

FEATURES

Low offset voltage (maximum specifications)

B-Grade: 25 μV (SOIC)

A-Grade: 50 μV (SOIC), 90 μV (MSOP)

Very low offset voltage drift

B-Grade: 0.25 $\mu\text{V}/^\circ\text{C}$ (SOIC)

A-Grade: 0.55 $\mu\text{V}/^\circ\text{C}$ (SOIC) and 1.2 $\mu\text{V}/^\circ\text{C}$ (MSOP), specified over -40°C to $+125^\circ\text{C}$, MSL1 rated

Low input bias current: 1.0 nA maximum

Low noise: 7 nV/ $\sqrt{\text{Hz}}$ typical

CMRR, PSRR, and A_{VO} > 120 dB minimum

Low supply current: 400 μA per amplifier typical

Wide bandwidth: 4.0 MHz

Dual-supply operation: $\pm 5\text{ V}$ to $\pm 15\text{ V}$

Unity-gain stable

No phase reversal

APPLICATIONS

Process control front-end amplifiers

Wireless base station control circuits

Optical network control circuits

Instrumentation

Sensors and controls: thermocouples, resistor thermal detectors (RTDs), strain bridges, and shunt current measurements

Precision filters

GENERAL DESCRIPTION

The ADA4077-2 is a dual amplifier featuring extremely low offset voltage and drift and low input bias current, noise, and power consumption. Outputs are stable with capacitive loads of more than 1000 pF with no external compensation.

Applications for this amplifier include sensor signal conditioning (such as thermocouples, RTDs, strain gauges), process control front-end amplifiers, and precision diode power measurement in optical and wireless transmission systems. The ADA4077-2 is useful in line powered and portable instrumentation, precision filters, and voltage or current measurement and level setting.

Unlike the amplifiers of some competitors, the ADA4077-2 is specified over the extended industrial temperature range for operation from -40°C to $+125^\circ\text{C}$ with MSL1 rating for the most demanding operating environments. It is available in 8-lead SOIC (including the B-Grade) and MSOP (A-Grade only) packages.

ABSOLUTE MAXIMUM RATINGS

Table 4.

Parameter	Rating
Supply Voltage	36 V
Input Voltage	$\pm V_{SY}$
Differential Input Voltage	$\pm V_{SY}$
Storage Temperature Range	
MSOP and SOIC_N Packages	-65°C to +150°C
Operating Temperature Range	-40°C to +125°C
Junction Temperature Range	
R and RM Packages	-65°C to +150°C
Lead Temperature, Soldering (10 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

Table 5. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit

THEORY OF OPERATION

The [ADA4077-2](#) is the sixth generation of the Analog Devices, Inc., industry-standard [OP07](#) amplifier family. The [ADA4077-2](#) is a high precision, low noise operational amplifier with a combination of extremely low offset voltage and very low input bias currents. Unlike JFET amplifiers, the low bias and offset currents are relatively insensitive to ambient temperatures, even up to 125°C.

The Analog Devices proprietary process technology and linear design expertise have produced a high voltage amplifier with superior performance to the [OP07](#), [OP77](#), [OP177](#), and [OP1177](#) in tiny, 8-lead SOIC and 8-lead MSOP packages. Despite its small size, the [ADA4077-2](#) offers numerous improvements, including low wideband noise, wide bandwidth, lower offset and offset drift, lower input bias current, and complete freedom from phase inversion.

The [ADA4077-2](#) has a specified operating temperature range of –40°C to +125°C with a MSL1 rating, which is as wide as any similar device in a plastic surface-mount package. This is increasingly important as PCB and overall system sizes continue to shrink, causing internal system temperatures to rise.

In the [ADA4077-2](#), power consumption is reduced by a factor of four from the [OP177](#), and bandwidth and slew rate have both increased by a factor of six. The low power dissipation and very stable performance vs. temperature also act to reduce warm-up drift errors to insignificant levels.

Inputs are protected internally from overvoltage conditions referenced to either supply rail. Like any high performance amplifier, maximum performance is achieved by following appropriate circuit and PCB guidelines.

APPLICATIONS INFORMATION

OUTPUT PHASE REVERSAL

Phase reversal is defined as a change of polarity in the amplifier transfer function. Many operational amplifiers exhibit phase reversal when the voltage applied to the input is greater than the maximum common-mode voltage. In some instances, this can cause permanent damage to the amplifier. In feedback loops, it can result in system lockups or equipment damage. The ADA4077-2 is immune to phase reversal problems even at input voltages beyond the supplies.

Figure 59. No Phase Reversal

LOW POWER LINEARIZED RTD

A common application for a single element varying bridge is an RTD thermometer amplifier, as shown in Figure 60. The excitation is delivered to the bridge by a 2.5 V reference applied at the top of the bridge.

RTDs can have a thermal resistance as high as 0.5°C to 0.8°C per mW. To minimize errors due to resistor drift, the current through each leg of the bridge must be kept low. In this circuit, the amplifier supply current flows through the bridge. However, at the ADA4077-2 maximum supply current of 500 μ A, the RTD dissipates less than 0.1 mW of power, even at the highest resistance. Errors due to power dissipation in the bridge are kept under 0.1°C.

Calibration of the bridge is made at the minimum value of the temperature to be measured by adjusting RP until the output is zero.

To calibrate the output span, set the full-scale and linearity potentiometers to midpoint and apply a 500°C temperature to the sensor or substitute the equivalent 500°C RTD resistance.

Adjust the full-scale potentiometer for a 5 V output. Finally, apply 250°C or the equivalent RTD resistance and adjust the linearity potentiometer for 2.5 V output. The circuit achieves better than $\pm 0.5^\circ\text{C}$ accuracy after adjustment.

Figure 60. Low Power Linearized RTD Circuit

PROPER BOARD LAYOUT

The ADA4077-2 is a high precision device. To ensure optimum performance at the PCB level, care must be taken in the design of the board layout.

To avoid leakage currents, maintain a clean and moisture-free board surface. Coating the surface creates a barrier to moisture accumulation and helps reduce parasitic resistance on the board.

Keeping supply traces short and properly bypassing the power supplies minimizes power supply disturbances caused by output current variation, such as when driving an ac signal into a heavy load. Connect bypass capacitors as closely as possible to the device supply pins. Stray capacitances are a concern at the outputs and the inputs of the amplifier. It is recommended that signal traces be kept at least 5 mm from supply lines to minimize coupling.

A variation in temperature across the PCB can cause a mismatch in the Seebeck voltages at solder joints and other points where dissimilar metals are in contact, resulting in thermal voltage errors. To minimize these thermocouple effects, orient resistors so heat sources warm both ends equally. Input signal paths should contain matching numbers and types of components, where possible, to match the number and type of thermocouple junctions. For example, dummy components such as zero value resistors can be used to match real resistors in the opposite input path. Place matching components in close proximity to each other and orient them in the same manner. Ensure that leads are of equal length so that thermal conduction is in equilibrium. Keep heat sources on the PCB as far away from amplifier input circuitry as is practical.

The use of a ground plane is highly recommended. A ground plane reduces EMI noise and helps to maintain a constant temperature across the circuit board.
