

## 3.3V ZERO DELAY CLOCK BUFFER

**IDT2309A**

### FEATURES:

- Phase-Lock Loop Clock Distribution
- 10MHz to 133MHz operating frequency
- Distributes one clock input to one bank of five and one bank of four outputs
- Separate output enable for each output bank
- Output Skew < 250ps
- Low jitter < 200 ps cycle-to-cycle
- IDT2309A-1 for Standard Drive
- IDT2309A-1H for High Drive
- No external RC network required
- Operates at 3.3V V<sub>DD</sub>
- Available in SOIC and TSSOP packages

### DESCRIPTION:

The IDT2309A is a high-speed phase-lock loop (PLL) clock buffer, designed to address high-speed clock distribution applications. The zero delay is achieved by aligning the phase between the incoming clock and the output clock, operable within the range of 10 to 133MHz.

The IDT2309A is a 16-pin version of the IDT2305A. The IDT2309A accepts one reference input, and drives two banks of four low skew clocks. The -1H version of this device operates up to 133MHz frequency and has higher drive than the -1 device. All parts have on-chip PLLs which lock to an input clock on the REF pin. The PLL feedback is on-chip and is obtained from the CLKOUT pad. In the absence of an input clock, the IDT2309A enters power down. In this mode, the device will draw less than 12μA for Commercial Temperature range and less than 25μA for Industrial temperature range, and the outputs are tri-stated.

The IDT2309A is characterized for both Industrial and Commercial operation.

| V <sub>DD</sub>                                         | Supply Voltage Range             | -0.5 to +4.6                 | V    |
| V <sub>I</sub> <sup>(2)</sup>                           | Input Voltage Range (REF)        | -0.5 to +5.5                 | V    |
| V <sub>I</sub>                                          | Input Voltage Range (except REF) | -0.5 to V <sub>DD</sub> +0.5 | V    |
| I <sub>IK</sub> (V <sub>I</sub> < 0)                    | Input Clamp Current              | -50                          | mA   |
| I <sub>O</sub> (V <sub>O</sub> = 0 to V <sub>DD</sub> ) | Continuous Output Current        | ±50                          | mA   |
| V <sub>DD</sub> or GND                                  | Continuous Current               | ±100                         | mA   |
| T <sub>A</sub> = 55°C (in still air) <sup>(3)</sup>     | Maximum Power Dissipation        | 0.7                          | W    |
| T <sub>STG</sub>                                        | Storage Temperature Range        | -65 to +150                  | °C   |
| Operating Temperature                                   | Commercial Temperature Range     | 0 to +70                     | °C   |
| Operating Temperature                                   | Industrial Temperature Range     | -40 to +85                   | °C   |

### NOTES:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
3. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 750 mils.

## PIN DESCRIPTION

| Pin Name              | Pin Number | Type | Functional Description                       |
|-----------------------|------------|------|----------------------------------------------|
| REF                   | 1          | IN   | Input reference clock, 5 Volt tolerant input |
| CLKA1 <sup>(1)</sup>  | 2          | Out  | Output clock for bank A                      |
| CLKA2 <sup>(1)</sup>  | 3          | Out  | Output clock for bank A                      |
| V <sub>DD</sub>       | 4, 13      | PWR  | 3.3V Supply                                  |
| GND                   | 5, 12      | GND  | Ground                                       |
| CLKB1 <sup>(1)</sup>  | 6          | Out  | Output clock for bank B                      |
| CLKB2 <sup>(1)</sup>  | 7          | Out  | Output clock for bank B                      |
| S2 <sup>(2)</sup>     | 8          | IN   | Select input Bit 2                           |
| S1 <sup>(2)</sup>     | 9          | IN   | Select input Bit 1                           |
| CLKB3 <sup>(1)</sup>  | 10         | Out  | Output clock for bank B                      |
| CLKB4 <sup>(1)</sup>  | 11         | Out  | Output clock for bank B                      |
| CLKA3 <sup>(1)</sup>  | 14         | Out  | Output clock for bank A                      |
| CLKA4 <sup>(1)</sup>  | 15         | Out  | Output clock for bank A                      |
| CLKOUT <sup>(1)</sup> | 16         | Out  | Output clock, internal feedback on this pin  |

### NOTES:

1. Weak pull down on all outputs.
2. Weak pull ups on these inputs.

## FUNCTION TABLE<sup>(1)</sup>

| S2 | S1 | CLKA      | CLKB      | CLKOUT <sup>(2)</sup> | Output Source | PLL Shut Down |
|----|----|-----------|-----------|-----------------------|---------------|---------------|
| L  | L  | Tri-State | Tri-State | Driven                | PLL           | N             |
| L  | H  | Driven    | Tri-State | Driven                | PLL           | N             |
| H  | L  | Driven    | Driven    | Driven                | REF           | Y             |
| H  | H  | Driven    | Driven    | Driven                | PLL           | N             |

### NOTES:

- H = HIGH Voltage Level.  
L = LOW Voltage Level
- This output is driven and has an internal feedback for the PLL. The load on this output can be adjusted to change the skew between the REF and the output.

## DC ELECTRICAL CHARACTERISTICS - COMMERCIAL

### NOTES:

1. REF Input has a threshold voltage of V<sub>DD</sub>/2.
2. All parameters specified with loaded outputs.

## ZERO DELAY AND SKEW CONTROL

All outputs should be uniformly loaded in order to achieve Zero I/O Delay. Since the CLKOUT pin is the internal feedback for the PLL, its relative loading can affect and adjust the input/output delay. The Output Load Difference diagram illustrates the PLL's relative loading with respect to the other outputs that can adjust the Input-Output (I/O) Delay.

For designs utilizing zero I/O Delay, all outputs including CLKOUT must be equally loaded. Even if the output is not used, it must have a capacitive load equal to that on the other outputs in order to obtain true zero I/O Delay. For zero output-to-output skew, all outputs must be loaded equally.
