

BROADCAST MECHANICAL TUNING AM/FM/SW RADIO RECEIVER

Features

- Worldwide FM band support (64–109 MHz)
- Worldwide AM band support (504–1750 kHz)
- SW band support (Si4824 only) (5.6–22 MHz)
- No manual alignment necessary
- Mono audio output
- Selectable support AM/FM/SW regional bands
- Automatic frequency control (AFC)
- Integrated LDO regulator
- 2.0 to 3.6 V supply voltage
- Wide range of ferrite loop sticks and air loop antennas supported
- 24-pin SSOP
- RoHS-compliant
- Direct volume control
- Not EN55020 compliant*

***Note:** For consumer applications that require EN 55020 compliance, use Si4831/35-B.

Applications

- Table and portable radios
- Mini/micro systems
- CD/DVD players
- Boom boxes
- Modules
- Clock radios
- Mini HiFi
- Entertainment systems

Description

The Si4820/24-A10 is the entry level mechanical-tuned digital CMOS AM/FM/SW radio receiver IC that integrates the complete receiver function from antenna input to audio output. The Si4820/24-A10 extends Silicon Laboratories multi-band tuner family, and further increases the ease and attractiveness of design radio reception to audio devices through small size and board area, minimum component count, and superior, proven performance. The Si4820/24-A10 is drop-in replaceable to the existing Si4831/35 tuner, requires a simple application circuit, and removes any requirements for manually tuning components during the manufacturing process. It is a very simple product to design, manufacture, and support across multiple product lines. The receiver has very low power consumption, runs off two AAA batteries, and delivers the performance benefits of digital tuning to the analog radio market.

Notes:

1. Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as specified in the operational sections of this data sheet. Exposure beyond recommended operating conditions for extended periods may affect device reliability.
2. The Si4820/24-A10 devices are high-performance RF integrated circuits with certain pins having an ESD rating of < 2 kV HBM. Handling and assembly of these devices should only be done at ESD-protected workstations.
3. For input pins RST, VOL+, VOL-, XTALO, XTALI, BAND, TUNE2, TUNE1, LNA_EN.
4. At RF input pins, FMI and AMI.

2. Typical Application Schematic

Notes:

1. Place C_4 close to V_{DD2} and DBYP pins.
2. All grounds connect directly to GND plane on PCB.
3. Pin 6, pin 7, and pin 23 leave floating.
4. To ensure proper operation and receiver performance, follow the guidelines in "AN555: Si483x-B/Si4820/24 Antenna, Schematic, Layout, and Design Guidelines." Silicon Labs will evaluate the schematics and layouts for qualified customers.
5. Pin 8 connects to the FM antenna interface and pin 12 connects to the AM antenna interface.
6. Place Si4820/24 as close as possible to antenna jack and keep the FMI and AMI traces as short as possible.
7. Recommend keeping the AM ferrite loop antenna at least 5 cm away from the MCU, audio AMP, and other circuits which have AM interference.
8. Keep the AM ferrite loop antenna at least 5 cm away from MCU, audio AMP, and other circuits which have AM interference.
9. Place the transformer T1 away from any sources of interference and even away from the I/O signals of the Si4820/24.

4. Functional Description

Figure 2. Si4820/24-A10 Functional Block Diagram

4.1. Overview

The Si4820/24-A10 is the entry level mechanical-tuned digital CMOS AM/FM/SW radio receiver IC that integrates the complete receiver function from antenna input to audio output. The Si4820/24-A10 extends Silicon Laboratories multi-band tuner family, and further increases the ease and attractiveness of design radio reception to audio devices through small size and board area, minimum component count, and superior, proven performance. The Si4820/24-A10 is drop-in replaceable to the existing Si4831/35 tuner, requires a simple application circuit, and removes any requirements for manually tuning components during the manufacturing process. It is a very simple product to design, manufacture, and support across multiple product lines.

Leveraging Silicon Laboratories' proven and patented digital low intermediate frequency (low-IF) receiver architecture, the Si4820/24-A10 delivers desired RF performance and interference rejection in AM, FM, and SW bands. The high integration and complete system production test simplifies design-in, increases system quality, and improves manufacturability.

4.2. FM Receiver

The Si4820/24-A10 integrates a low noise amplifier (LNA) supporting the worldwide FM broadcast band (64 to 109 MHz).

Pre-emphasis and de-emphasis is a technique used by FM broadcasters to improve the signal-to-noise ratio of FM receivers by reducing the effects of high frequency interference and noise. When the FM signal is transmitted, a pre-emphasis filter is applied to accentuate the high audio frequencies. All FM receivers incorporate a de-emphasis filter which attenuates high frequencies to restore a flat frequency response. Two time constants are used in various regions. The de-emphasis time constant can be chosen to be 50 or 75 μ s.

4.3. AM Receiver

The highly integrated Si4820/24-A10 supports worldwide AM band reception from 504 to 1750 kHz with five sub-bands using a digital low-IF architecture with a minimum number of external components and no manual alignment required. This patented architecture allows for high-precision filtering, offering excellent selectivity and SNR with minimum variation across the AM band. Similar to the FM receiver, the Si4820/24-A10 optimizes sensitivity and rejection of strong interferers, allowing better reception of weak stations.

To offer maximum flexibility, the receiver supports a wide range of ferrite loop sticks from 180–450 μ H. An air loop antenna is supported by using a transformer to increase the effective inductance from the air loop. Using a 1:5 turn ratio inductor, the inductance is increased by 25 times and easily supports all typical AM air loop antennas, which generally vary between 10 and 20 μ H.

4.4. SW Receiver

The Si4824 supports 16 short wave (SW) band receptions from 5.60 to 22.0 MHz. Si4824 supports extensive short wave features such as minimal discrete components and no factory adjustments. The Si4824 supports using the FM antenna to capture short wave signals.

4.5. Frequency Tuning

A valid channel can be found by tuning the potentiometer that is connected to the TUNE1 and TUNE2 pin of the Si4820/24-A10 chip.

To offer easy tuning, the Si4820/24-A10 also supports a station LED light. It will light up the LED if the RF signal quality passes the LED sensitivity threshold when tuned to a valid station.

4.6. Band Select

The Si4820/24-A10 supports worldwide AM band with five sub-bands, US/Europe/Japan/China FM band with five sub-bands, and SW band with 16 sub-bands. For details on band selection, refer to "AN555: Si483x-B/Si4820/24 Antenna, Schematic, Layout, and Design Guidelines."

4.7. Volume Control

The Si4820/24-A10 not only allows customers to use the traditional PVR wheel volume control through an external speaker amplifier, it also supports direct digital volume control through pins 16 and pin 17 by using volume up and down buttons. Refer to "AN555: Si483x-B/Si4820/24 Antenna, Schematic, Layout, and Design Guidelines."

Notes:

1. Add an "(R)" at the end of the device part number to denote tape and reel option. The devices will typically operate at 25 °C with degraded specifications for V_{DD} voltage ramped down to 2.0 V.
2. The -C suffix in the part number indicates Consumer Grade product. Please visit www.silabs.com to get more information on product grade specifications.

7. Package Outline: Si4820/24-A10

| E | 0.635 BSC | |
| X1 | 0.35 | 0.45 |
| Y1 | 1.55 | 1.75 |

General:

- All dimensions shown are in millimeters (mm) unless otherwise noted.
- This land pattern design is based on the IPC-7351 guidelines.

Solder Mask Design:

- All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Stencil Design:

- A stainless steel, laser-cut, and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
- The stencil thickness should be 0.125 mm (5 mils).
- The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.

Card Assembly:

- A No-Clean, Type-3 solder paste is recommended.
- The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.
