### Overview

The LC87F2608A is an 8-bit microcontroller that, centered around a CPU running at a minimum bus cycle time of 100ns, integrates on a single chip a number of hardware features such as 8K-byte flash ROM, 512-byte RAM, an on-chip debugger, two sophisticated 16-bit timers/counters (may be divided into 8-bit timers), a synchronous SIO interface, a high-speed 12-bit PWM, two high-speed pulse width/period counters, a 3-channel AD converter with 12-/8-bit resolution selector, an analog comparator, a watchdog timer, an internal reset circuit, a system clock frequency divider, and a 16-source 10-vector interrupt feature.

### Features

#### ■ Flash ROM

- 8192 × 8 bits (LC87F2608A)
- Capable of on-board-programming with wide range of voltage source (3.0 to 5.5V).
- Block-erasable in 128-byte units

#### ■ RAM

- 512 × 9 bits (LC87F2608A)

#### ■ Package Form

- MFP10SK: Lead-/Halogen-free type
- MFP14S (for debugging only): Lead-free type
- MFP10S: Lead-/Halogen-free type (discontinued)

**■ Minimum Bus Cycle Time (Note1)**

- 100ns (10MHz)  $V_{DD}=2.7$  to 5.5V (Note2)

**■ Minimum Instruction Cycle Time**

- 300ns (10MHz)  $V_{DD}=2.7$  to 5.5V (Note2)

Note1: The bus cycle time here refers to the ROM read speed.

Note2: Use this product in a voltage range of 3.0 to 5.5V because the minimum release voltage (PORRL) of the power-on reset (POR) circuit is  $2.87V \pm 0.12V$ .

**■ Ports**

- I/O ports

Ports whose I/O direction can be designated in 1 bit units: 7 (P10 to P12, P30 to P33)

- Reset pins: 1 ( $\overline{RES}$ )
- Power pins: 2 ( $V_{SS1}$ ,  $V_{DD1}$ )

**■ Timers**

- Timer 0: 16-bit timer/counter with a capture register

Mode 0: 8-bit timer with an 8-bit programmable prescaler (with an 8-bit capture register)  $\times 2$  channels

Mode 1: 8-bit timer with an 8-bit programmable prescaler (with an 8-bit capture register)  
+ 8-bit counter (with an 8-bit capture register)

Mode 2: 16-bit timer with an 8-bit programmable prescaler (with a 16-bit capture register)

Mode 3: 16-bit counter (with a 16-bit capture register)

- Timer 1: 16-bit timer/counter

Mode 0: 8-bit timer with an 8-bit prescaler + 8-bit timer/counter with an 8-bit prescaler

Mode 2: 16-bit timer/counter with an 8-bit prescaler

**■ Serial Interface**

- SIO7: 8-bit synchronous serial interface

1) LSB first/MSB first mode selectable

2) Built-in 8-bit baudrate generator (maximum transfer clock cycle =  $4/3$  tCYC)

**■ High-speed 12-bit PWM**

- System clock/high-speed RC oscillation clock (20MHz or 40MHz) operation selectable
- Duty/period programmable
- Continuous PWM output/specific count PWM output (automatic stop) selectable

**■ High-speed Pulse Width/Period Counter**

- HCT1: High-speed pulse width/period counter 1

1) System clock/high-speed RC oscillation clock (20MHz or 40MHz) operation selectable

2) H-level width/L-level width/period measurement modes selectable

3) Input triggering noise filter

- HCT2: High-speed pulse width/period counter 2

1) System clock/high-speed RC oscillation clock (20MHz or 40MHz) operation selectable

2) Can measure both L-level width and period simultaneously.

3) Input triggering noise filter

4) Input trigger selectable (from 3 signals, i.e., P11/HCT2IN, P31/HCT2IN, and analog comparator output)

## ■ AD Converter: 12 bits × 3 channels

- 12-/8-bit AD converter resolution selectable

## ■ Analog Comparator

- Sends output to the P32/CMPO port (polarity selectable).
- Edge detection function (shared with INTC and also allows the selection of the noise filter function)

## ■ Watchdog Timer

- Can generate the internal reset signal on a timer overflow monitored by the WDT-dedicated low-speed RC oscillation clock (30kHz).
- Allows selection of continue, stop, or hold mode operation of the counter on entry into the HALT/ HOLD mode.

## ■ Interrupt Source Flags

- 16 sources, 10 vector addresses
  - 1) Provides three levels (low (L), high (H), and highest (X)) of multiplex interrupt control.  
Any interrupt requests of the level equal to or lower than the current interrupt are not accepted.
  - 2) When interrupt requests to two or more vector addresses occur at the same time,  
the interrupt of the highest level takes precedence over the other interrupts.  
For interrupts of the same level, the interrupt into the smallest vector address takes precedence.

No.	Vector Address	Level	Interrupt Source
1	00003H	X or L	INTA
2	0000BH	X or L	INTB
3	00013H	H or L	INTC/T0L/INTE
4	0001BH	H or L	INTD/INTF
5	00023H	H or L	T0H/SIO7
6	0002BH	H or L	T1L/T1H
7	00033H	H or L	HCT1
8	0003BH	H or L	HCT2
9	00043H	H or L	ADC/HPWM automatic stop/HPWM cycle
10	0004BH	H or L	None

- Priority levels  $X > H > L$
- Of interrupts of the same level, the one with the smallest vector address takes precedence.

## ■ Subroutine Stack Levels: 256 levels maximum (The stack is allocated in RAM.)

## ■ High-speed Multiplication/Division Instructions

- 16 bits × 8 bits (5 tCYC execution time)
- 24 bits × 16 bits (12 tCYC execution time)
- 16 bits ÷ 8 bits (8 tCYC execution time)
- 24 bits ÷ 16 bits (12 tCYC execution time)

## ■ Oscillation Circuits

- Medium speed RC oscillation circuit (internal): For system clock (1MHz)
- Low speed RC oscillation circuit (internal): For watchdog timer (30kHz)
- High speed RC oscillation circuit (internal): For system clock (20MHz or 40MHz)
  - 1) 2 source oscillation frequencies (20MHz or 40MHz) selectable for the high-speed RC oscillation circuit by optional configuration.

## ■ System Clock Divider Function

- Can run on low current.
- The minimum instruction cycle selectable from 300ns, 600ns, 1.2μs, 2.4μs, 4.8μs, 9.6μs, 19.2μs, 38.4μs, and 76.8μs (when high speed RC oscillation is selected for system clock.).

### ■ Internal Reset Circuit

- Power-on reset (POR) function
  - 1) POR reset is generated only at power-on time.
  - 2) The POR release level can be selected from 3 levels (2.87V, 3.86V, and 4.35V) by optional configuration.
- Low-voltage detection reset (LVD) function
  - 1) LVD and POR functions are combined to generate resets when power is turned on and when power voltage falls below a certain level.
  - 2) The use or disuse of the LVD function and the low voltage threshold level (3 levels: 2.81V, 3.79V, and 4.28V) can be selected by optional configuration.

### ■ Standby Function

- HALT mode: Halts instruction execution while allowing the peripheral circuits to continue operation.
  - 1) Oscillation is not halted automatically.
  - 2) There are the following three ways of resetting the HALT mode.
    - (1) Setting the Reset pin to the low level
    - (2) Generating a reset signal via the watchdog timer or brown-out detector
    - (3) Having an interrupt generated
- HOLD mode: Suspends instruction execution and the operation of the peripheral circuits.
  - 1) The medium- and high-speed RC oscillation circuits automatically stop operation.
  - 2) There are the following four ways of resetting the HOLD mode.
    - (1) Setting the Reset pin to the low level
    - (2) Generating a reset signal via the watchdog timer or brown-out detector
    - (3) Setting at least one of the INTA, INTB, INTC, INTD, INTE, and INTF pins to the specified level  
(INTA and INTB HOLD mode reset is available only when level detection is set.)
    - (4) Applying input signals to the IN+ and IN- pins so that the analog comparator output is set to the specified level  
(when the analog comparator output is assigned to the INTC input)

### ■ On-chip Debugger Function

- Supports software debugging with the IC mounted on the target board (selectable from 3 series).
  - 1) LC87D2708A : All terminal function of LC87F2608A can be used.
  - 2) LC87F2708A : All terminal function of LC87F2608A can be used. The debug feature is limited.
  - 3) LC87F2608A : The debugger terminal function when an On-chip debugger is used cannot be used.  
The debug feature is limited.
- Two channels of on-chip debugger pins are available (LC87F2608A).

### ■ Data Security Function (Note3)

- Protects the program data stored in flash memory from unauthorized read or copy.

Note3: This data security function does not necessarily provide absolute data security.

Note 7-1: The quantization error ( $\pm 1/2LSB$ ) is excluded from the absolute accuracy. The absolute accuracy is measured when no change occurs in the I/O state of the pins that are adjacent to the analog input channel during AD conversion processing.

Note 7-2: The conversion time refers to the interval from the time a conversion starting instruction is issued till the time the complete digital conversion value against the analog input value is loaded in the result register.

\*The conversion time is twice the normal value when one of the following conditions occurs:

- The first AD conversion executed in the 12-bit AD conversion mode after a system reset.
- The first AD conversion executed after the AD conversion mode is switched from 8-bit to 12-bit AD conversion mode.

### Power Pin Treatment Recommendations ( $V_{DD1}$ , $V_{SS1}$ )

Connect bypass capacitors that meet the following conditions between the  $V_{DD1}$  and  $V_{SS1}$  pins:

- Connect among the  $V_{DD1}$  and  $V_{SS1}$  pins and bypass capacitors C1 and C2 with the shortest possible heavy lead wires, making sure that the impedances between the both pins and the bypass capacitors are as equal as possible ( $L1=L1'$ ,  $L2=L2'$ ).
- Connect a large-capacity capacitor C1 and a small-capacity capacitor C2 in parallel.  
The capacitance of C2 should be approximately  $0.1\mu\text{F}$ .

Note:

The external peripheral circuit differs depending on the way in which the power-on reset and low-voltage detection reset functions are used. Refer to the Chapter, entitled "Reset Function," of the user's manual.

Figure 3 Sample Reset Circuit

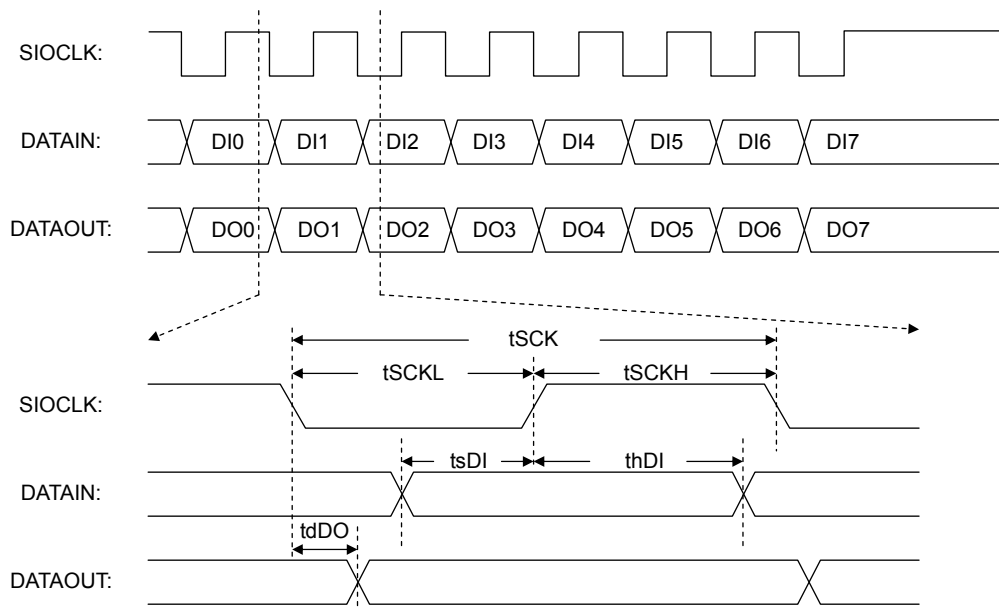

Figure 4 Serial I/O Waveforms

Figure 5 Pulse Input Timing Signal Waveform

Figure 6 Example of POR Only (LVD Deselected) Mode Waveforms (at Reset Pin with RRES Pull-up Resistor Only)

- The POR circuit generates a reset signal only when the power voltage is raised from the  $V_{SS}$  level.
- No stable reset signal is generated if power is turned on again when the power voltage does not go down to the  $V_{SS}$  level as shown in (a). If this case is anticipated, use the LVD function as explained below or configure an external reset circuit.
- A reset is effected only when power is turned on again after the power voltage goes down to and remains at the  $V_{SS}$  level for 100µs or longer as shown in (b).

Figure 7 Example of POR + LVD Mode Waveforms (at Reset Pin with RRES Pull-up Resistor Only)

- A reset is effected both when power is turned on and when it goes down.
- The hysteresis width (LVHYS) is introduced in the LVD circuit to prevent the iterations of the IC entering and exiting the reset state near the detection threshold level.
