

USB-OTG BUS-Port ESD-Protection for $V_{BUS} = 12\text{ V}$

MARKING (example only)

Dot = Pin 1 marking

XX = Date code

YY = Type code (see table below)

FEATURES

- Ultra compact LLP75-7L package
- Low package height < 0.6 mm
- 3-line USB ESD-protection with max. working range = 5.5 V
- V_{BUS} - protection with 12 V working range
- Low leakage current
- Low load capacitance $C_D = 0.7\text{ pF}$
- ESD-protection to IEC 61000-4-2
± 15 kV contact discharge
± 15 kV air discharge
- Surge current acc. IEC 61000-4-5 $I_{PP} > 3\text{ A}$
- e4 - precious metal (e.g. Ag, Au, NiPd, NiPdAu) (no Sn)
- Compliant to RoHS Directive 2002/95/EC and in accordance to WEEE 2002/96/EC

APPLICATION NOTE

The VBUS053AZ-HAF is intended as an ESD-protection and transient voltage suppressor for one USB-OTG port.

The LLP75-7L package contains two separate dies which are mounted on a common ground plane (pin 7). The high-speed data lines D-, D+ and ID, are connected to any of the pins no. 1 to 3. As long as the signal voltage on the data lines is between the ground- and the 5 V working range, the low capacitance PN-diodes offer a very high isolation to ground and to the other data lines. But as soon as any transient signal like an ESD-signal, exceeds this working range of 5 V in either the positive or negative direction, one of the PN-diodes gets into the forward mode and clamps the transient either to ground or to the avalanche break through level. An extra avalanche diode (separate die) clamps the supply line voltage (V_{BUS} at pin 6) above the 12 V working range to ground (pin 7).

Due to the "two die construction" the V_{BUS} line has a very high isolation to the data lines. In case of a destructive transient signal, i.e. coming from a charger, the data lines will not be influenced.

Remark:

The input pins no. 1, 2 and 3 are symmetrical. Each of the data signals D-, D+ and ID can be connected to pin 1, 2 or 3.
