit is provided on ISL9305H. The UVLO circuit block can prevent abnormal operation in the event that the supply voltage is too low to guarantee proper operation. The UVLO on VINDCD1 is set for a typical 2.2V with 100mV hysteresis. VINLDO1 and VINLDO2 are set for a typical 1.4V with 50mV hysteresis. When the input voltage is sensed to be lower than the UVLO threshold, the related channel is disabled.

DCDPG (DCD Power-Good)

ISL9305H offers an open-drain Power-Good signal with programmable delay time for monitoring the converters DCD1 and DCD2 output voltage status.

When both DCD1 and DCD2 are enabled and their output voltages are within the power-good window, an internal power-good signal is issued to turn off the open-drain MOSFET so the DCDPG pin voltage can be externally pulled high after a programmed delay time. If either DCD1 or DCD2 output voltages or both of them are not within the power-good window, the DCDPG outputs an open-drain logic low signal after the programmed delay time.

When only one DCD converter (either DCD1 or DCD2) is enabled, then the DCDPG only indicates the status of this active DCD converter. For example, if only DCD1 converter is enabled and DCD2 converter is disabled, when DCD1 output is within the power-good window, an internal power-good signal will be issued to turn off the open-drain MOSFET so the DCDPG pin voltage is externally pulled high after the programmed delay time. If the output voltage of DCD1 is outside the power-good window, the DCDPG outputs an open-drain logic low signal after the programmed delay time. It is similar when only DCD2 is enabled and DCD1 is disabled. When both converters are disabled, DCDPG always outputs the open-drain logic low signal.

Low Dropout Operation

Both DCD1 and DCD2 converters feature the low dropout operation to maximize the battery life. When the input voltage drops to a level that the converter can no longer operate under switching regulation to maintain the output voltage, the P-Channel MOSFET is completely turned on (100% duty cycle). The dropout voltage under such a condition is the product of the load current and the ON-resistance of the P-Channel MOSFET. Minimum required input voltage V_{IN} under such condition is the sum of output voltage plus the voltage drop across the inductor and the P-Channel MOSFET switch.

Active Output Voltage Discharge for DCD1/DCD2

The ISL9305H offers a feature to actively discharge the output voltage of DCD1 and DCD2 via an internal bleeding resistor (typical 115 Ω) when the channel is disabled. This feature is enabled by default, but individual outputs can be disabled through programming the control bit in the DCD_PARAMETER register.

Thermal Shutdown

The ISL9305H provides a built-in thermal protection function with thermal shutdown threshold temperature set at +155 $^{\circ}$ C with +25 $^{\circ}$ C hysteresis (typical). When the die temperature is sensed to reach +130 $^{\circ}$ C, the regulator is completely shut down and as the temperature is sensed to drop to +105 $^{\circ}$ C (typical), the device resumes normal operation starting from the soft-start.

I²C Compatible Interface

The ISL9305H offers an I²C compatible interface, using two pins: SCLK for the serial clock and SDAT for serial data respectively. According to the I²C specifications, a pull-up resistor is needed for the clock and data signals to connect to a positive supply. When the ISL9305 and the host use different supply voltages, the pull-up resistors should be connected to the higher voltage rail.

Signal timing specifications should satisfy the standard I²C bus specification. The maximum bit rate is 400kb/s and more details regarding the I²C specifications can be found from Philips.

I²C Slave Address

The ISL9305H serves as a slave device and the 7-bit default chip address is 1101000, as shown in Figure 4. According to the I²C specifications, here the value of Bit 0 determines the direction of the message ("0" means "write" and "1" means "read").

FIGURE 4. I²C SLAVE ADDRESS

I²C Protocol

Figures 5, 6, and 7 show three typical I²C-bus transaction protocols.

FIGURE 5. I²C WRITE

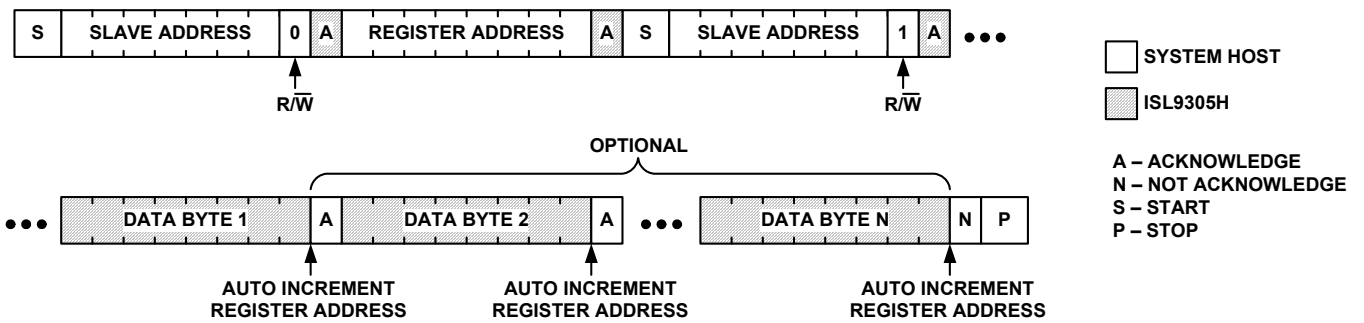

FIGURE 6. I²C READ SPECIFYING REGISTER ADDRESS

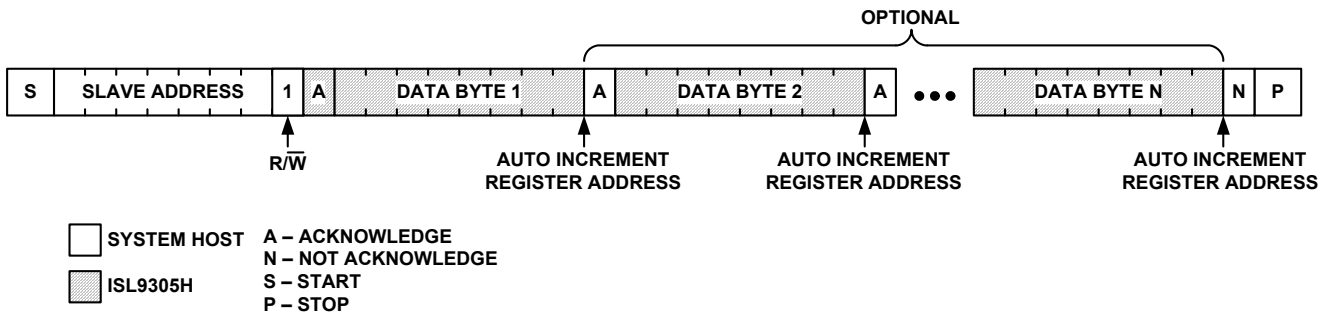

FIGURE 7. I²C READ NOT SPECIFYING REGISTER ADDRESS

I²C Control Registers

All the registers are reset at initial start-up.

DCD OUTPUT VOLTAGE CONTROL REGISTER

DCD1OUT, address 0x00h; DCD2OUT, address 0x01h

The output voltages of the two DC/DC converters at power-up are internally fixed by the IC fuse as dictated by the part number. After power-up, different voltages can be selected (except for the adjustable version) by first writing a desired value to this register. Then write a “1” to Bit 6 of the SYS_PARAMETER (Table 7) to change the voltage control method to I2C control.

TABLE 2. BUCK CONVERTERS OUTPUT VOLTAGE CONTROL REGISTER

| BIT | NAME | ACCESS | DEFAULT | DESCRIPTION |
|-----|-----------|--------|---------|------------------|
| B7 | Reserve | - | 0 | Refer to Table 3 |
| B6 | DCDxOUT-6 | R/W | 0 | |
| B5 | DCDxOUT-5 | R/W | 0 | |
| B4 | DCDxOUT-4 | R/W | 1 | |
| B3 | DCDxOUT-3 | R/W | 0 | |
| B2 | DCDxOUT-2 | R/W | 0 | |
| B1 | DCDxOUT-1 | R/W | 0 | |
| B0 | DCDxOUT-0 | R/W | 0 | |

LDO1 AND LDO2 OUTPUT VOLTAGE CONTROL REGISTERS

LDO1OUT, address 0x02h and LDO2OUT, address 0x03h.

The output voltages of the two LDO's at power-up are internally fixed by the IC fuse as dictated by the part number. After power-up, different voltages can be selected by first writing a desired value to this register. Then write a "1" to Bit 6 of the SYS_PARAMETER (Table 7) to change the voltage control method to I2C control.

TABLE 4. LDOX OUTPUT VOLTAGE CONTROL REGISTERS

| BIT | NAME | ACCESS | DEFAULT | DESCRIPTION |
|-----|-----------|--------|---------|--|
| B7 | Reserve | - | 0 | Refer to Table 5 for output voltage settings |
| B6 | Reserve | - | 0 | |
| B5 | LDOxOUT-5 | R/W | 0 | |
| B4 | LDOxOUT-4 | R/W | 0 | |
| B3 | LDOxOUT-3 | R/W | 1 | |

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support

Package Outline Drawing

L16.4x4G

16 LEAD THIN QUAD FLAT NO-LEAD PLASTIC PACKAGE

Rev 0, 4/10

NOTES:

1. Dimensions are in millimeters.
Dimensions in () for Reference Only.
2. Dimensioning and tolerancing conform to ASME Y14.5m-1994.
3. Unless otherwise specified, tolerance : Decimal ± 0.05
4. Dimension applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.
5. Tiebar shown (if present) is a non-functional feature.
6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.
7. JEDEC reference drawing: MO220K.
