

## DESCRIPTION

The MP6924A is a dual, fast turn-off, intelligent rectifier for synchronous rectification in LLC resonant converters.

The IC drives two N-channel MOSFETs, regulates their forward voltage drop to  $V_{fwd}$  (about 29mV), and turns the MOSFETs off before the switching current goes negative.

The MP6924A has a light-load function to latch off the gate driver under light-load conditions, limiting the current to  $175\mu$ A.

The MP6924A's fast turn-off enables both continuous conduction mode (CCM) and discontinuous conduction mode (DCM).

The MP6924A requires a minimal number of readily available, standard, external components and is available in a SOIC-8 package.

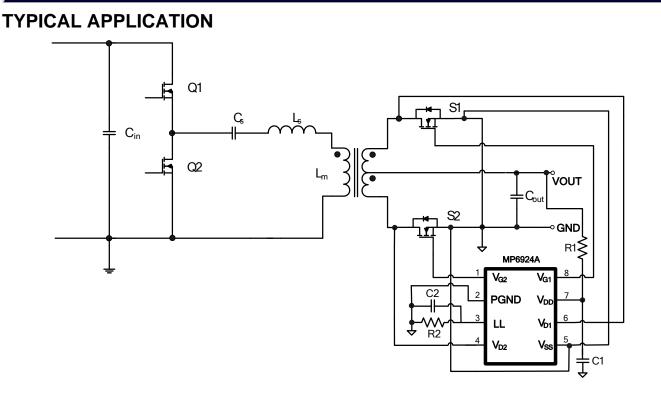

### FEATURES

- Works with Standard and Logic Level MOSFETs
- Compatible with Energy Star
- Fast Turn-Off Total Delay of 35ns
- Wide 4.2V ~ 35V V<sub>DD</sub> Operating Range
- 175µA Low Quiescent Current in Light-Load Mode
- Supports CCM, CrCM, and DCM Operation
- Supports High-Side and Low-Side Rectification
- Available in a SOIC-8 Package

### APPLICATIONS

- AC/DC Adapters
- PC Power Supplies
- LCD and LED TVs
- Isolated DC/DC Power Converters

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are registered trademarks of Monolithic Power Systems, Inc.

# PACKAGE REFERENCE

### ABSOLUTE MAXIMUM RATINGS (1)

$V_{DD}$ to $V_{SS}$	0.3V to +38V
PGND to V <sub>SS</sub>	0.3V to +0.3V
$V_G$ to $V_{SS}$	0.3V to +20V
$V_D$ to $V_{SS}$	1V to +180V
LL to V <sub>SS</sub>	0.3V to +6.5V
Continuous power dissipation (T	<sub>A</sub> = +25°C) <sup>(2)</sup>
SOIC-8	1.4W
Junction temperature	150°C
Lead temperature (solder)	260°C
Storage temperature	55°C to +150°C

### Recommended Operation Conditions <sup>(3)</sup>

V <sub>DD</sub> to V <sub>SS</sub>	4.2V to 35V
Operating junction temp. (T <sub>J</sub> )	-40°C to +125°C

#### 

NOTES:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub>(MAX), the junction-to-ambient thermal resistance θ<sub>JA</sub>, and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P<sub>D</sub>(MAX)=(T<sub>J</sub>(MAX)-T<sub>A</sub>)/θ<sub>JA</sub>. Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7, 4-layer PCB.

# **ELECTRICAL CHARACTERISTICS**

 $V_{DD}$  = 12V, -40°C  $\leq$  T<sub>J</sub>  $\leq$  +125°C, unless otherwise noted.

# TTPS MP

Pin # (SOIC-8)	Name	Description
1	$V_{G2}$	MOSFET 2 gate driver output.
2	PGND	Power ground. PGND is the power switch return.
3	LL	<b>Light-load timing setting.</b> Connect a resistor to LL to set the light-load timing. Leave LL open to prevent the IC from entering light-load mode. Pull LL low to disable the gate driver.
4	V <sub>D2</sub>	MOSFET 2 drain voltage sense.
5	Vss	Source pin used as reference for V <sub>D1</sub> and V <sub>D2</sub> .
6	$V_{D1}$	MOSFET 1 drain voltage sense.
7	$V_{\text{DD}}$	Supply voltage.
8	V <sub>G1</sub>	MOSFET 1 gate driver output.

# **PIN FUNCTIONS**

# **BLOCK DIAGRAM**

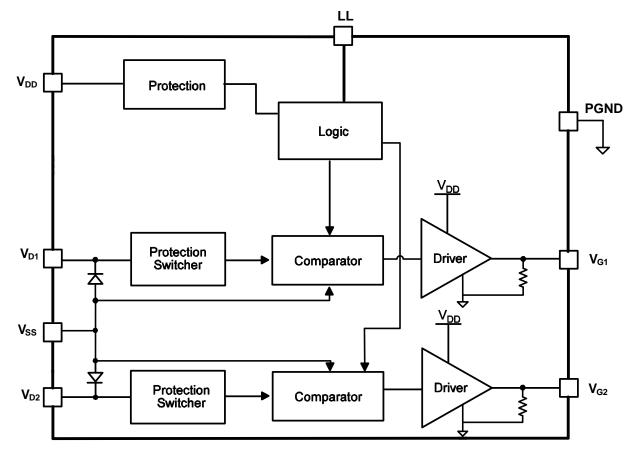

Figure 1: Functional Block Diagram

# **OPERATION**

MP6924A operates in The discontinuous mode (DCM), continuous conduction conduction mode (CCM), and critical conduction mode (CrCM). When the MP6924A operates in either DCM or CrCM, the control circuitry controls the gate in forward mode. The gate turns off when the MOSFET current is low. In CCM, the control circuitry turns off the gate during very fast transients.

### **VD Clamp**

Because  $V_{D1,2}$  can rise as high as 180V, a highvoltage JFET is used at the input. To prevent excessive currents when  $V_{DS1,2}$  drops below -0.7V, a 1k $\Omega$  resistor is recommended between  $V_{D1,2}$  and the drain of the external MOSFET.

### **Under-Voltage Lockout (UVLO)**

When  $V_{\text{DD}}$  is below the  $V_{\text{DD}}$  UVLO threshold, the MP6924A falls into sleep mode, and  $V_{\text{G1,2}}$  remains at a low level.

### Enable

If LL is pulled low, the MP6924A is in shutdown mode, which consumes  $175\mu$ A of shutdown current. If LL is pulled high during the rectification cycle, the gate driver does not appear until the next rectification cycle begins (see Figure 2).

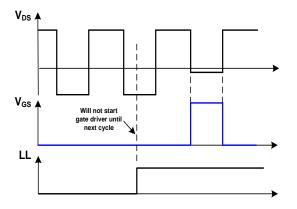

Figure 2: LL Control Scheme

### Thermal Shutdown

If the junction temperature of the chip exceeds the thermal shutdown threshold,  $V_{G1,2}$  is pulled low, and the MP6924A stops switching. The IC resumes normal function after the junction temperature drops 10°C.

### Turn-On Phase

When the switch current flows through the body diode of the MOSFET, there is a negative voltage drop ( $V_D - V_{SS}$ ) across the body diode.  $V_{DS}$  is much lower than the turn-on threshold of the control circuitry ( $V_{LL-DS}$ ), which triggers a charge current to turn on the MOSFET (see Figure 3).

### **Turn-On Blanking**

The control circuitry contains a blanking function that ensures that when the MOSFET turns on or off, it remains in that state for  $t_{B_ON}$  (~1.1µs), which determines the minimum on time. During the turn-on blanking period, the turn-off threshold is not blanked completely, but changes to about +100mV (instead of 0mV). This ensures that the part can always turn off, even during the turn-on blanking period, although it does so slower. Avoid setting the synchronous period below  $t_{B_ON}$  in CCM in the LLC converter to eliminate shoot-through.

### **Conduction Phase**

When  $V_{DS}$  rises above the forward voltage drop (- $V_{fwd}$ ) according to the decrease of the switching current, the MP6924A pulls down the gate voltage level to make the on resistance of the synchronous MOSFET larger to ease the rise of  $V_{DS}$ .

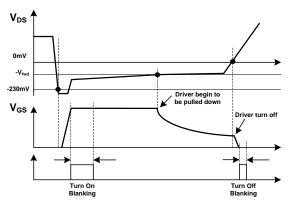

Figure 3: Turn-On/-Off Timing Diagram

The control scheme in Figure 3 shows  $V_{DS}$  adjusted to be around  $-V_{fwd}$ , even when the current through the MOSFET is fairly low. This function puts the driver voltage at a very low level when the synchronous MOSFET is turning off, which boosts the turn-off speed.

#### **Turn-Off Phase**

When V<sub>DS</sub> rises to trigger the turn-off threshold, the gate voltage is pulled to zero after a very short turn-off delay (see Figure 3).

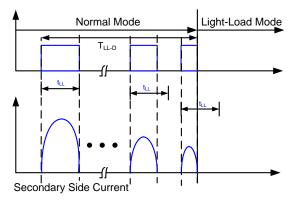

#### **Turn-Off Blanking**

After the gate driver is pulled to zero by  $V_{DS}$ reaching the turn-off threshold, turn-off blanking is triggered to ensure that the gate driver is off for at least tB ON to prevent an erroneous trigger on VDS.

#### Light-Load Latch-Off Function

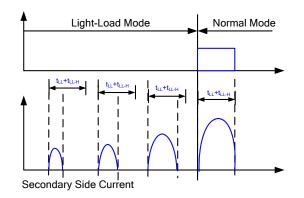

The gate driver of the MP6924A is latched off to save driver loss in light-load condition and improve efficiency.

When the MOSFET's switching cvcle conducting period falls below T<sub>LL</sub>, the MP6924A enters light-load mode and latches off the MOSFET after a light-load enter delay  $(T_{LL-D})$ (see Figure 4).

#### Figure 4: MP6924A Entering Light-Load Mode

During light-load mode, the MP6924A monitors the body diode conduction time. If this time exceeds  $T_{II} + T_{II-H}$ , the IC exits light-load mode and initiates the gate driver in the next new switching cycle (see Figure 5 and Figure 6).

#### Figure 5: MP6924A Exiting Light-Load Mode

Light-load enter timing  $(T_{LL})$  is programmable by connecting a resistor (R<sub>LL</sub>) to LL. By monitoring the LL current (the LL voltage is kept at ~2V internally),  $T_{LL}$  can be calculated with Equation (1):

$$T_{LL} = R_{LL}(k\Omega) \cdot \frac{2.3us}{100k\Omega}$$
(1)

If the light-load mode of the MP6924A ends during the rectification cycle, the gate driver signal does not appear until the next rectification cycle begins (see Figure 6).

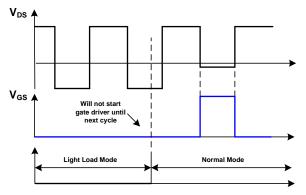

Figure 6: Gate Driver Starting after Exiting Light-Load Mode

### **APPLICATION INFORMATION**

### **Layout Considerations**

Listed below are the main recommendations that should be taken into consideration when designing the PCB.

#### Sensing for $V_D/V_S$

- 1. Keep the sensing connections  $(V_{D1}/V_{SS}, V_{D2}/V_{SS})$  as close to each of the MOSFETs (drain/source) as possible.
- 2. Keep the two channels' sensing loops separated from each other.
- 3. Make the sensing loop as small as possible (see Figure 7).

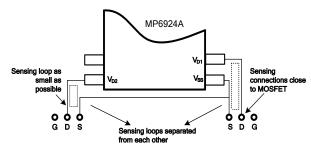

Figure 7: Sensing for V<sub>D</sub>/V<sub>S</sub>

Figure 8 shows a layout example of the MP6924A driving PowerPAK SO8 package MOSFETs with two, separate, small sensing loops.

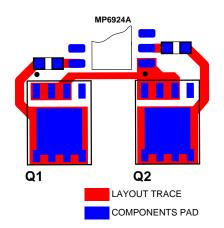

Figure 8: Layout Example for Sensing Loop and V<sub>DD</sub> Decoupling

#### **V**<sub>DD</sub> Decoupling Capacitor

 Place a decoupling capacitor no smaller than 1µF from V<sub>DD</sub> to PGND close to the IC for adequate filtering (see Figure 9).

#### System Power Loop

- Keep the two channels' power loops separated from each other (see Figure 9).
  This minimizes the interaction between the two channels' power loops, which may affect the voltage sensing of the IC.
- 2. Make the power loop as small as possible to reduce parasitic inductance.

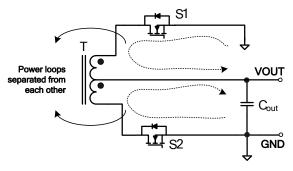

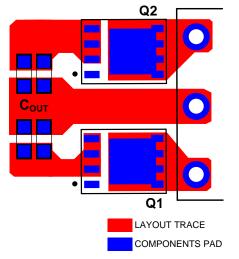

Figure 9: System Power Loop

Figure 10 shows a layout example of the power loop trace, which has a minimized loop length. The two channel power traces do not cross each other.

It is highly recommended to place the driver's sensing loop trace away from the power loop trace (see Figure 10). The sensing loop trace and power loop trace can be placed on different layers to keep them separate from each other.

Do not place the driver IC inside the power loop. This may affect MOSFET voltage sensing.

#### SR MOSFET Selection and Driver Ability

Power MOSFET selection is a trade-off between the R<sub>DS(ON)</sub> and Q<sub>g</sub>. To achieve high efficiency, a MOSFET with a smaller R<sub>DS(ON)</sub> is recommended. A larger Q<sub>q</sub> with a smaller R<sub>DS(ON)</sub> makes the turn-on/-off speed lower and the power loss larger. For the MP6924A, V<sub>DS</sub> is adjusted at V<sub>fwd</sub> during the driving period. A MOSFET with a small R<sub>DS(ON)</sub> is not recommended because the gate driver may be kept at a fairly low level with a small R<sub>DS(ON)</sub>, even when the system load is high, which makes the advantage of the low R<sub>DS(ON)</sub> inconspicuous.

Figure 11 shows the typical waveform of the LLC on the secondary side. To achieve a fairly high usage of the MOSFET's  $R_{DS(ON)}$ , it is expected that the MOSFET driver voltage is kept at the maximum level until the last 25% of the SR conduction period. Calculate  $V_{DS}$  with Equation (2):

$$V_{\text{DS}} = -R_{\text{ds(ON)}} \cdot \frac{\sqrt{2}}{2} \cdot I_{\text{peak}} = -R_{\text{ds(ON)}} \cdot I_{\text{OUT}} = -V_{\text{fwd}} \quad (2)$$

Where  $V_{DS}$  is drain-source voltage of the MOSFET.

The MOSFET's  $R_{DS(ON)}$  is recommended to be no lower than  $\sim V_{fwd}/I_{OUT}$  (m $\Omega$ ). For example, in a 10A application with  $V_{fwd}$  at 29mV, the  $R_{DS(ON)}$  of the MOSFET is recommended to be no lower than 2.9m $\Omega$ .

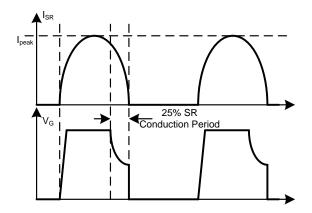

Figure 11: Synchronous Rectification Typical Waveform in LLC

 $Q_g$  of the MOSFET affects the turn-on and turnoff delay. Figure 12 shows the turn-on delay (t<sub>Don</sub>) and the turn-off delay (t<sub>Doff</sub>). t<sub>Don</sub> indicates how long the body diode conducts before the MOSFET turns on, while t<sub>Doff</sub> indicates how long the driver takes to turn off the MOSFET. With a higher turn-on delay, the body diode conduction duration of the MOSFET is longer, which brings down the total efficiency. However, with a higher turn-off delay, the shoot-through risk is higher in CCM operation.

Figure 12 and Figure 13 show the  $t_{\text{Don}}$  and  $t_{\text{Doff}}$  of the MP6924A according to different  $C_{\text{load}}$  values.

### Turn-On Delay vs. CLOAD

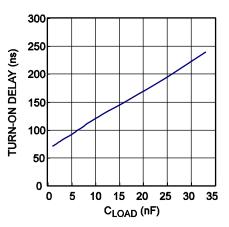

Figure 12: Turn-On Delay vs. Cload

Turn-Off Delay vs. CLOAD

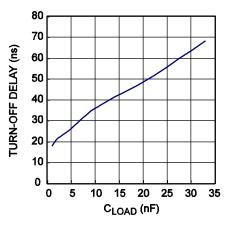

Figure 13: Turn-Off Delay vs. Cload

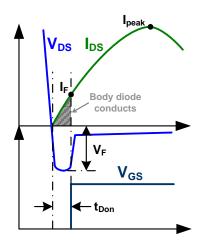

Figure 14: Turn-On Delay Effect on Efficiency

Figure 14 shows how t<sub>Don</sub> affects system efficiency. During t<sub>Don</sub>, the body diode of the SR MOSFET conducts, which leads to a power loss that can be calculated with Equation (3):

$$P_{on} \approx \frac{V_{F} \cdot I_{F}}{2} \cdot 2f_{s} \cdot t_{Don} = V_{F} \cdot I_{F} \cdot f_{s} \cdot t_{Don} \quad (3)$$

Where  $V_F$  is the body diode forward voltage drop, I<sub>F</sub> is the switching current when the turnon delay (t<sub>Don</sub>) has ended, and f<sub>s</sub> is the switching frequency.

When considering the switching current as a complete sine wave, I<sub>F</sub> can be estimated with Equation (4) and Equation (5):

$$\mathbf{I}_{\mathsf{F}} = \mathbf{I}_{\mathsf{peak}} \cdot \sin(2 \cdot \mathbf{f}_{\mathsf{s}} \cdot \mathbf{t}_{\mathsf{Don}} \cdot \pi) \tag{4}$$

$$I_{\text{peak}} \approx \frac{\pi}{2} \cdot I_{\text{out}}$$
 (5)

Where I<sub>peak</sub> is the peak switching current through the MOSFET, and I<sub>out</sub> is the system output current.

When plugging the values from Equation (4) and Equation (5) into Equation (3), the turn-on delay power loss through the SR MOSFET's body diode can be derived with Equation (6):

$$\mathsf{P}_{\mathsf{on}} = \frac{\pi}{2} \cdot \mathsf{I}_{\mathsf{out}} \cdot \mathsf{V}_{\mathsf{F}} \cdot \mathsf{f}_{\mathsf{s}} \cdot \mathsf{t}_{\mathsf{Don}} \cdot \mathsf{sin}(2 \cdot \mathsf{f}_{\mathsf{s}} \cdot \mathsf{t}_{\mathsf{Don}} \cdot \pi)$$
(6)

Figure 15 shows how different turn-on delay values affect efficiency according to different output voltages. To keep the body diode conduction loss at a fairly low level (below 0.5% of the output power), the turn-on delay is recommended to be less than 5% of the switching cycle. For example, in a  $f_{sw} = 200$ kHz LLC system, the switching cycle is ~5µs. It is recommended to select a MOSFET that makes  $t_{Don} < 250$ ns.

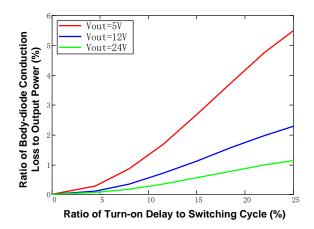

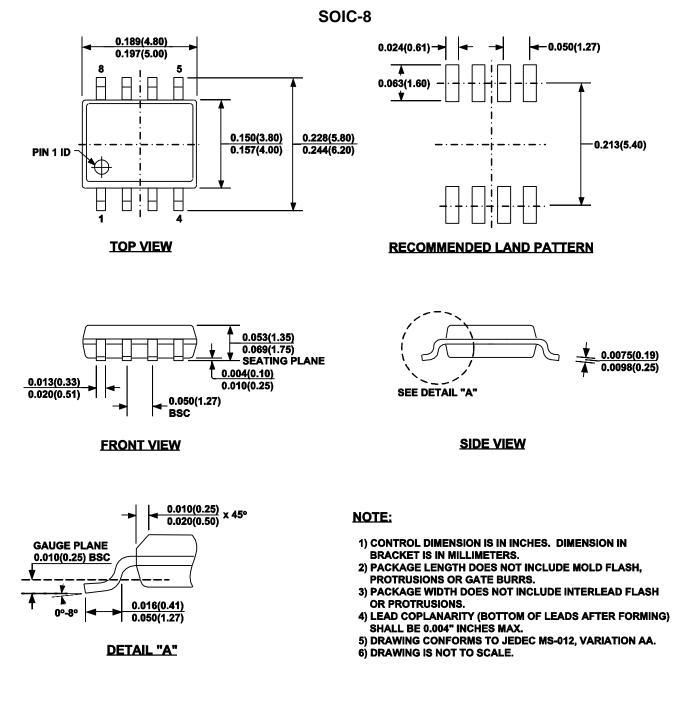

Figure 15: Turn-On Delay vs. Power Loss

The turn-off delay (t<sub>Doff</sub>) is critical in some fast transient CCM applications. Choose the MOSFET to make t<sub>Doff</sub> below the CCM current transient duration. Otherwise, the MOSFET may need to be selected with a lower Q<sub>a</sub>, or an external totem pole driver circuit may be added to prevent shoot-through.
