Functional Description

CY7C1062G and CY7C1062GE are high-performance CMOS fast static RAM devices with embedded ECC. Both have three chip enables, giving easy memory expansion features. The CY7C1062GE device includes an error indication pin that signals the host processor in the case of a single bit error-detection and correction event.

To write to the device, take Chip Enables ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW) and Write Enable ($\overline{WE}$) input LOW. If Byte Enable A ($\overline{B}_A$) is LOW, then data from I/O pins (I/O_0 through I/O_7) is written into the location specified on the address pins (A_0 through A_{18}). If Byte Enable B ($\overline{B}_B$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{18}). Likewise, $\overline{B}_C$ and $\overline{B}_D$ correspond with the I/O pins I/O_{16} to I/O_{23} and I/O_{24} to I/O_{31} , respectively.

To read from the device, take Chip Enables ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If the first $\overline{B}_A$ is LOW, then data from the memory location specified by the address pins appear on I/O_0 to I/O_7 . If $\overline{B}_B$ is LOW, then data from memory appears on I/O_8 to I/O_{15} . Likewise, $\overline{B}_C$ and $\overline{B}_D$ correspond to the third and fourth bytes. See [Truth Table – CY7C1062G/CY7C1062GE on page 15](#) for a complete description of read and write modes.

The input and output pins (I/O_0 through I/O_{31}) are placed in a high-impedance state when the device is deselected ($\overline{CE}_1$, $\overline{CE}_2$, or $\overline{CE}_3$ HIGH), the outputs are disabled ($\overline{OE}$ HIGH), the byte selects are disabled ($\overline{B}_{A-D}$ HIGH), or during a write operation ($\overline{CE}_1$, $\overline{CE}_2$ and $\overline{CE}_3$ LOW and $\overline{WE}$ LOW).

On the CY7C1062GE device, the detection and correction of a single-bit error in the accessed location is indicated by the assertion of the ERR output (ERR = High)^[1].

CY7C1062G and CY7C1062GE devices are available in Pb-free 119-ball plastic ball grid array (PBGA) package.

Notes

13. Test conditions assume signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for V_{CC} ≥ 3 V) and V_{CC}/2 (for V_{CC} < 3 V), and input pulse levels of 0 to 3 V (for V_{CC} ≥ 3 V) and 0 to V_{CC} (for V_{CC} < 3V). Test conditions for the read cycle use output loading shown in part (a) of Figure 3 on page 7, unless specified otherwise.

14. t_{POWER} gives minimum amount of time that the power supply is at stable V_{CC} until first memory access is performed.

15. These parameters are guaranteed by design and are not tested.

16. CE indicates a combination of all three chip enables. When active LOW, CE indicates the CE₁, CE₂ and CE₃ LOW. When HIGH, CE indicates the CE₁, CE₂ or CE₃ HIGH.

17. t_{HZOE}, t_{HZCE}, t_{HZWE}, t_{LZOE}, t_{LZCE}, t_{LZWE}, and t_{LZBE} are specified with a load capacitance of 5 pF as in (b) of Figure 3 on page 7. Transition is measured ±200 mV from steady state voltage.

18. Tested initially and after any design or process changes that may affect these parameters.

19. The internal write time of the memory is defined by the overlap of WE = V_{IL}, CE = V_{IL}. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.

20. The minimum write pulse width for Write Cycle No. 2 (WE Controlled, OE Low) should be sum of t_{HZWE} and t_{SD}.

ERR Output – CY7C1062GE

Output ^[40]	Mode
0	Read Operation, no single-bit error in the stored data.
1	Read Operation, single bit error detected and corrected.
High Z	Device deselected or Outputs disabled or Write Operation.

Notes

39. The input voltage levels on these pins should be either at V_{IH} or V_{IL}.

40. ERR is an Output pin. If not used, this pin should be left floating.
