15.8.177 reg_ifmt_ift_sec_IF_start_column_type (ifmt_ift_sec_IF_start_column)—Offset 30408h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_sec_IF_start_column: [ISPMMADR] + 30408h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

unused_IF_start_column	IF_start_column

Bit Range	Default & Access	Description
31:16	0h RW	**unused_IF_start_column:** Unused
15:0	0h RW	**IF_start_column:** Start column: number pixel component to skip before passing the 1st of a line

15.8.178 reg_ifmt_ift_sec_IF_Cropped_height_type (ifmt_ift_sec_IF_Cropped_height)—Offset 3040Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ifmt_ift_sec_IF_Cropped_height: [ISPMMADR] + 3040Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

unused_IF_Cropped_height	IF_Cropped_height

Bit Range	Default & Access	Description
31:16	0h RW	**unused_IF_Cropped_height:** Unused
15:0	0h RW	**IF_Cropped_height:** Cropped height: number of lines of the cropped image

15.8.179 reg_ifmt_ift_sec_IF_Cropped_width_type (ifmt_ift_sec_IF_Cropped_width)—Offset 30410h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ifmt_ift_sec_IF_Cropped_width: [ISPMMADR] + 30410h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Bits 31:16: unused_IF_Cropped_width; Bits 15:0: IF_Cropped_width

Bit Range	Default & Access	Description
31:16	0h RW	**unused_IF_Cropped_width:** Unused
15:0	0h RW	**IF_Cropped_width:** Cropped width: number of pixel component of the cropped image

15.8.180 reg_ifmt_ift_sec_IF_Vert_Decim_type (ifmt_ift_sec_IF_Vert_Decim)—Offset 30414h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ifmt_ift_sec_IF_Vert_Decim: [ISPMMADR] + 30414h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Bits 31:12: unused_IF_Vert_Decim; Bits 11:0: IF_Vert_Decim

Bit Range	Default & Access	Description
31:12	0h RW	**unused_IF_Vert_Decim:** Unused
11:0	0h RW	**IF_Vert_Decim:** Vertical decimation factor

15.8.181 reg_ifmt_ift_sec_IF_Horiz_Decim_type (ifmt_ift_sec_IF_Horiz_Decim)—Offset 30418h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_sec_IF_Horiz_Decim: [ISPMMADR] + 30418h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

unused_IF_Start_addr	IF_Start_addr

Bit Range	Default & Access	Description
31:24	0h RW	**unused_IF_Start_addr:** Unused
23:0	0h RW	**IF_Start_addr:** Start address in bytes: memory buffer start address

15.8.186 reg_ifmt_ift_sec_IF_End_addr_type (ifmt_ift_sec_IF_End_addr)—Offset 3042Ch

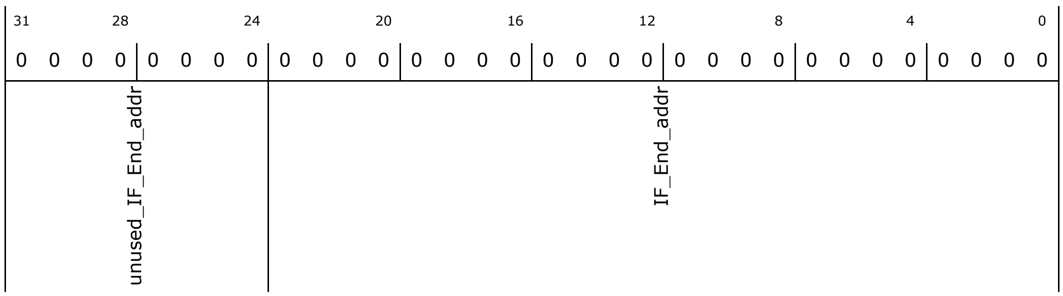
Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ifmt_ift_sec_IF_End_addr: [ISPMMADR] + 3042Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**unused_IF_End_addr:** Unused
23:0	0h RW	**IF_End_addr:** End address in bytes: memory buffer end address

15.8.187 reg_ifmt_ift_sec_IF_incr_type (ifmt_ift_sec_IF_incr)—Offset 30430h

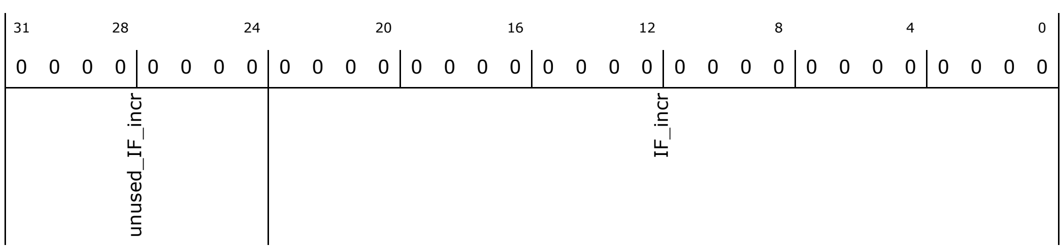
Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ifmt_ift_sec_IF_incr: [ISPMMADR] + 30430h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:24	0h RW	**unused_IF_incr:** Unused

Bit Range	Default & Access	Description
23:0	0h RW	**IF_incr:** Word increment in memory word: word increment value after writting each word

15.8.188 reg_ifmt_ift_sec_IF_YUV_420_format_type (ifmt_ift_sec_IF_YUV_420_format)—Offset 30434h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_sec_IF_YUV_420_format: [ISPMMADR] + 30434h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0

unused_IFMT_IRQ_ctrl_clear | IFMT_IRQ_ctrl_clear

Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_clear:** Unused
4:0	0h WO	**IFMT_IRQ_ctrl_clear:** Clears (set to '0') bits in IFMT_IRQ_ctrl_status. When writing a '1' into a bit of this register, the corresponding bit in the IFMT_IRQ_ctrl_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the IFMT_IRQ_ctrl_status is not affected.

15.8.243 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_enable_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_enable)—Offset 30A10h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_enable: [ISPMMADR] + 30A10h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

unused_IFMT_IRQ_ctrl_enable | IFMT_IRQ_ctrl_enable

Bit Range	Default & Access	Description
31:5	0h RW	**unused_IFMT_IRQ_ctrl_enable:** Unused
4:0	0h RW	**IFMT_IRQ_ctrl_enable:** Indicates for each bit whether an interrupt cause as monitored by the IFMT_IRQ_ctrl_status register also affects the IRQ pin (value='1') or not (value='0')

15.8.244 reg_ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_pulse_type (ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_pulse)—Offset 30A14h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_irq_ctrl_IFMT_IRQ_ctrl_edge_pulse: [ISPMMADR] + 30A14h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

gdc1_oydim: [ISPMMADR] + 50018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_oydim (31:12), oydim (11:0)

Bit Range	Default & Access	Description
31:12	0h RW	**unused_oydim:** Unused
11:0	0h RW	**oydim:** Output Y dimension of the produced block of pixels

15.8.584 reg_gdc1_src_addr_type (gdc1_src_addr)—Offset 5001Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_src_addr: [ISPMMADR] + 5001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_src_addr (31:25), src_addr (24:0)

Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_addr:** Unused
24:0	0h RW	**src_addr:** Source (input) pixel base address [byte-based]

15.8.585 reg_gdc1_src_end_type (gdc1_src_end)—Offset 50020h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_src_end: [ISPMMADR] + 50020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_src_end							src_end																								

Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_end:** Unused
24:0	0h RW	**src_end:** End address. When reached wrap around. [byte-based]

15.8.586 reg_gdc1_src_wrap_type (gdc1_src_wrap)—Offset 50024h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_src_wrap: [ISPMMADR] + 50024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_src_wrap							src_wrap																								

Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_wrap:** Unused
24:0	0h RW	**src_wrap:** Wrap addr. Wrap here when src_end reached [byte-based]

15.8.587 reg_gdc1_src_stride_type (gdc1_src_stride)—Offset 50028h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_src_stride: [ISPMMADR] + 50028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_src_stride | src_stride

Bit Range	Default & Access	Description
31:19	0h RW	**unused_src_stride:** Unused
18:0	0h RW	**src_stride:** Source (input) pixel stride [byte-based]

15.8.588 reg_gdc1_dst_addr_type (gdc1_dst_addr)—Offset 5002Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_dst_addr: [ISPMMADR] + 5002Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_dst_addr | dst_addr

Bit Range	Default & Access	Description
31:25	0h RW	**unused_dst_addr:** Unused
24:0	0h RW	**dst_addr:** Destination (output) pixel base address [byte-based]

15.8.589 reg_gdc1_dst_stride_type (gdc1_dst_stride)—Offset 50030h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_dst_stride: [ISPMMADR] + 50030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

unused_dst_stride | dst_stride

Bit Range	Default & Access	Description
31:19	0h RW	**unused_dst_stride:** Unused
18:0	0h RW	**dst_stride:** Destination (output) pixel stride [byte-based]

15.8.590 reg_gdc1_dx_type (gdc1_dx)—Offset 50034h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_dx: [ISPMMADR] + 50034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

unused_dx | dx

Bit Range	Default & Access	Description
31:14	0h RW	**unused_dx:** Unused
13:0	0h RW	**dx:** Scaling only: Horizontal scaling factor

15.8.591 reg_gdc1_dy_type (gdc1_dy)—Offset 50038h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_dy: [ISPMMADR] + 50038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4			0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_dy																		dy													

Bit Range	Default & Access	Description
31:14	0h RW	**unused_dy:** Unused
13:0	0h RW	**dy:** Scaling only: Vertical scaling factor

15.8.592 reg_gdc1_P0_primX_ixdim_type (gdc1_P0_primX_ixdim)—Offset 5003Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_P0_primX_ixdim: [ISPMMADR] + 5003Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4			0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_P0_primX_ixdim									P0_primX_ixdim																						

Bit Range	Default & Access	Description
31:23	0h RW	**unused_P0_primX_ixdim:** Unused
22:0	0h RW	**P0_primX_ixdim:** P0(X) Tetragon mode: top-left coordinate (X), Scaling mode: dimension of the input region (X), fixed point notation, 13.10

15.8.593 reg_gdc1_P0_primY_iydim_type (gdc1_P0_primY_iydim)—Offset 50040h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_P0_primY_iydim: [ISPMMADR] + 50040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_interp_type (bits 31:2), interp_type (bits 1:0)

Bit Range	Default & Access	Description
31:2	0h RW	**unused_interp_type:** Unused
1:0	0h RW	**interp_type:** Type of interpolation: 00=NND ; 01=BLI ; 10=BCI ; 11=LUT

15.8.602 reg_gdc1_scan_mode_type (gdc1_scan_mode)—Offset 50064h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc1_scan_mode: [ISPMMADR] + 50064h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_scan_mode (bits 31:1), scan_mode (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_scan_mode:** Unused
0	0h RW	**scan_mode:** Scanning mode: 0 = STB (Slide To Bottom) ; 1 = STR (Slide To Right)

15.8.603 reg_gdc1_proc_mode_type (gdc1_proc_mode)—Offset 50068h

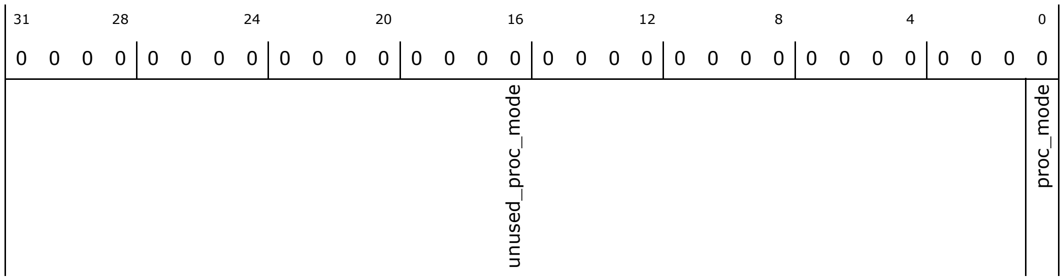
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc1_proc_mode: [ISPMMADR] + 50068h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:1	0h RW	**unused_proc_mode:** Unused
0	0h RW	**proc_mode:** Processing mode: 0 = Rectangular-based scaling ; 1 = Tetragon-based scaling

15.8.604 reg_gdc2_reg0_type (gdc2_reg0)—Offset 60000h

Status register: Current opx, opy, top-level FSM state

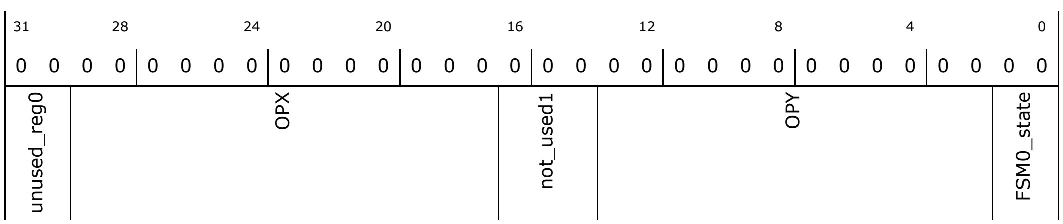
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_reg0: [ISPMMADR] + 60000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RW	**unused_reg0:** Unused
29:17	0h RO	**OPX:** OPX value

Bit Range	Default & Access	Description
16:14	0h RO	**not_used1:** N/A
13:2	0h RO	**OPY:** OPY value
1:0	0h RO	**FSM0_state:** FSM0 state: 00=Idle ; 01=Busy-receiving data needed to kick the device ; 10=Busy-wait state ; 11=Busy-run state

15.8.605 reg_gdc2_woi_x_type (gdc2_woi_x)—Offset 60004h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_woi_x: [ISPMMADR] + 60004h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_bpp																												bpp			

Bit Range	Default & Access	Description
31:4	0h RW	**unused_bpp:** Unused
3:0	0h RW	**bpp:** Bits per input/output pixel, allowed: 8, 10, 12, 14

15.8.608 reg_gdc2_fryipxfrx_start_type (gdc2_fryipxfrx_start)—Offset 60010h

Fractional component of the starting X and Y position for scaling given in fixed point notation

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_fryipxfrx_start: [ISPMMADR] + 60010h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_fryipxfrx_start	fry	ipxfrx

Bit Range	Default & Access	Description
31:26	0h RW	**unused_fryipxfrx_start:** Unused
25:16	0h RW	**fry:** Fractional component of the Y start
15:0	0h RW	**ipxfrx:** Integer (6) and Fractional (10) component of the X start

15.8.609 reg_gdc2_oxdim_type (gdc2_oxdim)—Offset 60014h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_oxdim: [ISPMMADR] + 60014h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_oxdim	oxdim

Bit Range	Default & Access	Description
31:13	0h RW	**unused_oxdim:** Unused
12:0	0h RW	**oxdim:** Output X dimension of the produced block of pixels

15.8.610 reg_gdc2_oydim_type (gdc2_oydim)—Offset 60018h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_oydim: [ISPMMADR] + 60018h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_oydim (31:12), oydim (11:0)

Bit Range	Default & Access	Description
31:12	0h RW	**unused_oydim:** Unused
11:0	0h RW	**oydim:** Output Y dimension of the produced block of pixels

15.8.611 reg_gdc2_src_addr_type (gdc2_src_addr)—Offset 6001Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_src_addr: [ISPMMADR] + 6001Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_src_addr (31:25), src_addr (24:0)

Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_addr:** Unused
24:0	0h RW	**src_addr:** Source (input) pixel base address [byte-based]

15.8.612 reg_gdc2_src_end_type (gdc2_src_end)—Offset 60020h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_src_end: [ISPMMADR] + 60020h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_src_end							src_end																								

Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_end:** Unused
24:0	0h RW	**src_end:** End address. When reached wrap around. [byte-based]

15.8.613 reg_gdc2_src_wrap_type (gdc2_src_wrap)—Offset 60024h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_src_wrap: [ISPMMADR] + 60024h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_src_wrap							src_wrap																								

Bit Range	Default & Access	Description
31:25	0h RW	**unused_src_wrap:** Unused
24:0	0h RW	**src_wrap:** Wrap addr. Wrap here when src_end reached [byte-based]

15.8.614 reg_gdc2_src_stride_type (gdc2_src_stride)—Offset 60028h

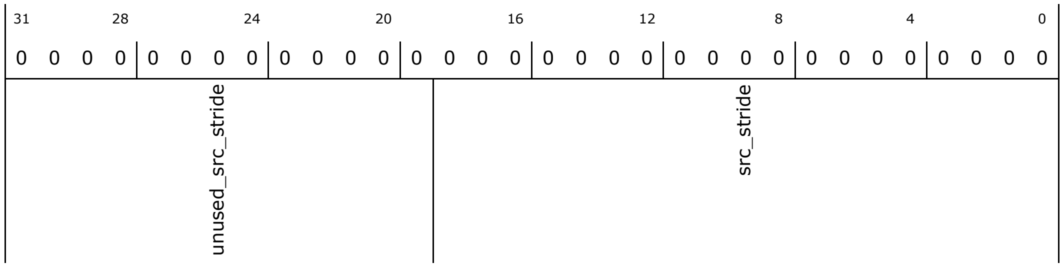
Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_src_stride: [ISPMMADR] + 60028h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:19	0h RW	**unused_src_stride:** Unused
18:0	0h RW	**src_stride:** Source (input) pixel stride [byte-based]

15.8.615 reg_gdc2_dst_addr_type (gdc2_dst_addr)—Offset 6002Ch

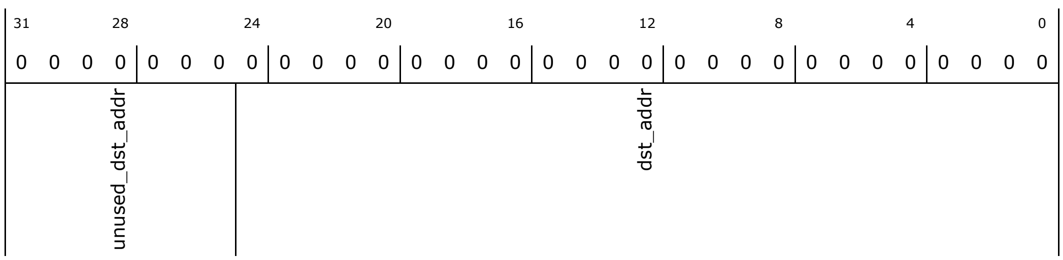
Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_dst_addr: [ISPMMADR] + 6002Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:25	0h RW	**unused_dst_addr:** Unused
24:0	0h RW	**dst_addr:** Destination (output) pixel base address [byte-based]

15.8.616 reg_gdc2_dst_stride_type (gdc2_dst_stride)—Offset 60030h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_dst_stride: [ISPMMADR] + 60030h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_dst_stride | dst_stride

Bit Range	Default & Access	Description
31:19	0h RW	**unused_dst_stride:** Unused
18:0	0h RW	**dst_stride:** Destination (output) pixel stride [byte-based]

15.8.617 reg_gdc2_dx_type (gdc2_dx)—Offset 60034h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_dx: [ISPMMADR] + 60034h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_dx | dx

Bit Range	Default & Access	Description
31:14	0h RW	**unused_dx:** Unused
13:0	0h RW	**dx:** Scaling only: Horizontal scaling factor

15.8.618 reg_gdc2_dy_type (gdc2_dy)—Offset 60038h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_dy: [ISPMMADR] + 60038h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_dy | dy

Bit Range	Default & Access	Description
31:14	0h RW	**unused_dy:** Unused
13:0	0h RW	**dy:** Scaling only: Vertical scaling factor

15.8.619 reg_gdc2_P0_primX_ixdim_type (gdc2_P0_primX_ixdim)—Offset 6003Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P0_primX_ixdim: [ISPMMADR] + 6003Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_P0_primX_ixdim | P0_primX_ixdim

Bit Range	Default & Access	Description
31:23	0h RW	**unused_P0_primX_ixdim:** Unused
22:0	0h RW	**P0_primX_ixdim:** P0(X) Tetragon mode: top-left coordinate (X), Scaling mode: dimension of the input region (X), fixed point notation, 13.10

15.8.620 reg_gdc2_P0_primY_iydim_type (gdc2_P0_primY_iydim)—Offset 60040h

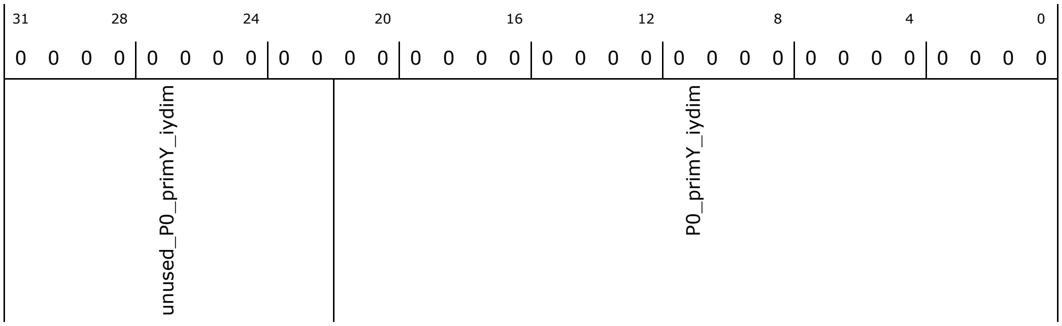
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P0_primY_iydim: [ISPMMADR] + 60040h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:22	0h RW	**unused_P0_primY_iydim:** Unused
21:0	0h RW	**P0_primY_iydim:** P0(Y) Tetragon mode: top-left coordinate (Y), Scaling mode: dimension of the input region (Y), fixed point notation, 12.10

15.8.621 reg_gdc2_P1_primX_type (gdc2_P1_primX)—Offset 60044h

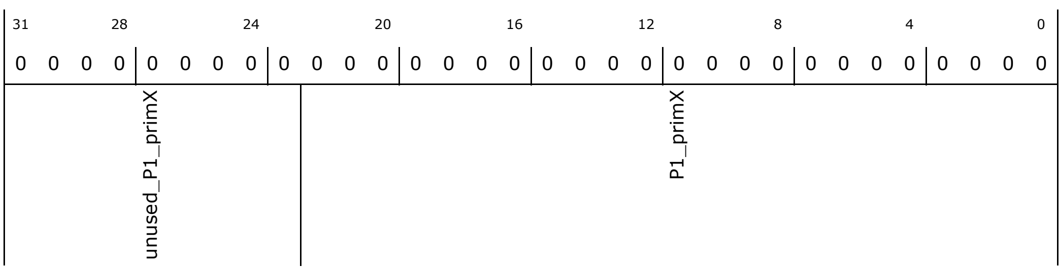
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gdc2_P1_primX: [ISPMMADR] + 60044h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:23	0h RW	**unused_P1_primX:** Unused
22:0	0h RW	**P1_primX:** P1(X) Tetragon mode only: top-right coordinate (X), fixed point notation, 13.10

15.8.622 reg_gdc2_P1_primY_type (gdc2_P1_primY)—Offset 60048h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gdc2_P1_primY: [ISPMMADR] + 60048h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0

Bit Range	Default & Access	Description
31:24	0h RW	**unused_MMU_page_table_base:** Unused
23:0	0h RW	**MMU_page_table_base:** Defines the physical page number of the page tables

15.8.633 reg_inp_sys_csi_receiver_csi1_dev_ready_type (inp_sys_csi_receiver_csi1_dev_ready)—Offset 80100h

Set after programming operational registers to enable receiver

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

inp_sys_csi_receiver_csi1_dev_ready: [ISPMMADR] + 80100h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_csi1_dev_ready | mask_data_id_err | mask_ecc_double_bit_err | mask_rx_data_timeout_err | mask_sot_sync_err | mask_overrun_err | mask_init_time_out_err | reserved_1 | device_ready

Bit Range	Default & Access	Description
31:8	0h RW	**unused_csi1_dev_ready:** Unused
7	0h RW	**mask_data_id_err:** Set to mask error recovery when data ID error is detected
6	0h RW	**mask_ecc_double_bit_err:** Set to mask error recovery when ECC double bit error is detected
5	0h RW	**mask_rx_data_timeout_err:** Set to mask error recovery when receive data time out error is detected
4	0h RW	**mask_sot_sync_err:** Set to mask error recovery when start of transmission sync error is detected
3	0h RW	**mask_overrun_err:** set to mask overrun: NOT used now, can be discarded
2	0h RW	**mask_init_time_out_err:** Set to mask error recovery when initialization time out error is detected
1	0h RO	**reserved_1:** Reserved
0	0h RW	**device_ready:** Set to indicate that device is ready for reception

15.8.634 reg_inp_sys_csi_receiver_csi1_int_status_type (inp_sys_csi_receiver_csi1_int_status)—Offset 80104h

Interrupt Status

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_int_status: [ISPMMADR] + 80104h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
							unused_csi1_int_status								err_line_sync	err_escape	err_data_timeout	err_frame_data	err_frame_sync	err_id	err_crc	no_ecc_err	err_ecc_corr	err_ecc_double	err_control	err_sot_sync_hs	err_sot_hs	sleep_mode_exit	sleep_mode_entry	err_init_timeout	reserved_0

Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi1_int_status:** Unused
16	0h RW/1C	**err_line_sync:** Set if line number for line start and line end packets do not match
15	0h RW/1C	**err_escape:** Set if an unrecognised escape entry command is received
14	0h RW/1C	**err_data_timeout:** Set if time taken to receive a packet exceeds programmed timeout value
13	0h RW/1C	**err_frame_data:** Set if data packets within a frame has errors
12	0h RW/1C	**err_frame_sync:** Set if frame start is not paired with frame end for same virtual channel
11	0h RW/1C	**err_id:** Set if packet header has a unrecognised data id
10	0h RW/1C	**err_crc:** Set if computed CRC differs from received value
9	0h RW/1C	**no_ecc_err:** Set if no ECC error detected in packet
8	0h RW/1C	**err_ecc_corr:** Set if ECC error detected and corrected for one bit
7	0h RW/1C	**err_ecc_double:** Set if ECC error detected for two or more bits
6	0h RW/1C	**err_control:** Set if DPHY flags a control error
5	0h RW/1C	**err_sot_sync_hs:** Set if DPHY flags start of transmission synchronisation error
4	0h RW/1C	**err_sot_hs:** Set if DPHY flags start of transmission error
3	0h RW/1C	**sleep_mode_exit:** Set if DPHY exits ultra low power state
2	0h RW/1C	**sleep_mode_entry:** Set if DPHY enters ultra low power state
1	0h RW/1C	**err_init_timeout:** Set if Initialization timeout error occurs on DPHY data lanes
0	0h RO	**reserved_0:** Always set to 0

15.8.635 reg_inp_sys_csi_receiver_csi1_int_enable_type (inp_sys_csi_receiver_csi1_int_enable)—Offset 80108h

Interrupt Enable

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_int_enable: [ISPMMADR] + 80108h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_csi1_int_enable															err_line_sync	err_escape	err_data_timeout	err_frame_data	err_frame_sync	err_id	err_crc	no_ecc_err	err_ecc_corr	err_ecc_double	err_control	err_sot_sync_hs	err_sot_hs	sleep_mode_exit	sleep_mode_entry	err_init_timeout	overrun

Bit Range	Default & Access	Description
31:17	0h RW	**unused_csi1_int_enable:** Unused
16	0h RW	**err_line_sync:** Enable line sync error interrupt
15	0h RW	**err_escape:** Enable escape entry error interrupt
14	0h RW	**err_data_timeout:** Enable timeout error interrupt
13	0h RW	**err_frame_data:** Enable frame data error interrupt
12	0h RW	**err_frame_sync:** Enable frame sync error interrupt
11	0h RW	**err_id:** Enable data id error interrupt
10	0h RW	**err_crc:** Enable CRC error interrupt
9	0h RW	**no_ecc_err:** Enable no ECC error interrupt
8	0h RW	**err_ecc_corr:** Enable ECC error detected and corrected for one bit interrupt
7	0h RW	**err_ecc_double:** Enable ECC error detected for two or more bits interrupt
6	0h RW	**err_control:** Enable control error interrupt

Bit Range	Default & Access	Description
5	0h RW	**err_sot_sync_hs:** Enable start of transmission synchronisation error interrupt
4	0h RW	**err_sot_hs:** Enable start of transmission error interrupt
3	0h RW	**sleep_mode_exit:** Enable sleep mode exit interrupt
2	0h RW	**sleep_mode_entry:** Enable sleep mode entry interrupt
1	0h RW	**err_init_timeout:** Enable Initialization timeout error interrupt
0	0h RW	**overrun:** Enable FIFO overrun interrupt: NOT available now, can be discarded

15.8.636 reg_inp_sys_csi_receiver_csi1_func_prg_type (inp_sys_csi_receiver_csi1_func_prg)—Offset 8010Ch

Functional Programming

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_func_prg: [ISPMMADR] + 8010Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 0007FFFFh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
unused_csi1_func_prg													func_prg_reg_2			func_prg_reg_1								func_prg_reg_0							

Bit Range	Default & Access	Description
31:19	0h RW	**unused_csi1_func_prg:** Unused
18:16	7h RW	**func_prg_reg_2:** Byte 2 for functional programming
15:8	FFh RW	**func_prg_reg_1:** Byte 1 for functional programming
7:0	FFh RW	**func_prg_reg_0:** Byte 0 for functional programming

15.8.637 reg_inp_sys_csi_receiver_csi1_init_cnt_type (inp_sys_csi_receiver_csi1_init_cnt)—Offset 80110h

Duration after power up when DPHY lanes will not be observed

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi1_init_cnt: [ISPMMADR] + 80110h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_csi1_init_cnt (31:16), init_timer_reg_1 (15:8), init_timer_reg_0 (7:0)

Bit Range	Default & Access	Description
31:16	0h RW	**unused_csi1_init_cnt:** Unused
15:8	0h RW	**init_timer_reg_1:** Byte 1 for power up timer
7:0	0h RW	**init_timer_reg_0:** Byte 0 for power up timer

15.8.638 reg_inp_sys_csi_receiver_csi_backend_fs_ls_type (inp_sys_csi_receiver_csi_backend_fs_ls)—Offset 8011Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_csi_receiver_csi_backend_fs_ls: [ISPMMADR] + 8011Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000002h

31			28				24				20				16				12				8				4				0

unused_str_deint_portB_cnt

str_deint_portB_cnt

Bit Range	Default & Access	Description
31:16	0h RW	**unused_str_deint_portB_cnt:** Unused
15:0	0h RW	**str_deint_portB_cnt:** stream data count for portB of stream deinterleave block

15.8.837 reg_inp_sys_fifo_adapter_CSI_generic_short_packet_available_type

(inp_sys_fifo_adapter_CSI_generic_short_packet_available)—Offset 8B008h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_fifo_adapter_CSI_generic_short_packet_available : [ISPMMADR] + 8B008h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Fields: unused_CSI_generic_short_packet_available (bits 31:1), CSI_generic_short_packet_available (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_CSI_generic_short_packet_available:** Unused
0	1h RO	**CSI_generic_short_packet_available:** Returns 1 if there is a generic short packet available. Returns 0 is there is no generic short packet available.

15.8.838 reg_inp_sys_irq_ctrl_irq_edge_type (inp_sys_irq_ctrl_irq_edge)—Offset 8C000h

IRQ active edge select per interrupt input. Rising edge: 1, Falling edge: 0

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

inp_sys_irq_ctrl_irq_edge: [ISPMMADR] + 8C000h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

unused_check_send_to_GP_FIFO

check_send_to_GP_FIFO

Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_send_to_GP_FIFO:** Unused
0	1h WO	**check_send_to_GP_FIFO:** Check for availability of GP FIFO. Returns 1 if a word can be send to the input selector, without it being stalled

15.8.884 reg_isel_irq_ctrl_reg_irq_edge_type (isel_irq_ctrl_reg_irq_edge)—Offset 90200h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_edge: [ISPMMADR] + 90200h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bits	31:4	3:0
Value	0000 0000 0000 0000 0000 0000 0000	0000
Field	unused_reg_irq_edge	reg_irq_edge

Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_edge:** Unused
3:0	0h RW	**reg_irq_edge:** indicates for each bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

15.8.885 reg_isel_irq_ctrl_reg_irq_mask_type (isel_irq_ctrl_reg_irq_mask)—Offset 90204h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

isel_irq_ctrl_reg_irq_mask: [ISPMMADR] + 90204h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bits	31:4	3:0
Value	0000 0000 0000 0000 0000 0000 0000	0000
Field	unused_reg_irq_mask	reg_irq_mask

Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_mask:** Unused
3:0	0h RW	**reg_irq_mask:** indicates for each bit of irq_di whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

15.8.886 reg_isel_irq_ctrl_reg_irq_status_type (isel_irq_ctrl_reg_irq_status)—Offset 90208h

Indicates for each bit whether a non-masked interrupt has been generated (value='1'). Can be cleared by writing a '1' into the the corresponding bit of the req_irq_clear register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_status: [ISPMMADR] + 90208h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bits	31:4	3	2	1	0
Value	0000 0000 0000 0000 0000 0000 0000	0	0	0	0
Field	unused_reg_irq_status	irq_stat_syncgen_eol	irq_stat_syncgen_sol	irq_stat_syncgen_eof	irq_stat_syncgen_sof

Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_status:** Unused
3	0h RO	**irq_stat_syncgen_eol:** Represents the irq status of the eol (end of line) bit generated by the sync generator
2	0h RO	**irq_stat_syncgen_sol:** Represents the irq status of the sol (start of line) bit generated by the sync generator
1	0h RO	**irq_stat_syncgen_eof:** Represents the irq status of the eof (end of frame) bit generated by the sync generator
0	0h RO	**irq_stat_syncgen_sof:** Represents the irq status of the sof (start of frame) bit generated by the sync generator

15.8.887 reg_isel_irq_ctrl_reg_irq_clear_type (isel_irq_ctrl_reg_irq_clear)—Offset 9020Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_clear: [ISPMMADR] + 9020Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_reg_irq_clear | reg_irq_clear

Bit Range	Default & Access	Description
31:4	0h RW	**unused_reg_irq_clear:** Unused
3:0	0h WO	**reg_irq_clear:** Clears (set to '0') bits in reg_irq_status. When writing a '1' into a bit of this register, the corresponding bit in the req_irq_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the req_irq_status is not affected.

15.8.888 reg_isel_irq_ctrl_reg_irq_enable_type (isel_irq_ctrl_reg_irq_enable)—Offset 90210h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

isel_irq_ctrl_reg_irq_enable: [ISPMMADR] + 90210h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

unused_check_send_to_ISP

check_send_to_ISP

Bit Range	Default & Access	Description
31:1	0h RW	**unused_check_send_to_ISP:** Unused
0	0h RO	**check_send_to_ISP:** Check for potential stalling for sending data to ISP streaming input port. Returns 1 if a send to ISP would lead to a stall. Returns 0 when there is space left in the ISP token FIFO

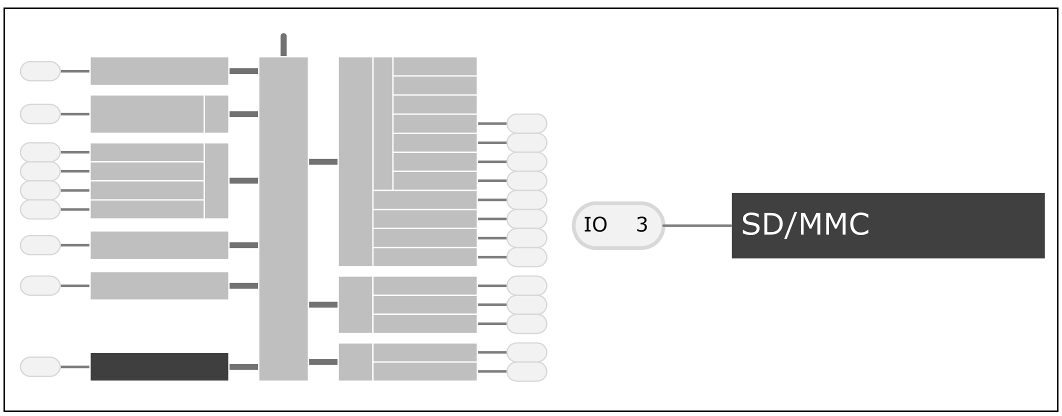
16 Storage Control Cluster (eMMC, SDIO, SD Card)

The Storage Control Cluster (SCC) consists of SDIO, SD Card and eMMC controllers to support mass storage and IO devices.

- One eMMC 4.5 interface
- One SD Card 3.0 interface
- One SDIO 3.0 interface for SDIO-based WIFI

Note: All units in the SCC support both PCI mode and ACPI mode of operation. A level shifter may be needed on the platform for SDIO 3.0 compliance. An eMMC 4.41 controller also exists but shouldn't be used.

Note: eMMC* 5.0 is functional and backward compatible on the Bay Trail platform for features included in eMMC 4.5, with no guarantees the performance is as good as eMMC* 4.5.



16.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 181. eMMC Signals

Signal Name	Direction Power	Description
MMC1_CLK	O V1P8S	**eMMC Clock** The frequency may vary between 400 kHz and 200 MHz.
MMC1_D[7:0]	I/O V1P8S	**eMMC Port Data bits 0 to 7** Bidirectional port used to transfer data to and from eMMC device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using either D[0]-D[3] or D[0]-D[7], by the MultiMedia Card controller. The MultiMedia Card includes internal pull-ups for data lines D[1]-D[7]. Immediately after entering the 4-bit mode, the card disconnects the internal pull ups of lines D[1], D[2], and D[3]. Correspondingly, immediately after entering to the 8-bit mode the card disconnects the internal pull-ups of lines D[1]-D[7].
MMC1_CMD	I/O V1P8S	**eMMC Port Command** This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
MMC1_RCOMP	-	**eMMC RCOMP** This signal is used for pre-driver slew rate compensation.
MMC1_RST#	O V1P8S	**eMMC Reset Signals** Active low to reset.

Table 182. SDIO Signals

Signal Name	Direction Power	Description
SD2_CLK	O V1P8S	**SDIO Clock** The frequency may vary between 24 and 50MHz.
SD2_D[2:0]	I/O V1P8S	**SDIO Port Data bits 0 to 2** Bidirectional port used to transfer data to and from SDIO device. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
SD2_D[3]_CD#	I/O V1P8S	**SDIO Port Data bit 3** Bidirectional port used to transfer data to and from the SDIO device. Also, **Card Detect**. Active low when device is present.
SD2_CMD	I/O V1P8S	**SDIO Port Command** This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.

Table 183. SD Card Signals

Signal Name	Direction Power	Description
SD3_CLK	O VSDIO	**SD Card Clock** The frequency may vary between 24 and 50 MHz.
SD3_D[3:0]	I/O VSDIO	**SD Card Data bits 0 to 3** Bidirectional port used to transfer data to and from SD card. By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using D[0]-D[3].
SD3_CD#	I/O V1P8S	**SD Card Detect** Active low when a card is present. Floating (pulled high with internal PU) when a card is not present.
SD3_CMD	I/O VSDIO	**SD Card Command** This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.
SD3_1P8EN	O V1P8S	**SD Card 1.8V Enable** Indicates the voltage of the SD Card to the power delivery subsystem. The default voltage (3.3 V) is requested when this signal is driven low. 1.8 V is requested when this signal is high. This voltage change applies to the SD3_V1P8V3P3_S3 (VSDIO) rail on the SoC.
SD3_RCOMP	-	**SD Card RCOMP** This signal is used for pre-driver slew rate compensation.
SD3_WP	I V1P8S	**SD Card Write Protect** Active high to protect from write.
SD3_PWREN#	O V1P8S	**SD Card Power Enable** This signal is used to enable power on a SD device.

16.2 Features

16.2.1 eMMC Interface Features

- eMMC 4.5 controller supported
- Transfers the data in 1 bit, 4 bit and 8 bit modes.
- Transfers data in the following speed classes: Baseline (1, 4, 8 bit up to 25Mhz), HS SDR/DDR (4, 8 bit up to 50Mhz) and HS200 (4, 8 bit up to 200MHz - 4.5 controller only)
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Supports MMC Plus and MMC mobile.
- Supports both round-robin and priority-based arbitration for transmit operation.
- Run-time configurabilty of channel ID bits.

16.2.2 SDIO/SD Card Interface Features

- Up to 400Mbits per second data rate using 4 parallel data lines.
- Transfers the data in 1 bit and 4 bit SD modes and SPI mode.
- Transfers the data in following UHS-I modes: HS ,DDR50 and SDR12/25.
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Designed to work with I/O cards, Read-only cards and Read/Write cards.
- Supports Read wait Control, Suspend/Resume operation.

Note: SDIO only validated with WIFI devices.

16.2.3 Storage Interfaces Overview

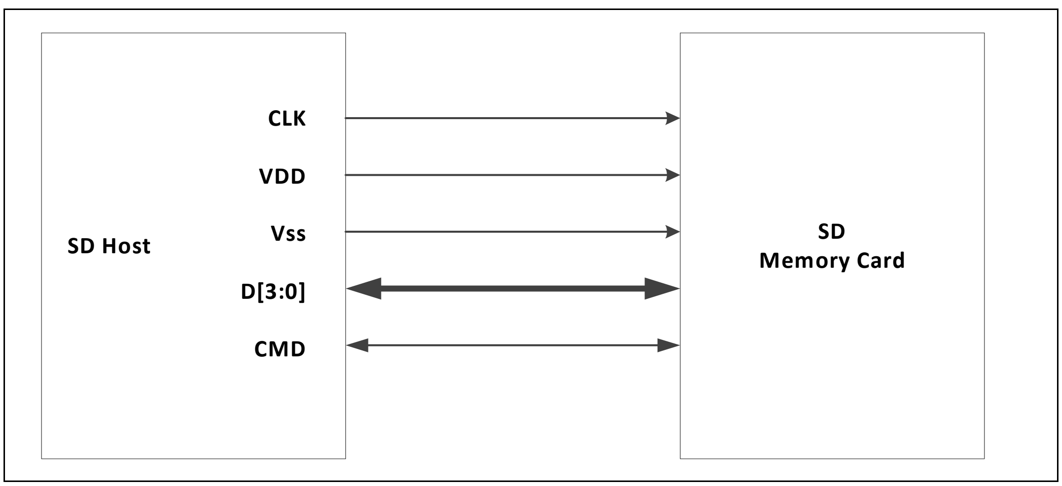
This section provides a very high level overview of the SD, SDIO, eMMC 4.5 specification. Refer to the SD and eMMC specifications for complete details.

16.2.3.1 SD Card 3.0 Bus Interface

The SD Card bus has a single master, single slaves (card), synchronous topology (refer to Figure 98). During initialization process commands are sent to the card, allowing the application to detect the card and assign logical addresses to the physical slot. All data communication in the Card Identification Mode uses the command line (CMD) only.

SD bus allows dynamic configuration of the number of data lines. After power up, by default, the SD Card will use only SD3_D[0] for data transfer. After initialization the host can change the bus width (number of active data lines). This feature allows easy trade off between hardware cost and system performance. Note that while DAT1-SD3_D[3:1] are not in use, the SoC will tri-state those signals.

Figure 98. SD Memory Card Bus Topology

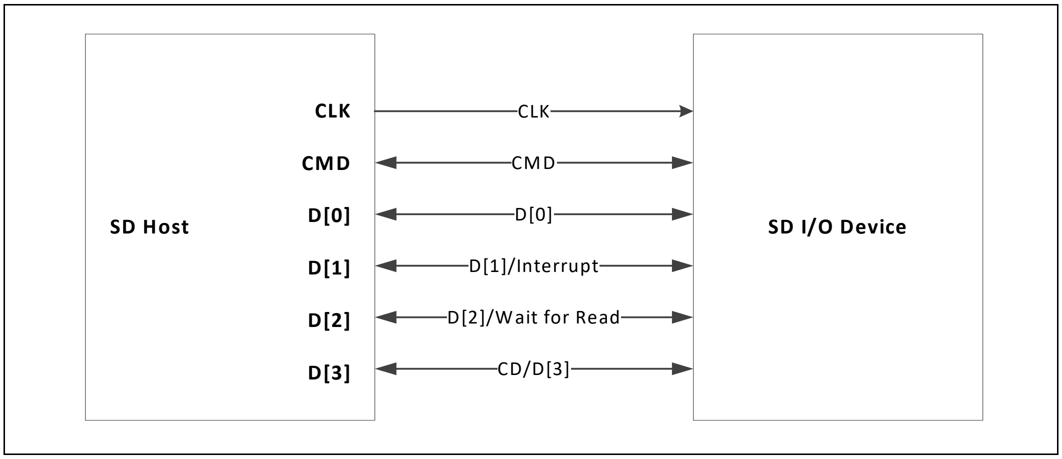


16.2.3.2 SDIO 3.0 Interface

The SDIO interface is the very much like the SD card interface. The SoC supports one SDIO device for wireless devices only (no memory card support).

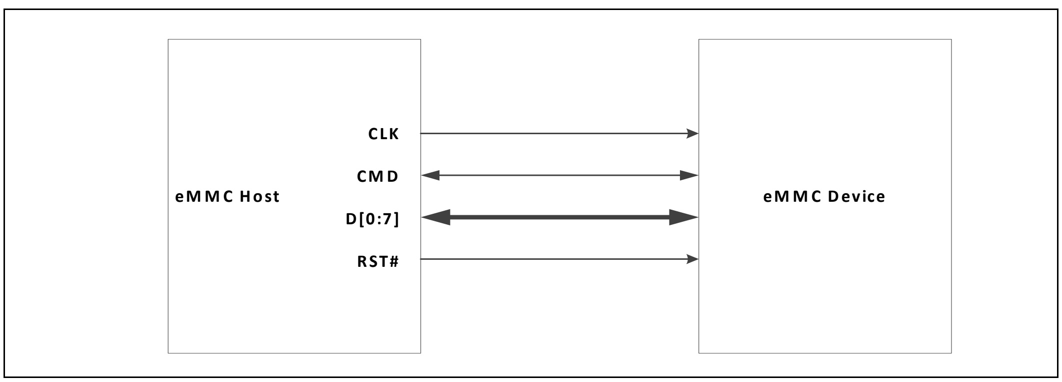
Note: SDIO interface does not support WAKE function.

Figure 99. SDIO Device Bus Topology



16.2.3.3 eMMC4.5 Interface

Figure 100. eMMC Interface



16.3 References

The controller is configured to comply with:

- SD Specification Part 01 Physical Layer Specification version 3.00, April 16, 2009
- SD Specification Part E1 SDIO Specification version 3.00, December 16, 2010
- SD Specification Part A2 SD Host Controller Standard Specification version 3.00, February 18, 2010
- SD Specification Part 03 security Specification version 1.01, April 15, 2001

16.5.1 Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DEVICEID																VENDORID															

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Device ID (DEVICEID):** Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	**Vendor ID (VENDORID):** Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

16.5.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:17, F:0] + 4h

Default: 00100000h

31 28 24 20 16 12 8 4 0

Reserved0	RMA	RCA	Reserved1	CAPLIST	INTR_STATUS	Reserved2	Reserved3	INTR_DISABLE	Reserved4	SERR_ENABLE	Reserved5	BME	MSE	Reserved6
0 0	0	0	0 0 0 0 0 0 0	1	0	0 0 0	0 0 0 0 0	0	0	0	0 0 0 0 0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	**Received Target Abort (RCA):** If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**Capabilities List (CAPLIST):** Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	**Interrupt Status (INTR_STATUS):** This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**Interrupt Disable (INTR_DISABLE):** Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	**Reserved4:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SERR# Enable (SERR_ENABLE):** This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**Bus Master Enable (BME):** If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	**Memory Space Enable (MSE):** This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	**Reserved6:** Reserved.

16.5.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:17, F:0] + 8h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CLASS_CODES																								RID							

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Class Code (CLASS_CODES):** This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	**Revision ID (RID):** Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

16.5.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:17, F:0] + Ch

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

Reserved0 | MULFNDEV | HEADERTYPE | LATTIMER | CACHELINE_SIZE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**Multifunction Device (MULFNDEV):** This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	**Header Type (HEADERTYPE):** Implements Type 0 Configuration header.
15:8	00h RO	**Latency Timer (LATTIMER):** Doesnt apply to PCI Express. Hardwired to 00h.
7:0	00h RW	**Cache Line Size (CACHELINE_SIZE):** Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

16.5.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

BASEADDR | SIZEINDICATOR | PREFETCHABLE | TYPE | MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address (BASEADDR):** Base address of the AHB device memory space. Taken from Strap values as 1s.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	**Size Indicator (Read Only) (SIZEINDICATOR):** Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s.
3	0h RO	**Prefetchable (PREFETCHABLE):** Indicates that this bar is not prefetchable.
2:1	0h RO	**Type (TYPE):** '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** 0 Indicates that this BAR is present in the memory space.

16.5.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 14h

Default: 00000000h

Bits	31:12	11:4	3	2:1	0
Value	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0	0 0	0
Field	BASEADDR1	SIZEINDICATOR1	PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Register1 (BASEADDR1):** This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0.
11:4	00h RO	**Size Indicator1 (SIZEINDICATOR1):** Always will be zero as minimum size is 4K.
3	0h RO	**Prefetchable (PREFETCHABLE1):** Indicates that this bar is not prefetchable.
2:1	0h RO	**Type (TYPE1):** '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** 0 Indicates that this BAR is present in the memory space.

16.5.7 Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 2Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SUBSYSTEMID (bits 31:16) | SUBSYSTEMVENDORID (bits 15:0)

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SUBSYSTEMID):** This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

16.5.8 Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 30h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EXPANSION_ROM_BASE (bits 31:0)

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion ROM Base Address (EXPANSION_ROM_BASE):** Value of all 0s indicates no support for Expansion ROM.

16.5.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:17, F:0] + 34h

Default: 00000080h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 0 0 0	0 0 0 0
Reserved0						CAPPTR_POWER	

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**Capabilities Pointer (CAPPTR_POWER):** Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h.

16.5.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:17, F:0] + 3Ch

Default: 00000100h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1	0 0 0 0	0 0 0 0
MAX_LAT		MIN_GNT		Reserved0	INTPIN	INTLINE	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max_Lat (MAX_LAT):** Value of 0 indicates that the device has no major requirements for the settings of latency timers.
23:16	00h RO	**Min_Gnt (MIN_GNT):** Value of 0 indicates that the device has no major requirements for the settings of latency timers.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**Interrupt Pin (INTPIN):** Each AHB IP on Bridge is a single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	**Interrupt Line (INTLINE):** Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

16.5.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 80h

Default: 48030001h

31			28				24				20				16				12				8				4				0
0	1	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
PMESUPPORT					Reserved0								VERSION			NXTCAP								POWER_CAP							

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME_Support (PMESUPPORT):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	**Reserved0:** Reserved.
18:16	3h RO	**Version (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	**Next Capability (NXTCAP):** Points to the next capability structure. This points to NULL.
7:0	01h RO	**Power Management Capability (POWER_CAP):** Indicates this is power management capability.

16.5.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + 84h

Default: 00000008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
Reserved0																PMESTATUS	Reserved1						PMEENABLE	Reserved2				NO_SOFT_RESET	Reserved3	POWERSTATE	

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PME Status (PMESTATUS):** 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PME Enable (PMEENABLE):** A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	**Reserved2:** Reserved.
3	1h RO	**No Soft Reset (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**Power State (POWERSTATE):** This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

16.5.13 General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + A0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GEN_REG_RW1

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.5.14 General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + A4h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

CAP_REG_SEL GEN_REG_RW2

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.5.15 General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + A8h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

GEN_REG_RW3

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.5.16 General Purpose Read Write Register4 (GEN_REGRW4)—Offset ACh

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + ACh

Default: 00000000h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

GEN_REG_RW4

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.5.17 General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + C0h

Default: 00000000h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

GEN_REG_INPUT_RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.5.18 Manufacturers ID Register (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:17, F:0] + F8h

Default: 00000000h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

MANID

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Manufacturer ID (MANID):** This register is brought out as straps to the top level.

16.6 SDIO for Wifi Memory Mapped IO Registers

Table 185. Summary of SDIO for Wifi Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1772	00000000h
4–5h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1773	0000h
6–7h	2	"Block Count Register (BLK_COUNT)—Offset 6h" on page 1774	0000h
8–Bh	4	"Argument 1 Register (ARGUMENT)—Offset 8h" on page 1775	00000000h
C–Dh	2	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 1775	0000h
E–Fh	2	"Command Register (CMD)—Offset Eh" on page 1777	0000h
10–13h	4	"Response Register 0 (RESPONSE0)—Offset 10h" on page 1778	00000000h
14–17h	4	"Response Register 2 (RESPONSE2)—Offset 14h" on page 1779	00000000h
18–1Bh	4	"Response Register 4 (RESPONSE4)—Offset 18h" on page 1779	00000000h
1C–1Fh	4	"Response Register 6 (RESPONSE6)—Offset 1Ch" on page 1780	00000000h
20–23h	4	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 1780	00000000h
24–27h	4	"Present State Register (PRE_STATE)—Offset 24h" on page 1781	1FFF0000h
28–28h	1	"Host Control 1 Register (HOST_CTL)—Offset 28h" on page 1784	00h
29–29h	1	"Power Control Register (PWR_CTL)—Offset 29h" on page 1785	00h
2A–2Ah	1	"Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah" on page 1786	00h
2B–2Bh	1	"Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh" on page 1787	00h
2C–2Dh	2	"Clock Control Register (CLK_CTL)—Offset 2Ch" on page 1788	0000h

16.6.1 SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

sys_adr

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDMA System Address (sys_adr): (1) SDMA System Address** This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. **(2) Argument 2** This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.

16.6.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
tx_blk_size_12	boundary			tr_blk_size											

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	**Host SDMA Buffer Boundary (boundary):** The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. • 000b = 4K bytes (Detects A11 carry out) • 001b = 8K bytes (Detects A12 carry out) • 010b = 16K Bytes (Detects A13 carry out) • 011b = 32K Bytes (Detects A14 carry out) • 100b = 64K bytes (Detects A15 carry out) • 101b = 128K Bytes (Detects A16 carry out) • 110b = 256K Bytes (Detects A17 carry out) • 111b = 512K Bytes (Detects A18 carry out)
11:0	000h RW	**Transfer Block Size (tr_blk_size):** This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 *Determining Buffer Block Length*). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. • 0800h = 2048 Bytes • . . . • 0200h = 512 Bytes • 01FFh = 511 Bytes • . . . • 0004h = 4 Bytes • 0003h = 3 Bytes • 0002h = 2 Bytes • 0001h = 1 Byte • 0000h = No data transfer

16.6.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

blk_count

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**Blocks Count For Current Transfer (blk_count):** This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count. • 0000h = Stop Count • 0001h = 1 block • 0002h = 2 blocks • . . . • FFFFh = 65535 blocks

16.6.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

argument

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Argument 1 (argument):** The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.6.5 Transfer Mode Register (TX_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
rsvd							boot_en	spi_mode	cmd_comp_ata	blk_sel	data_tr_dir	auto_cmd_en		blk_count_en	dma_en

Bit Range	Default & Access	Field Name (ID): Description
15:9	00h RO	**Reserved (rsvd):** Reserved.
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data Transfer Direction Select (data_tr_dir):** This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. • 1 = Read (Card to Host) • 0 = Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**Block Count Enable (blk_count_en):** This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. • 1 = Enable • 0 = Disable
0	0b RW	**DMA Enable (dma_en):** This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). • 1 = DMA Data transfer • 0 = No data transfer or Non DMA data transfer

16.6.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

Offset: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
rsvd		cmd_index						cmd_type		data_pr_sel	cmd_index_chk_en	cmd_crc_chk_en	reserved	resp_type_sel	

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Rsvd (rsvd):** Reserved.
13:8	0h RW	**Command Index (cmd_index):** These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**Command Type (cmd_type):** There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. **(1) Suspend Command** If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). **(2) Resume Command** The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. **(3) Abort Command** If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). • 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR • 10b = Resume -- CMD52 for writing 'Function Select' in CCCR • 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR • 00b = Normal -- Other commands
5	0b RW	**Data Present Select (data_pr_sel):** This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. • 1 = Data Present • 0 = No Data Present

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**Command Index Check Enable (cmd_index_chk_en):** If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. • 1 = Enable • 0 = Disable
3	0b RW	**Command CRC Check Enable (cmd_crc_chk_en):** If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) • 1 = Enable • 0 = Disable
2	0b RO	**Reserved (reserved):** Reserved.
1:0	0h RW	**Response Type Select (resp_type_sel):** • 00 = No Response • 01 = Response Length 136 • 10 = Response Length 48 • 11 = Response Length 48 check Busy after response

16.6.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

0	0	cmd_inhibit_cmd

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (reserved2):** Reserved.
28:25	1111b RO	**DAT Line Signal Level (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. • D28 - DAT[7] • D27 - DAT[6] • D26 - DAT[5] • D25 - DAT[4]
24	1b RO	**CMD Line Signal Level (cmd_ln_sig_lvl):** This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	**DAT[3:0] Line Signal Level (data_ln_sig_lvl):** This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. • D23 = DAT[3] • D22 = DAT[2] • D21 = DAT[1] • D20 = DAT[0]
19	1b RO	**Write Protect Switch Pin Level (wr_prot_sw_pin_lvl):** The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP# pin. • 1 = Write enabled (SDWP#=1) • 0 = Write protected (SDWP#=0)
18	1b RO	**Card Detect Pin Level (crd_det_pin_lvl):** This bit reflects the inverse value of the SDCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. • 1 = Card present (SDCD#=0) • 0 = No card present (SDCD#=1)
17	1b RO	**Card State Stable (crd_st_stable):** This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. No Card state can be detected by this bit being set to 1 while Card Inserted is set to 0. The Software Reset For All in the Software Reset register shall not affect this bit. • 1 = No Card or Inserted • 0 = Reset or Debouncing

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	**Card Inserted (crd_ins):** This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power. • 1 = Card Inserted • 0 = Reset or Debouncing or No Card
15:12	0h RO	**Reserved1 (reserved1):** Reserved.
11	0b RO	**Buffer Read Enable (buf_rd_en):** This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt. • 1 = Read enable • 0 = Read disable
10	0b RO	**Buffer Write Enable (buf_wr_en):** This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register. • 1 = Write enable • 0 = Write disable
9	0b RO	**Read Transfer Active (rd_tx_active):** This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions: • After the end bit of the read command. • When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared to 0 for either of the following conditions: • When the last data block as specified by block length is transferred to the System. • In case of ADMA2, end of read operation is designated by Descriptor Table. • When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. A Transfer Complete interrupt is generated when this bit changes to 0. • 1 = Transferring data • 0 = No valid data

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	**Write Transfer Active (wr_tx_active):** This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases: • After the end bit of the write command. • When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared in either of the following cases: • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table. • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy. • 1 Transferring data • 0 No valid data
7:3	00h RO	**Reserved (reserved):** Reserved.
2	0b RO	**DAT Line Active (dat_ln_active):** This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases: • After the end bit of the read command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. This bit shall be cleared in either of the following cases: • When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases: • After the end bit of the write command. • When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. This bit shall be cleared in either of the following cases: • When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request. (c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13. • 1 = DAT Line Active • 0 = DAT Line Inactive

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	**Command Inhibit (DAT) (cmd_inhibit_dat):** This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. **Note:** The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. • 1 Cannot issue command which uses the DAT line • 0 Can issue command which uses the DAT line
0	0b RO	**Command Inhibit (CMD) (cmd_inhibit_cmd):** Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set. • 1 Cannot issue command • 0 Can issue command using only CMD line

16.6.13 Host Control 1 Register (HOST_CTL)—Offset 28h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lvl	sd8_bit_mode	dma_sel		hi_spd_en	data_tx_wid	led_ctl

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**Card Detect Signal Selection (crd_det_sig_sel):** This bit selects source for the card detection. • 1 = The Card Detect Test Level is selected (for test purposes) • 0 = SDCD# is selected (for normal use) When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during the period of debouncing.

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	**Card Detect Test Level (crd_det_tst_lvl):** This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. • 1 = Card Inserted • 0 = No Card
5	0b RW	**SD8 Bit Mode (sd8_bit_mode):** This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	**DMA Select (dma_sel):** One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. • 00 = SDMA is selected • 01 = Reserved (New assignment is not allowed) • 10 = 32-bit Address ADMA2 is selected • 11 = Reserved (will be modified by Version 4.00)
2	0b RW	**High Speed Enable (hi_spd_en):** This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. • 1 = 4-bit mode • 0 = 1-bit mode
1	0b RW	**Data Transfer Width (data_tx_wid):** Reserved.
0	0b RW	**LED Control (led_ctl):** This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. • 1 = 4-bit mode • 0 = 1-bit mode

16.6.14 Power Control Register (PWR_CTL)—Offset 29h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 29h

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**HW Reset (hw_rst):** Reserved.
3:1	0h RW	**SD Bus Voltage Select (sd_bus_volt_sel):** By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the Voltage Support bits in the Capabilities register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage. • 111b = 3.3V (Typ.) • 110b = 3.0V (Typ.) • 101b = 1.8V (Typ.) • 100b 000b Reserved
0	0b RW	**SD Bus Power (sd_bus_pwr):** Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. • 1 = Power on • 0 = Power off

16.6.15 Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 2Ah

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (rsvd):** Reserved.
4	0b RW	**DRIVE_CCSD (drive_ccsd):** If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**Interrupt at Block Gap (int_blk_gap):** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. • 1 = Enabled • 0 = Disabled
2	0b RW	**Read Wait Control (rd_wait_ctl):** The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. • 1 = Enable Read Wait Control • 0 = Disable Read Wait Control
1	0b RW	**Continue Request (cont_req):** This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: • In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. • In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. • 1 = Restart • 0 = Not affect
0	0b RW	**Stop at Block Gap Request (stp_blk_gap_req):** This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12. • 1 = Stop • 0 = Transfer

16.6.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 2Bh

sdclk_freq_sel								upper_sdclk_freq_sel		rsvd			sd_clk_en	int_clk_stable	int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	**SDCLK Frequency Select (sdclk_freq_sel):** This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. **(1) 8-bit Divided Clock Mode** This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. **(1) 8-bit Divided Clock Mode** • 80h = base clock divided by 256 • 40h = base clock divided by 128 • 20h = base clock divided by 64 • 10h = base clock divided by 32 • 08h = base clock divided by 16 • 04h = base clock divided by 8 • 02h = base clock divided by 4 • 01h = base clock divided by 2 • 00h = base clock(10MHz and up) Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register. • 400KHz divider value • 25MHz divider value • 50MHz divider value According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz. **(2) 10-bit Divided Clock Mode** Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported. • 3FFh = 1/2046 Divided Clock • N = 1/2N Divided Clock (Duty 50%) • 002h = 1/4 Divided Clock • 001h = 1/2 Divided Clock • 000h = Base Clock (10MHz and up) • 3FFh = Base Clock * M / 1024 • .... • N - 1 = Base Clock * M / N • .... • 002h = Base Clock * M / 3 • 001h = Base Clock * M / 2 • 000h = Base Clock * M This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel):** Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	**Rsvd (rsvd):** Reserved.
2	0b RW	**SD Clock Enable (sd_clk_en):** The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. • 1 = Enable • 0 = Disable
1	0b RO	**Internal Clock Stable (int_clk_stable):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. **Note:** This is useful when using PLL for a clock oscillator that requires setup time. • 1 = Ready • 0 = Not Ready
0	0b RW	**Internal Clock Enable (int_clk_en):** This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. • 1 = Oscillate • 0 = Stop

16.6.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 2Eh

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**Software Reset For DAT Line (sw_rst_dat_ln):** Only part of data circuit is reset. DMA circuit is also reset. The following registers and bits are cleared by this bit: Buffer Data Port register • Buffer is cleared and initialized. Present State register • Buffer Read Enable • Buffer Write Enable • Read Transfer Active • Write Transfer Active • DAT Line Active • Command Inhibit (DAT) Block Gap Control register • Continue Request • Stop At Block Gap Request Normal Interrupt Status register • Buffer Read Ready • Buffer Write Ready • DMA Interrupt • Block Gap Event • Transfer Complete • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.
1	0b RW	**Software Reset For CMD Line (sw_rst_cmd_ln):** Only part of command circuit is reset. The following registers and bits are cleared by this bit: Present State register • Command Inhibit (CMD) Normal Interrupt Status register • Command Complete • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.
0	0b RW	**Software Reset For All (sw_rst_all):** This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card. • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.

16.6.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
err_int	boot_ter_int	boot_ck_rcv	re_tune	int_c	int_b	int_a	crd_int	crd_rm	crd_ins	buf_rd_rdy	buf_wr_rdy	dma_int	blk_gap_event	tx_comp	cmd_comp

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	**Error Interrupt (err_int):** If any of the bits in the Error Interrupt Status register are set, then this bit is set. Therefore the Host Driver can efficiently test for an error by checking this bit first. This bit is read only. • 1 = Error • 0 = No Error
14	0b RW/1C	**BOOT_TER_INT (boot_ter_int):** boot ter int
13	0b RW/1C	**BOOT_ACK_RCV (boot_ck_rcv):** boot ack rcv
12	0b RO	**Re-Tuning Event (re_tune):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. • 1 Re-Tuning should be performed • 0 Re-Tuning is not required
11	0b RO	**INT_C (int_c):** This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_C is detected • 0 = No interrupt is detected
10	0b RO	**INT_B (int_b):** This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_B is detected • 0 = No interrupt is detected
9	0b RO	**INT_A (int_a):** This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_A is detected • 0 = No interrupt is detected

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	**Card Interrupt (crd_int):** Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts. • 1 = Generate Card Interrupt • 0 = No Card Interrupt
7	0b RW/1C	**Card Removal (crd_rm):** This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated. • 1 = Card removed • 0 = Card state stable or Debouncing
6	0b RW/1C	**Card Insertion (crd_ins):** This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated. • 1 Card inserted • 0 Card state stable or Debouncing
5	0b RW/1C	**Buffer Read Ready (buf_rd_rdy):** This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution. • 1 = Ready to read buffer • 0 = Not ready to read buffer
4	0b RW/1C	**Buffer Write Ready (buf_wr_rdy):** This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register. • 1 = Ready to write buffer • 0 = Not ready to write buffer
3	0b RW/1C	**DMA Interrupt (dma_int):** This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete. • 1 = DMA Interrupt is generated • 0 = No DMA Interrupt
2	0b RW/1C	**Block Gap Event (blk_gap_event):** If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. **(1) In the case of a Read Transaction** This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p]**(1) In the case of a Write Transaction** This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events. • 1 = Transaction stopped at block gap • 0 = No Block Gap Event

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	**Transfer Complete (tx_comp):** This bit is set when a read / write transfer and a command with busy is completed. **(1) In the case of a Read Transaction** This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. **(2) In the case of a Write Transaction** This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. **(3) In the case of a command with busy** This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error. • 1 = Command execution is completed • 0 = Not complete While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.
0	0b RW/1C	**Command Complete (cmd_comp):** This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec. • 1 = Command complete • 0 = No command complete

16.6.21 Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 32h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
vend_spec_err_status	boot_cmd_timeout_err	ceata_err	tgt_rsp_err	rsvd		adma_err	cmd12_err	cur_limit_err	data_end_bit_err	data_crc_err	data_timeout_err	cmd_index_err	cmd_end_bit_err	cmd_crc_err	cmd_timeout_err

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	**Vendor Specific Error Status (vend_spec_err_status):** Reserved.
14	0b RW	**Boot Command Timeout Error (boot_cmd_timeout_err):** Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	**CEATA Error (ceata_err):** Occurs when ATA command termination has occured due to an error condition the device has encountered.
12	0b RW	**Target Response Error (tgt_rsp_err):** Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	**Reserved (rsvd):** Reserved.
9	0b RW	**ADMA Error (adma_err):** This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. **ADMA Error State** in the ADMA Error Status indicates that an error occurs in ST_FDS state.The Host Driver may find that Valid bit is not set at the error descriptor. • 0 = error • 1 = no error
8	0b RW	**Auto CMD12 Error (cmd12_err):** Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. • 1 = error • 0 = no error
7	0b RW	**Current Limit Error (cur_limit_err):** By setting the **SD Bus Power** bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. • 1 = power fail • 0 = no error
6	0b RW	**Data End Bit Error (data_end_bit_err):** Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. • 1 = error • 0 = no error
5	0b RW	**Data CRC Error (data_crc_err):** Occurs when detecting CRC error when transferring read data which uses the **DAT** line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	**Data Timeout Error (data_timeout_err):** This bit is set when detecting one of following timeout conditions. • Busy timeout for R1b,R5b type • Busy timeout after Write CRC status • Write CRC Status timeout • Read Data timeout • 1 = time out • 0 = no error

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**Command Index Error (cmd_index_err):** This bit is set if a Command Index error occurs in the command response. • 1 = error • 0 = no error
2	0b RW	**Command End Bit Error (cmd_end_bit_err):** This bit is set when detecting that the end bit of a command response is 0. • 1 = End Bit Error generated • 0 = no error
1	0b RW	**Command CRC Error (cmd_crc_err): Command CRC Error** is generated in two cases. If a response is returned and the **Command Timeout Error** is set to 0(indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between **Command CRC Error** and **Command Timeout Error**). • 1 = CRC Error Generated. • 0 = no error
0	0b RW	**Command Timeout Error (cmd_timeout_err):** This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case **Command CRC Error** shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and **Command CRC Error**) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. • 1 = time out • 0 = no Error

16.6.22 Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 34h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:17, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**Preset Value (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. • 1 = Automatic Selection by Preset Value are Enabled • 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**Asynchronous Interrupt (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this be to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete. • 1 = Enabled • 0 = Disabled

Bit Range	Default & Access	Field Name (ID): Description

16.6.31 Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

16.6.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST_CADR: This sate is never set because do not generate ADMA error in this state.

- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 54h

DEVICEID				VENDORID			

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Device ID (DEVICEID):** Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	**Vendor ID (VENDORID):** Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

16.7.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 4h

Default: 00100000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Reserved0		RMA	RCA	Reserved1							CAPLIST	INTR_STATUS	Reserved2			Reserved3					INTR_DISABLE	Reserved4	SERR_ENABLE	Reserved5					BME	MSE	Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	**Received Target Abort (RCA):** If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**Capabilities List (CAPLIST):** Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	**Interrupt Status (INTR_STATUS):** This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**Interrupt Disable (INTR_DISABLE):** Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	**Reserved4:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SERR# Enable (SERR_ENABLE):** This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**Bus Master Enable (BME):** If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	**Memory Space Enable (MSE):** This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	**Reserved6:** Reserved.

16.7.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 8h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

CLASS_CODES | RID

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Class Code (CLASS_CODES):** This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	**Revision ID (RID):** Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

16.7.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Reserved0								MULFNDEV	HEADERTYPE							LATTIMER								CACHELINE_SIZE							

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**Multifunction Device (MULFNDEV):** This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	**Header Type (HEADERTYPE):** Implements Type 0 Configuration header.
15:8	00h RO	**Latency Timer (LATTIMER):** Doesnt apply to PCI Express. Hardwired to 00h.
7:0	00h RW	**Cache Line Size (CACHELINE_SIZE):** Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

16.7.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BASEADDR																				SIZEINDICATOR								PREFETCHABLE	TYPE		MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address (BASEADDR):** Base address of the AHB device memory space. Taken from Strap values as 1s.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	**Size Indicator (Read Only) (SIZEINDICATOR):** Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s.
3	0h RO	**Prefetchable (PREFETCHABLE):** Indicates that this bar is not prefetchable.
2:1	0h RO	**Type (TYPE):** '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** 0 Indicates that this BAR is present in the memory space.

16.7.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 14h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BASEADDR1																				SIZEINDICATOR1								PREFETCHABLE1	TYPE1		MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Register1 (BASEADDR1):** This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0.
11:4	00h RO	**Size Indicator1 (SIZEINDICATOR1):** Always will be zero as minimum size is 4K.
3	0h RO	**Prefetchable (PREFETCHABLE1):** Indicates that this bar is not prefetchable.
2:1	0h RO	**Type (TYPE1):** '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** 0 Indicates that this BAR is present in the memory space.

16.7.7 Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 2Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: SUBSYSTEMID (bits 31:16), SUBSYSTEMVENDORID (bits 15:0)

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SUBSYSTEMID):** This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

16.7.8 Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 30h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: EXPANSION_ROM_BASE (bits 31:0)

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion ROM Base Address (EXPANSION_ROM_BASE):** Value of all 0s indicates no support for Expansion ROM.

16.7.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 34h

Default: 00000080h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
Reserved0																								CAPPTR_POWER							

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**Capabilities Pointer (CAPPTR_POWER):** Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h.

16.7.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 3Ch

Default: 00000100h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
MAX_LAT								MIN_GNT								Reserved0				INTPIN				INTLINE							

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max_Lat (MAX_LAT):** Value of 0 indicates that the device has no major requirements for the settings of latency timers.
23:16	00h RO	**Min_Gnt (MIN_GNT):** Value of 0 indicates that the device has no major requirements for the settings of latency timers.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**Interrupt Pin (INTPIN):** Each AHB IP on Bridge is a single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	**Interrupt Line (INTLINE):** Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

16.7.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register (Size: 32 bits)   **Offset:** [B:0, D:18, F:0] + 80h

Default: 48030001h

31			28				24				20				16				12				8				4				0
0	1	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

PMESUPPORT | Reserved0 | VERSION | NXTCAP | POWER_CAP

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME_Support (PMESUPPORT):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	**Reserved0:** Reserved.
18:16	3h RO	**Version (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	**Next Capability (NXTCAP):** Points to the next capability structure. This points to NULL.
7:0	01h RO	**Power Management Capability (POWER_CAP):** Indicates this is power management capability.

16.7.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)   **Offset:** [B:0, D:18, F:0] + 84h

Default: 00000008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

Reserved0 | PMESTATUS | Reserved1 | PMEENABLE | Reserved2 | NO_SOFT_RESET | Reserved3 | POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PME Status (PMESTATUS):** 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PME Enable (PMEENABLE):** A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	**Reserved2:** Reserved.
3	1h RO	**No Soft Reset (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**Power State (POWERSTATE):** This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

16.7.13 General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:18, F:0] + A0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GEN_REG_RW1

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.7.14 General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + A4h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CAP_REG_SEL | GEN_REG_RW2

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.7.15 General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + A8h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GEN_REG_RW3

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.7.16 General Purpose Read Write Register4 (GEN_REGRW4)—Offset ACh

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + ACh

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

GEN_REG_RW4

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.7.17 General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + C0h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

GEN_REG_INPUT_RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.7.18 Manufacturers ID Register (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + F8h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

MANID

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Manufacturer ID (MANID):** This register is brought out as straps to the top level.

16.8 SD Card Memory Mapped IO Registers

Table 187. Summary of SD Card Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1828	00000000h
4–5h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1829	0000h
6–7h	2	"Block Count Register (BLK_COUNT)—Offset 6h" on page 1830	0000h
8–Bh	4	"Argument 1 Register (ARGUMENT)—Offset 8h" on page 1831	00000000h
C–Dh	2	"Transfer Mode Register (TX_MODE)—Offset Ch" on page 1831	0000h
E–Fh	2	"Command Register (CMD)—Offset Eh" on page 1833	0000h
10–13h	4	"Response Register 0 (RESPONSE0)—Offset 10h" on page 1834	00000000h
14–17h	4	"Response Register 2 (RESPONSE2)—Offset 14h" on page 1835	00000000h
18–1Bh	4	"Response Register 4 (RESPONSE4)—Offset 18h" on page 1835	00000000h
1C–1Fh	4	"Response Register 6 (RESPONSE6)—Offset 1Ch" on page 1836	00000000h
20–23h	4	"Buffer Data Port Register (BUF_DATA_PORT)—Offset 20h" on page 1836	00000000h
24–27h	4	"Present State Register (PRE_STATE)—Offset 24h" on page 1837	1FFF0000h
28–28h	1	"Host Control 1 Register (HOST_CTL)—Offset 28h" on page 1840	00h
29–29h	1	"Power Control Register (PWR_CTL)—Offset 29h" on page 1841	00h
2A–2Ah	1	"Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah" on page 1842	00h
2B–2Bh	1	"Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh" on page 1843	00h
2C–2Dh	2	"Clock Control Register (CLK_CTL)—Offset 2Ch" on page 1844	0000h
2E–2Eh	1	"Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh" on page 1846	00h
2F–2Fh	1	"Software Reset Register (SW_RST)—Offset 2Fh" on page 1847	00h
30–31h	2	"Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h" on page 1848	0000h
32–33h	2	"Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h" on page 1851	0000h
34–35h	2	"Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h" on page 1853	0000h
36–37h	2	"Error Interrupt Status Enable Register (ERR_INT_STAT_EN)—Offset 36h" on page 1855	0000h
38–39h	2	"Normal Interrupt Signal Enable Register (NRM_INT_SIG_EN)—Offset 38h" on page 1856	0000h
3A–3Bh	2	"Error Interrupt Signal Enable Register (ERR_INT_SIG_EN)—Offset 3Ah" on page 1857	0000h
3C–3Fh	4	"Auto CMD12 Error Status Register and Host Control 2 Register (CMD12_ERR_STAT_HOST_CTRL_2)—Offset 3Ch" on page 1859	00000000h

16.8.1 SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

sys_adr

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDMA System Address (sys_adr): (1) SDMA System Address** This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. **(2) Argument 2** This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.

16.8.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
tx_blk_size_12	boundary			tr_blk_size											

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	**Host SDMA Buffer Boundary (boundary):** The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. • 000b = 4K bytes (Detects A11 carry out) • 001b = 8K bytes (Detects A12 carry out) • 010b = 16K Bytes (Detects A13 carry out) • 011b = 32K Bytes (Detects A14 carry out) • 100b = 64K bytes (Detects A15 carry out) • 101b = 128K Bytes (Detects A16 carry out) • 110b = 256K Bytes (Detects A17 carry out) • 111b = 512K Bytes (Detects A18 carry out)
11:0	000h RW	**Transfer Block Size (tr_blk_size):** This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 *Determining Buffer Block Length*). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. • 0800h = 2048 Bytes • . . . • 0200h = 512 Bytes • 01FFh = 511 Bytes • . . . • 0004h = 4 Bytes • 0003h = 3 Bytes • 0002h = 2 Bytes • 0001h = 1 Byte • 0000h = No data transfer

16.8.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

blk_count

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**Blocks Count For Current Transfer (blk_count):** This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count. • 0000h = Stop Count • 0001h = 1 block • 0002h = 2 blocks • . . . • FFFFh = 65535 blocks

16.8.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

argument																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Argument 1 (argument):** The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.8.5 Transfer Mode Register (TX_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
rsvd							boot_en	spi_mode	cmd_comp_ata	blk_sel	data_tr_dir	auto_cmd_en		blk_count_en	dma_en

Bit Range	Default & Access	Field Name (ID): Description
15:9	00h RO	**Reserved (rsvd):** Reserved.
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data Transfer Direction Select (data_tr_dir):** This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. • 1 = Read (Card to Host) • 0 = Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**Block Count Enable (blk_count_en):** This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. • 1 = Enable • 0 = Disable
0	0b RW	**DMA Enable (dma_en):** This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). • 1 = DMA Data transfer • 0 = No data transfer or Non DMA data transfer

16.8.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

Offset: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
rsvd		cmd_index						cmd_type		data_pr_sel	cmd_index_chk_en	cmd_crc_chk_en	reserved	resp_type_sel	

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Rsvd (rsvd):** Reserved.
13:8	0h RW	**Command Index (cmd_index):** These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**Command Type (cmd_type):** There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. **(1) Suspend Command** If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). **(2) Resume Command** The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. **(3) Abort Command** If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). • 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR • 10b = Resume -- CMD52 for writing 'Function Select' in CCCR • 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR • 00b = Normal -- Other commands
5	0b RW	**Data Present Select (data_pr_sel):** This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. • 1 = Data Present • 0 = No Data Present

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**Command Index Check Enable (cmd_index_chk_en):** If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. • 1 = Enable • 0 = Disable
3	0b RW	**Command CRC Check Enable (cmd_crc_chk_en):** If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) • 1 = Enable • 0 = Disable
2	0b RO	**Reserved (reserved):** Reserved.
1:0	0h RW	**Response Type Select (resp_type_sel):** • 00 = No Response • 01 = Response Length 136 • 10 = Response Length 48 • 11 = Response Length 48 check Busy after response

16.8.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

2	0	dat_ln_active
1	0	cmd_inhibit_dat
0	0	cmd_inhibit_cmd

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (reserved2):** Reserved.
28:25	1111b RO	**DAT Line Signal Level (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. • D28 - DAT[7] • D27 - DAT[6] • D26 - DAT[5] • D25 - DAT[4]
24	1b RO	**CMD Line Signal Level (cmd_ln_sig_lvl):** This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	**DAT[3:0] Line Signal Level (data_ln_sig_lvl):** This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. • D23 = DAT[3] • D22 = DAT[2] • D21 = DAT[1] • D20 = DAT[0]
19	1b RO	**Write Protect Switch Pin Level (wr_prot_sw_pin_lvl):** The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP# pin. • 1 = Write enabled (SDWP#=1) • 0 = Write protected (SDWP#=0)
18	1b RO	**Card Detect Pin Level (crd_det_pin_lvl):** This bit reflects the inverse value of the SDCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. • 1 = Card present (SDCD#=0) • 0 = No card present (SDCD#=1)
17	1b RO	**Card State Stable (crd_st_stable):** This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. No Card state can be detected by this bit being set to 1 while Card Inserted is set to 0. The Software Reset For All in the Software Reset register shall not affect this bit. • 1 = No Card or Inserted • 0 = Reset or Debouncing

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	**Card Inserted (crd_ins):** This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power. • 1 = Card Inserted • 0 = Reset or Debouncing or No Card
15:12	0h RO	**Reserved1 (reserved1):** Reserved.
11	0b RO	**Buffer Read Enable (buf_rd_en):** This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt. • 1 = Read enable • 0 = Read disable
10	0b RO	**Buffer Write Enable (buf_wr_en):** This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register. • 1 = Write enable • 0 = Write disable
9	0b RO	**Read Transfer Active (rd_tx_active):** This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions: • After the end bit of the read command. • When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared to 0 for either of the following conditions: • When the last data block as specified by block length is transferred to the System. • In case of ADMA2, end of read operation is designated by Descriptor Table. • When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. A Transfer Complete interrupt is generated when this bit changes to 0. • 1 = Transferring data • 0 = No valid data

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	**Write Transfer Active (wr_tx_active):** This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases: • After the end bit of the write command. • When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared in either of the following cases: • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table. • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy. • 1 Transferring data • 0 No valid data
7:3	00h RO	**Reserved (reserved):** Reserved.
2	0b RO	**DAT Line Active (dat_ln_active):** This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases: • After the end bit of the read command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. This bit shall be cleared in either of the following cases: • When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases: • After the end bit of the write command. • When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. This bit shall be cleared in either of the following cases: • When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request. (c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13. • 1 = DAT Line Active • 0 = DAT Line Inactive

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	**Command Inhibit (DAT) (cmd_inhibit_dat):** This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. **Note:** The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. • 1 Cannot issue command which uses the DAT line • 0 Can issue command which uses the DAT line
0	0b RO	**Command Inhibit (CMD) (cmd_inhibit_cmd):** Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set. • 1 Cannot issue command • 0 Can issue command using only CMD line

16.8.13 Host Control 1 Register (HOST_CTL)—Offset 28h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lvl	sd8_bit_mode	dma_sel		hi_spd_en	data_tx_wid	led_ctl

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**Card Detect Signal Selection (crd_det_sig_sel):** This bit selects source for the card detection. • 1 = The Card Detect Test Level is selected (for test purposes) • 0 = SDCD# is selected (for normal use) When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/ Signal Enable should be disabled during the period of debouncing.

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	**Card Detect Test Level (crd_det_tst_lvl):** This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. • 1 = Card Inserted • 0 = No Card
5	0b RW	**SD8 Bit Mode (sd8_bit_mode):** This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	**DMA Select (dma_sel):** One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. • 00 = SDMA is selected • 01 = Reserved (New assignment is not allowed) • 10 = 32-bit Address ADMA2 is selected • 11 = Reserved (will be modified by Version 4.00)
2	0b RW	**High Speed Enable (hi_spd_en):** This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. • 1 = 4-bit mode • 0 = 1-bit mode
1	0b RW	**Data Transfer Width (data_tx_wid):** Reserved.
0	0b RW	**LED Control (led_ctl):** This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. • 1 = 4-bit mode • 0 = 1-bit mode

16.8.14 Power Control Register (PWR_CTL)—Offset 29h

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 29h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7			4				0

rsvd			hw_rst	sd_bus_volt_sel			sd_bus_pwr

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Rsvd (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**HW Reset (hw_rst):** Reserved.
3:1	0h RW	**SD Bus Voltage Select (sd_bus_volt_sel):** By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the Voltage Support bits in the Capabilities register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage. • 111b = 3.3V (Typ.) • 110b = 3.0V (Typ.) • 101b = 1.8V (Typ.) • 100b 000b Reserved
0	0b RW	**SD Bus Power (sd_bus_pwr):** Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. • 1 = Power on • 0 = Power off

16.8.15 Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 2Ah

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (rsvd):** Reserved.
4	0b RW	**DRIVE_CCSD (drive_ccsd):** If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**Interrupt at Block Gap (int_blk_gap):** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. • 1 = Enabled • 0 = Disabled
2	0b RW	**Read Wait Control (rd_wait_ctl):** The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. • 1 = Enable Read Wait Control • 0 = Disable Read Wait Control
1	0b RW	**Continue Request (cont_req):** This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: • In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. • In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. • 1 = Restart • 0 = Not affect
0	0b RW	**Stop at Block Gap Request (stp_blk_gap_req):** This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12. • 1 = Stop • 0 = Transfer

16.8.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + 2Bh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

sdclk_freq_sel								upper_sdclk_freq_sel		rsvd			sd_clk_en	int_clk_stable	int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	**SDCLK Frequency Select (sdclk_freq_sel):** This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. **(1) 8-bit Divided Clock Mode** This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. **(1) 8-bit Divided Clock Mode** • 80h = base clock divided by 256 • 40h = base clock divided by 128 • 20h = base clock divided by 64 • 10h = base clock divided by 32 • 08h = base clock divided by 16 • 04h = base clock divided by 8 • 02h = base clock divided by 4 • 01h = base clock divided by 2 • 00h = base clock(10MHz and up) Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register. • 400KHz divider value • 25MHz divider value • 50MHz divider value According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz. **(2) 10-bit Divided Clock Mode** Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported. • 3FFh = 1/2046 Divided Clock • N = 1/2N Divided Clock (Duty 50%) • 002h = 1/4 Divided Clock • 001h = 1/2 Divided Clock • 000h = Base Clock (10MHz and up) • 3FFh = Base Clock * M / 1024 • .... • N - 1 = Base Clock * M / N • .... • 002h = Base Clock * M / 3 • 001h = Base Clock * M / 2 • 000h = Base Clock * M This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel):** Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	**Rsvd (rsvd):** Reserved.
2	0b RW	**SD Clock Enable (sd_clk_en):** The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. • 1 = Enable • 0 = Disable
1	0b RO	**Internal Clock Stable (int_clk_stable):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. **Note:** This is useful when using PLL for a clock oscillator that requires setup time. • 1 = Ready • 0 = Not Ready
0	0b RW	**Internal Clock Enable (int_clk_en):** This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. • 1 = Oscillate • 0 = Stop

16.8.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**Software Reset For DAT Line (sw_rst_dat_ln):** Only part of data circuit is reset. DMA circuit is also reset. The following registers and bits are cleared by this bit: Buffer Data Port register • Buffer is cleared and initialized. Present State register • Buffer Read Enable • Buffer Write Enable • Read Transfer Active • Write Transfer Active • DAT Line Active • Command Inhibit (DAT) Block Gap Control register • Continue Request • Stop At Block Gap Request Normal Interrupt Status register • Buffer Read Ready • Buffer Write Ready • DMA Interrupt • Block Gap Event • Transfer Complete • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.
1	0b RW	**Software Reset For CMD Line (sw_rst_cmd_ln):** Only part of command circuit is reset. The following registers and bits are cleared by this bit: Present State register • Command Inhibit (CMD) Normal Interrupt Status register • Command Complete • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.
0	0b RW	**Software Reset For All (sw_rst_all):** This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card. • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.

16.8.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	**Error Interrupt (err_int):** If any of the bits in the Error Interrupt Status register are set, then this bit is set. Therefore the Host Driver can efficiently test for an error by checking this bit first. This bit is read only. • 1 = Error • 0 = No Error
14	0b RW/1C	**BOOT_TER_INT (boot_ter_int):** boot ter int
13	0b RW/1C	**BOOT_ACK_RCV (boot_ck_rcv):** boot ack rcv
12	0b RO	**Re-Tuning Event (re_tune):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. • 1 Re-Tuning should be performed • 0 Re-Tuning is not required
11	0b RO	**INT_C (int_c):** This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_C is detected • 0 = No interrupt is detected
10	0b RO	**INT_B (int_b):** This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_B is detected • 0 = No interrupt is detected
9	0b RO	**INT_A (int_a):** This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_A is detected • 0 = No interrupt is detected

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	**Card Interrupt (crd_int):** Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts. • 1 = Generate Card Interrupt • 0 = No Card Interrupt
7	0b RW/1C	**Card Removal (crd_rm):** This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated. • 1 = Card removed • 0 = Card state stable or Debouncing
6	0b RW/1C	**Card Insertion (crd_ins):** This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated. • 1 Card inserted • 0 Card state stable or Debouncing
5	0b RW/1C	**Buffer Read Ready (buf_rd_rdy):** This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution. • 1 = Ready to read buffer • 0 = Not ready to read buffer
4	0b RW/1C	**Buffer Write Ready (buf_wr_rdy):** This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register. • 1 = Ready to write buffer • 0 = Not ready to write buffer
3	0b RW/1C	**DMA Interrupt (dma_int):** This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete. • 1 = DMA Interrupt is generated • 0 = No DMA Interrupt
2	0b RW/1C	**Block Gap Event (blk_gap_event):** If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. **(1) In the case of a Read Transaction** This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p]**(1) In the case of a Write Transaction** This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events. • 1 = Transaction stopped at block gap • 0 = No Block Gap Event

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	**Transfer Complete (tx_comp):** This bit is set when a read / write transfer and a command with busy is completed. **(1) In the case of a Read Transaction** This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. **(2) In the case of a Write Transaction** This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. **(3) In the case of a command with busy** This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error. • 1 = Command execution is completed • 0 = Not complete While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.
0	0b RW/1C	**Command Complete (cmd_comp):** This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec. • 1 = Command complete • 0 = No command complete

16.8.21 Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 32h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
vend_spec_err_status	boot_cmd_timeout_err	ceata_err	tgt_rsp_err	rsvd		adma_err	cmd12_err	cur_limit_err	data_end_bit_err	data_crc_err	data_timeout_err	cmd_index_err	cmd_end_bit_err	cmd_crc_err	cmd_timeout_err

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	**Vendor Specific Error Status (vend_spec_err_status):** Reserved.
14	0b RW	**Boot Command Timeout Error (boot_cmd_timeout_err):** Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	**CEATA Error (ceata_err):** Occurs when ATA command termination has occured due to an error condition the device has encountered.
12	0b RW	**Target Response Error (tgt_rsp_err):** Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	**Reserved (rsvd):** Reserved.
9	0b RW	**ADMA Error (adma_err):** This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. **ADMA Error State** in the ADMA Error Status indicates that an error occurs in ST_FDS state.The Host Driver may find that Valid bit is not set at the error descriptor. • 0 = error • 1 = no error
8	0b RW	**Auto CMD12 Error (cmd12_err):** Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. • 1 = error • 0 = no error
7	0b RW	**Current Limit Error (cur_limit_err):** By setting the **SD Bus Power** bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. • 1 = power fail • 0 = no error
6	0b RW	**Data End Bit Error (data_end_bit_err):** Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. • 1 = error • 0 = no error
5	0b RW	**Data CRC Error (data_crc_err):** Occurs when detecting CRC error when transferring read data which uses the **DAT** line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	**Data Timeout Error (data_timeout_err):** This bit is set when detecting one of following timeout conditions. • Busy timeout for R1b,R5b type • Busy timeout after Write CRC status • Write CRC Status timeout • Read Data timeout • 1 = time out • 0 = no error

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**Command Index Error (cmd_index_err):** This bit is set if a Command Index error occurs in the command response. • 1 = error • 0 = no error
2	0b RW	**Command End Bit Error (cmd_end_bit_err):** This bit is set when detecting that the end bit of a command response is 0. • 1 = End Bit Error generated • 0 = no error
1	0b RW	**Command CRC Error (cmd_crc_err): Command CRC Error** is generated in two cases. If a response is returned and the **Command Timeout Error** is set to 0(indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between **Command CRC Error** and **Command Timeout Error**). • 1 = CRC Error Generated. • 0 = no error
0	0b RW	**Command Timeout Error (cmd_timeout_err):** This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case **Command CRC Error** shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and **Command CRC Error**) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. • 1 = time out • 0 = no Error

16.8.22 Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**Preset Value (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. • 1 = Automatic Selection by Preset Value are Enabled • 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**Asynchronous Interrupt (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this be to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete. • 1 = Enabled • 0 = Disabled

Bit Range	Default & Access	Field Name (ID): Description
29:24	0b RO	**RSVD0:** Reserved
23	0b RW	**Sampling Clock (sampling_clock):** This bit is set by tuning procedure when Execute Tuning is cleared.
22	0b RW/AC	**Execute Tuning (execute_tuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0. Refer to the spec for more detail about tuning procedure. • 1 = Execute Tuning • 0 = Not Tuned or Tuning Completed
21:20	0b RW	**Driver Strength (driver_strength):** Host Controller output driver in 1.8V signaling is selected by this bit.
19	0b RW	**Voltage Regulator Control for I/O Cell (vl):** This bit controls voltage regulator for I/O cell.

16.8.27 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 40h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

capabilities

16.8.31 Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 52h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 0000h

0	0b RW	**Force Event for Command Timeout Error (cmd_timeout_err):** • 1 = Interrupt is generated • 0 No Interrupt

16.8.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST_CADR: This sate is never set because do not generate ADMA error in this state.

- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 54h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:18, F:0] + 10h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**RSVD0:** Reserved
30:24	0h RW	**Back-End Power Control (pwr_ctrl):** Each bit of this field controls back-end power supply for an embedded device. Host interface voltage (VDDH) is not controlled by this field. The number of devices supported is specified by **Number of Clock Pins**, and a maximum of 7 devices can be controlled. • D24 Back-end Power Control for Device 1 • D25 Back-end Power Control for Device 2 • D26 Back-end Power Control for Device 3 • D27 Back-end Power Control for Device 4 • D28 Back-end Power Control for Device 5 • D29 Back-end Power Control for Device 6 • D30 Back-end Power Control for Device 7 The function of each bit is defined as follows: • 0 = Back-end Power is Off • 1 = Back-end Power is Supplied Back-End power control is effective for embedded memory devices in the Sleep State that support the Sleep command (CMD14) to reduce power consumption and embedded SDIO devices when IOEx is set to 0.
23	0b RO	**RSVD1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22:20	0h RW	**Interrupt Pin Select (int_pin):** Interrupt pin inputs are enabled by this field. Enable of unsupported interrupt pin is meaningless. • 000b = Interrupt is detected by theInterrupt Cycle. • xx1b = INT_A is enabled • x1xb = INT_B is enabled • 1xxb = INT_C is enabled
19	0b RO	**RSVD2:** Reserved
18:16	0h RW	**Clock Pin Select (clk_pin):** One of clock pin outputs is selected by this field. Selection of unsupported clock pins is meaningless. Refer to Figure 2-38 for the timing of clock outputs. • 000b = Clock Pins are disabled • 001b = CLK[1] is selected • 010b = CLK[2] is selected • . . . • 111b = CLK[7] is Selected
15	0b RO	**RSVD3:** Reserved
14:8	0h RO	**Bus Width Preset (bus_width):** Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins, and a maximum of 7 devices are supported. This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1. • D24 = Bus width preset for Device 1 • D25 = Bus width preset for Device 2 • D26 = Bus width preset for Device 3 • D27 = Bus width preset for Device 4 • D28 = Bus width preset for Device 5 • D29 = Bus width preset for Device 6 • D30 = Bus width preset for Device 7 The function of each bit is defined as follows: • 0 = 4 bit buswidth mode • 1 = 8 bit buswidth mode
7:6	0b RO	**RSVD4:** Reserved
5:4	0h RO	**Number of Interrupt Pins (num_int_pin):** This field indicates support of interrupt input pins for shared bus system. Three asynchronous interrupt pins are defined, INT_A#, INT_B# and INT_C#. Which interrupt pin is used is determined by the system. Each one is driven by open drain and then wired OR connection is possible. • 00b = Interrupt Input Pin is not supported • 01b = INTA is Supported • 10b = INTA and INTB are supported • 11b = INTA, INTB and INTC are supported
3	0b RO	**RSVD5:** Reserved
2:0	0h RO	**Number of Clock Pins (num_clk_pin):** This field indicates support of clock pins to select one of devices for shared bus system. Up to 7 clock pins can be supported. Shared bus is supported by specific system. Then the Standard Host Driver does not support control of these clock pins. • 000b Shared bus is not supported • 001b 1 SDCLK pin is supported • 010b 2 SDCLK pins are supported • . . . • 111b 7 SDCLK pins are supported

16.8.37 SPI Interrupt Support Register (SPI_INT_SUP)—Offset F0h

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [BAR] + F0h

DEVICEID				VENDORID				

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Device ID (DEVICEID):** Device ID identifies the particular AHB device. This is tied to a strap at the top level.
15:0	0000h RO	**Vendor ID (VENDORID):** Vendor ID is a unique ID provided by PCI SIG which identifies the manufacturer of the device. This is tied to a strap at the top level.

16.9.2 Status and Command Register (STATUSCOMMAND)—Offset 4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 4h

Default: 00100000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Reserved0		RMA	RCA	Reserved1							CAPLIST	INTR_STATUS	Reserved2			Reserved3					INTR_DISABLE	Reserved4	SERR_ENABLE	Reserved5					BME	MSE	Reserved6

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved.
29	0h RW/1C	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, Bridge sets this bit. S/W writes a '1' to this bit to clear it. This bit will not be set for the Fabric port. This bit is not used for the Fabric Port
28	0h RW/1C	**Received Target Abort (RCA):** If the completion status received from IOSF is CA, Bridge sets this bit. S/W writes a 1 to this bit to clear it. This bit will not be set for the fabric port. This bit is not used for the Fabric Port
27:21	00h RO	**Reserved1:** Reserved.
20	1h RO	**Capabilities List (CAPLIST):** Hardwired to 1. Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h. If PM capability is not required then this bit should be tied to 0.
19	0h RO	**Interrupt Status (INTR_STATUS):** This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:16	0h RO	**Reserved2:** Reserved.
15:11	00h RO	**Reserved3:** Reserved.
10	0h RW	**Interrupt Disable (INTR_DISABLE):** Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt; i.e., Bridge does not send Interrupt Assert message through the IOSF SideBand Channel. Reset value of this bit is 0.
9	0h RO	**Reserved4:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SERR# Enable (SERR_ENABLE):** This bit controls the sending of DO_SERR messages on IOSF SB.
7:3	00h RO	**Reserved5:** Reserved.
2	0h RW	**Bus Master Enable (BME):** If this bit is 0, Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0.
1	0h RW	**Memory Space Enable (MSE):** This bit controls Bridges response to downstream memory accesses. When set, accesses to the memory space of the device are enabled. Reset value of this bit is 0.
0	0h RO	**Reserved6:** Reserved.

16.9.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 8h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
											CLASS_CODES																RID				

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Class Code (CLASS_CODES):** This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level.
7:0	00h RO	**Revision ID (RID):** Identifies the revision of a particular AHB device. This is tied to a strap at the top level.

16.9.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Bits 31:24	Bit 23	Bits 22:16	Bits 15:8	Bits 7:0
Reserved0	MULFNDEV	HEADERTYPE	LATTIMER	CACHELINE_SIZE

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**Multifunction Device (MULFNDEV):** This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device.
22:16	00h RO	**Header Type (HEADERTYPE):** Implements Type 0 Configuration header.
15:8	00h RO	**Latency Timer (LATTIMER):** Doesnt apply to PCI Express. Hardwired to 00h.
7:0	00h RW	**Cache Line Size (CACHELINE_SIZE):** Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.

16.9.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:23, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Bits 31:12	Bits 11:4	Bit 3	Bits 2:1	Bit 0
BASEADDR	SIZEINDICATOR	PREFETCHABLE	TYPE	MESSAGE_SPACE

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address (BASEADDR):** Base address of the AHB device memory space. Taken from Strap values as 1s.

Bit Range	Default & Access	Field Name (ID): Description
11:4	00h RO	**Size Indicator (Read Only) (SIZEINDICATOR):** Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s.
3	0h RO	**Prefetchable (PREFETCHABLE):** Indicates that this bar is not prefetchable.
2:1	0h RO	**Type (TYPE):** '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** 0 Indicates that this BAR is present in the memory space.

16.9.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 14h

Default: 00000000h

Bits	31:12	11:4	3	2:1	0
Default	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0	0 0	0
Field	BASEADDR1	SIZEINDICATOR1	PREFETCHABLE1	TYPE1	MESSAGE_SPACE1

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**Base Address Register1 (BASEADDR1):** This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0.
11:4	00h RO	**Size Indicator1 (SIZEINDICATOR1):** Always will be zero as minimum size is 4K.
3	0h RO	**Prefetchable (PREFETCHABLE1):** Indicates that this bar is not prefetchable.
2:1	0h RO	**Type (TYPE1):** '00' indicates that the BAR lies in 32 bit address range.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** 0 Indicates that this BAR is present in the memory space.

16.9.7 Subsystem Vendor ID and Subsystem ID Register (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 2Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SUBSYSTEMID																SUBSYSTEMVENDORID															

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**Subsystem ID (SUBSYSTEMID):** This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register.
15:0	0000h RW/O	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.

16.9.8 Expansion ROM Base Address Register (EXPANSION_ROM_BASEADDR)—Offset 30h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 30h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
EXPANSION_ROM_BASE																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Expansion ROM Base Address (EXPANSION_ROM_BASE):** Value of all 0s indicates no support for Expansion ROM.

16.9.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 34h

Default: 00000080h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
Reserved0																								CAPPTR_POWER							

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved0:** Reserved.
7:0	80h RO	**Capabilities Pointer (CAPPTR_POWER):** Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h.

16.9.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + 3Ch

Default: 00000100h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
MAX_LAT								MIN_GNT								Reserved0				INTPIN				INTLINE							

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Max_Lat (MAX_LAT):** Value of 0 indicates that the device has no major requirements for the settings of latency timers.
23:16	00h RO	**Min_Gnt (MIN_GNT):** Value of 0 indicates that the device has no major requirements for the settings of latency timers.
15:12	0h RO	**Reserved0:** Reserved.
11:8	1h RO	**Interrupt Pin (INTPIN):** Each AHB IP on Bridge is a single function device. Hence Bridge only generates INTA on IOSF SB. The Fabric on AHB Bridge appears as a Multifunction device. Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW	**Interrupt Line (INTLINE):** Bridge does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

16.9.11 Power Management Capability ID Register (POWERCAPID)—Offset 80h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 80h

Default: 48030001h

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
0 1 0 0	1 0 0 0	0 0 0 0	0 0 1 1	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1

Fields: PMESUPPORT, Reserved0, VERSION, NXTCAP, POWER_CAP

Bit Range	Default & Access	Field Name (ID): Description
31:27	09h RO	**PME_Support (PMESUPPORT):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1. Bridge does not support this state. bit(13) X X1XXb - PME# can be asserted from D2. Bridge does not support this state. bit(14) X 1XXXb - PME# can be asserted from D3hot. bit(15) 1 XXXXb - PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap.
26:19	00h RO	**Reserved0:** Reserved.
18:16	3h RO	**Version (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	00h RO	**Next Capability (NXTCAP):** Points to the next capability structure. This points to NULL.
7:0	01h RO	**Power Management Capability (POWER_CAP):** Indicates this is power management capability.

16.9.12 Power Management Control and Status Register (PMECTRLSTATUS)—Offset 84h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + 84h

Default: 00000008h

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 0 0 0

Fields: Reserved0, PMESTATUS, Reserved1, PMEENABLE, Reserved2, NO_SOFT_RESET, Reserved3, POWERSTATE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved0:** Reserved.
15	0h RW/1C	**PME Status (PMESTATUS):** 0 = Software clears the bit by writing a 1 to it. 1 = This bit is set when the AHB Device would normally assert the PME# signal independent of the state of the PME Enable bit in this register.
14:9	00h RO	**Reserved1:** Reserved.
8	0h RW	**PME Enable (PMEENABLE):** A 1 enables the function to assert PME#. When 0, PME# message on SB is disabled.
7:4	0h RO	**Reserved2:** Reserved.
3	1h RO	**No Soft Reset (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	**Reserved3:** Reserved.
1:0	0h RW	**Power State (POWERSTATE):** This field is used both to determine the current power state of the AHB IP and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked. D3Hot will not be used for upstream decode on fabric ports.

16.9.13 General Purpose Read Write Register1 (GEN_REGRW1)—Offset A0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:23, F:0] + A0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GEN_REG_RW1

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** capabilities over-ride for the sd/sdio/emmc host controler (bits 31:0)

16.9.14 General Purpose Read Write Register2 (GEN_REGRW2)—Offset A4h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + A4h

Default: 00000000h

31	30:0
0	000 0000 0000 0000 0000 0000 0000 0000
CAP_REG_SEL	GEN_REG_RW2

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CAP_REG_SEL:** select if the capabilty will come from the GEN PCI register or from a hard wire
30:0	0h RW	**GEN_REG_RW2:** capabilities over-ride for the sd/sdio/emmc host controler (bits 62:32)

16.9.15 General Purpose Read Write Register3 (GEN_REGRW3)—Offset A8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + A8h

Default: 00000000h

31:0
0000 0000 0000 0000 0000 0000 0000 0000
GEN_REG_RW3

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** Reserved.

16.9.16 General Purpose Read Write Register4 (GEN_REGRW4)—Offset ACh

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:23, F:0] + ACh

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GEN_REG_RW4

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** Reserved.

16.9.17 General Purpose Input Register (GEN_INPUT_REGRW)—Offset C0h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:23, F:0] + C0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GEN_REG_INPUT_RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** Reserved.

16.9.18 Manufacturers ID Register (MANID)—Offset F8h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:23, F:0] + F8h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MANID

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**Manufacturer ID (MANID):** This register is brought out as straps to the top level.

16.10 eMMC 4.5 Memory Mapped IO Registers

Table 189. Summary of eMMC 4.5 Memory Mapped I/O Registers—BAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–3h	4	"SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h" on page 1884	00000000h
4–5h	2	"Block Size Register (BLK_SIZE)—Offset 4h" on page 1885	0000h

E0–E3h	4	"Shared Bus Control Register (SHARED_BUS)—Offset E0h" on page 1923	00000000h
F0–F0h	1	"SPI Interrupt Support Register (SPI_INT_SUP)—Offset F0h" on page 1925	00h
FC–FDh	2	"Slot Interrupt Status Register (SLOT_INT_STAT)—Offset FCh" on page 1925	0000h
FE–FFh	2	"Host Controller Version Register (HOST_CTRL_VER)—Offset FEh" on page 1926	B502h

16.10.1 SDMA System Address / Argument 2 Register (SYS_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

sys_adr

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SDMA System Address (sys_adr): (1) SDMA System Address** This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. **(2) Argument 2** This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.

16.10.2 Block Size Register (BLK_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
tx_blk_size_12	boundary			tr_blk_size											

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	**TX_BLK_SIZE_12 (tx_blk_size_12):** Transfer Block Size 12th bit. This bit is added to support 4Kb Data block transfer.

Bit Range	Default & Access	Field Name (ID): Description
14:12	000b RW	**Host SDMA Buffer Boundary (boundary):** The large contiguous memory space may not be available in the virtual memory system. To perform long SDMA transfer, SDMA System Address register shall be updated at every system memory boundary during SDMA transfer. These bits specify the size of contiguous buffer in the system memory. The SDMA transfer shall wait at each boundary specified by these fields and the Host Controller generates the DMA Interrupt to request the Host Driver to update the SDMA System Address register. At the end of transfer, the Host Controller may issue or may not issue DMA Interrupt. In particular, DMA Interrupt shall not be issued after Transfer Complete Interrupt is issued. In case of this register is set to 0 (buffer size = 4K bytes), lower 12-bit of byte address points data in the contiguous buffer and the upper 20-bit points the location of the buffer in the system memory. The SDMA transfer stops when the Host Controller detects carry out of the address from bit 11 to 12. These bits shall be supported when the SDMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. ADMA does not use this register. • 000b = 4K bytes (Detects A11 carry out) • 001b = 8K bytes (Detects A12 carry out) • 010b = 16K Bytes (Detects A13 carry out) • 011b = 32K Bytes (Detects A14 carry out) • 100b = 64K bytes (Detects A15 carry out) • 101b = 128K Bytes (Detects A16 carry out) • 110b = 256K Bytes (Detects A17 carry out) • 111b = 512K Bytes (Detects A18 carry out)
11:0	000h RW	**Transfer Block Size (tr_blk_size):** This register specifies the block size of data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. Values ranging from 1 up to the maximum buffer size can be set. In case of memory, it shall be set up to 512 bytes (Refer to Implementation Note in Section 1.7.2 *Determining Buffer Block Length*). It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations shall be ignored. • 0800h = 2048 Bytes • . . . • 0200h = 512 Bytes • 01FFh = 511 Bytes • . . . • 0004h = 4 Bytes • 0003h = 3 Bytes • 0002h = 2 Bytes • 0001h = 1 Byte • 0000h = No data transfer

16.10.3 Block Count Register (BLK_COUNT)—Offset 6h

This register is used to configure the number of data blocks.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 6h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
blk_count															

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**Blocks Count For Current Transfer (blk_count):** This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count. • 0000h = Stop Count • 0001h = 1 block • 0002h = 2 blocks • . . . • FFFFh = 65535 blocks

16.10.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

argument

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Argument 1 (argument):** The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification.

16.10.5 Transfer Mode Register (TX_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
rsvd							boot_en	spi_mode	cmd_comp_ata	blk_sel	data_tr_dir	auto_cmd_en		blk_count_en	dma_en

Bit Range	Default & Access	Field Name (ID): Description
15:9	00h RO	**Reserved (rsvd):** Reserved.
8	0b RW	**BOOT_EN (boot_en):** To start boot operation for MMC4.3 1 - To start boot mode 0 - Stop the boot read
7	0b RW	**SPI_MODE (spi_mode):** SPI mode enable bit. 1 - SPI mode 0 - SD mode
6	0b RW	**CMD_COMP_ATA (cmd_comp_ata):** Command Completion Signal Enable for CE-ATA Device. ???1??? - Device will send command completion Signal ???0??? - Device will not send command completion Signal
5	0b RW	**BLK_SEL (blk_sel):** Multi / Single Block Select This bit is set when issuing multiple-block transfer commands using DAT line. For any other commands, this bit shall be set to 0. If this bit is 0, it is not necessary to set the Block Count register. (Refer to Table 2-8) 1 Multiple Block 0 Single Block
4	0b RW	**Data Transfer Direction Select (data_tr_dir):** This bit defines the direction of DAT line data transfers. The bit is set to 1 by the Host Driver to transfer data from the SD card to the SD Host Controller, and it is set to 0 for all other commands. • 1 = Read (Card to Host) • 0 = Write (Host to Card)
3:2	0b RW	**AUTO_CMD_EN (auto_cmd_en):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable 11b - Reserved
1	0b RW	**Block Count Enable (blk_count_en):** This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. • 1 = Enable • 0 = Disable
0	0b RW	**DMA Enable (dma_en):** This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). • 1 = DMA Data transfer • 0 = No data transfer or Non DMA data transfer

16.10.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

Offset: [BAR] + Eh

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
rsvd		cmd_index						cmd_type		data_pr_sel	cmd_index_chk_en	cmd_crc_chk_en	reserved	resp_type_sel	

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Rsvd (rsvd):** Reserved.
13:8	0h RW	**Command Index (cmd_index):** These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.
7:6	00b RW	**Command Type (cmd_type):** There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. **(1) Suspend Command** If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). **(2) Resume Command** The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. **(3) Abort Command** If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). • 11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR • 10b = Resume -- CMD52 for writing 'Function Select' in CCCR • 01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR • 00b = Normal -- Other commands
5	0b RW	**Data Present Select (data_pr_sel):** This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. • 1 = Data Present • 0 = No Data Present

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**Command Index Check Enable (cmd_index_chk_en):** If this bit is set to 1, the Host Controller shall check the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this bit is set to 0, the Index field is not checked. • 1 = Enable • 0 = Disable
3	0b RW	**Command CRC Check Enable (cmd_crc_chk_en):** If this bit is set to 1, the Host Controller shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. The position of CRC field is determined according to the length of the response. (Refer to definition in D01-00 and Table 2-10 below.) • 1 = Enable • 0 = Disable
2	0b RO	**Reserved (reserved):** Reserved.
1:0	0h RW	**Response Type Select (resp_type_sel):** • 00 = No Response • 01 = Response Length 136 • 10 = Response Length 48 • 11 = Response Length 48 check Busy after response

16.10.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (reserved2):** Reserved.
28:25	1111b RO	**DAT Line Signal Level (dat_sig_lvl):** This status is used to check DAT line level to recover from errors, and for debugging. • D28 - DAT[7] • D27 - DAT[6] • D26 - DAT[5] • D25 - DAT[4]
24	1b RO	**CMD Line Signal Level (cmd_ln_sig_lvl):** This status is used to check the CMD line level to recover from errors, and for debugging.
23:20	Fh RO	**DAT[3:0] Line Signal Level (data_ln_sig_lvl):** This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. • D23 = DAT[3] • D22 = DAT[2] • D21 = DAT[1] • D20 = DAT[0]
19	1b RO	**Write Protect Switch Pin Level (wr_prot_sw_pin_lvl):** The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP# pin. • 1 = Write enabled (SDWP#=1) • 0 = Write protected (SDWP#=0)
18	1b RO	**Card Detect Pin Level (crd_det_pin_lvl):** This bit reflects the inverse value of the SDCD# pin. Debouncing is not performed on this bit. This bit may be valid when Card State Stable is set to 1, but it is not guaranteed because of propagation delay. Use of this bit is limited to testing since it must be debounced by software. • 1 = Card present (SDCD#=0) • 0 = No card present (SDCD#=1)
17	1b RO	**Card State Stable (crd_st_stable):** This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. No Card state can be detected by this bit being set to 1 while Card Inserted is set to 0. The Software Reset For All in the Software Reset register shall not affect this bit. • 1 = No Card or Inserted • 0 = Reset or Debouncing

Bit Range	Default & Access	Field Name (ID): Description
16	1b RO	**Card Inserted (crd_ins):** This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power. • 1 = Card Inserted • 0 = Reset or Debouncing or No Card
15:12	0h RO	**Reserved1 (reserved1):** Reserved.
11	0b RO	**Buffer Read Enable (buf_rd_en):** This status is used for non-DMA read transfers. The Host Controller may implement multiple buffers to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when block data is ready in the buffer and generates the Buffer Read Ready interrupt. • 1 = Read enable • 0 = Read disable
10	0b RO	**Buffer Write Enable (buf_wr_en):** This status is used for non-DMA write transfers. The Host Controller can implement multiple buffers to transfer data efficiently. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer. A change of this bit from 0 to 1 occurs when top of block data can be written to the buffer and generates the Buffer Write Ready interrupt. The Host Controller should neither set Buffer Write Enable nor generate Buffer Write Ready Interrupt after the last block data is written to the Buffer Data Port Register. • 1 = Write enable • 0 = Write disable
9	0b RO	**Read Transfer Active (rd_tx_active):** This status is used for detecting completion of a read transfer. Refer to Section 3.12.3 for sequence details. This bit is set to 1 for either of the following conditions: • After the end bit of the read command. • When read operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared to 0 for either of the following conditions: • When the last data block as specified by block length is transferred to the System. • In case of ADMA2, end of read operation is designated by Descriptor Table. • When all valid data blocks in the Host Controller have been transferred to the System and no current block transfers are being sent as a result of the Stop At Block Gap Request being set to 1. A Transfer Complete interrupt is generated when this bit changes to 0. • 1 = Transferring data • 0 = No valid data

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	**Write Transfer Active (wr_tx_active):** This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the Host Controller. Refer to Section 3.12.4 for more details on the sequence of events. This bit is set in either of the following cases: • After the end bit of the write command. • When write operation is restarted by writing a 1 to Continue Request in the Block Gap Control register. This bit is cleared in either of the following cases: • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) In case of ADMA2, transfer count is designated by Descriptor Table. • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as the result of the Stop At Block Gap Request being set. This status is useful for the Host Driver in determining non DAT line commands can be issued during write busy. • 1 Transferring data • 0 No valid data
7:3	00h RO	**Reserved (reserved):** Reserved.
2	0b RO	**DAT Line Active (dat_ln_active):** This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases: • After the end bit of the read command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer. This bit shall be cleared in either of the following cases: • When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request. The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases: • After the end bit of the write command. • When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer. This bit shall be cleared in either of the following cases: • When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table. • When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request. (c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13. • 1 = DAT Line Active • 0 = DAT Line Inactive

Bit Range	Default & Access	Field Name (ID): Description
1	0b RO	**Command Inhibit (DAT) (cmd_inhibit_dat):** This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. **Note:** The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. • 1 Cannot issue command which uses the DAT line • 0 Can issue command which uses the DAT line
0	0b RO	**Command Inhibit (CMD) (cmd_inhibit_cmd):** Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set. • 1 Cannot issue command • 0 Can issue command using only CMD line

16.10.13 Host Control 1 Register (HOST_CTL)—Offset 28h

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
crd_det_sig_sel	crd_det_tst_lvl	sd8_bit_mode	dma_sel		hi_spd_en	data_tx_wid	led_ctl

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**Card Detect Signal Selection (crd_det_sig_sel):** This bit selects source for the card detection. • 1 = The Card Detect Test Level is selected (for test purposes) • 0 = SDCD# is selected (for normal use) When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/ Signal Enable should be disabled during the period of debouncing.

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	**Card Detect Test Level (crd_det_tst_lvl):** This bit is enabled while the Card Detect Signal Selection is set to 1, and it indicates whether or not the card is inserted. • 1 = Card Inserted • 0 = No Card
5	0b RW	**SD8 Bit Mode (sd8_bit_mode):** This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card.
4:3	00b RW	**DMA Select (dma_sel):** One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. • 00 = SDMA is selected • 01 = Reserved (New assignment is not allowed) • 10 = 32-bit Address ADMA2 is selected • 11 = Reserved (will be modified by Version 4.00)
2	0b RW	**High Speed Enable (hi_spd_en):** This bit is optional. Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 (default), the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock (up to 25MHz). If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock (up to 50MHz). If Preset Value Enable in the Host Control 2 register is set to 1, Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitches. After setting this field, the Host Driver sets SD Clock Enable again. • 1 = 4-bit mode • 0 = 1-bit mode
1	0b RW	**Data Transfer Width (data_tx_wid):** Reserved.
0	0b RW	**LED Control (led_ctl):** This bit selects the data width of the Host Controller. The Host Driver shall set it to match the data width of the SD card. • 1 = 4-bit mode • 0 = 1-bit mode

16.10.14 Power Control Register (PWR_CTL)—Offset 29h

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 29h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd			hw_rst	sd_bus_volt_sel			sd_bus_pwr

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Rsvd (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**HW Reset (hw_rst):** Reserved.
3:1	0h RW	**SD Bus Voltage Select (sd_bus_volt_sel):** By setting these bits, the Host Driver selects the voltage level for the SD card. Before setting this register, the Host Driver shall check the Voltage Support bits in the Capabilities register. If an unsupported voltage is selected, the Host System shall not supply SD Bus voltage. • 111b = 3.3V (Typ.) • 110b = 3.0V (Typ.) • 101b = 1.8V (Typ.) • 100b 000b Reserved
0	0b RW	**SD Bus Power (sd_bus_pwr):** Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. • 1 = Power on • 0 = Power off

16.10.15 Block Gap Control Register (_BLK_GAP_CTL)—Offset 2Ah

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 2Ah

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
rsvd			drive_ccsd	int_blk_gap	rd_wait_ctl	cont_req	stp_blk_gap_req

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (rsvd):** Reserved.
4	0b RW	**DRIVE_CCSD (drive_ccsd):** If the driver set this bit (change from ???0??? to ???1???), Host controller will send command completion.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**Interrupt at Block Gap (int_blk_gap):** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. • 1 = Enabled • 0 = Disabled
2	0b RW	**Read Wait Control (rd_wait_ctl):** The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. • 1 = Enable Read Wait Control • 0 = Disable Read Wait Control
1	0b RW	**Continue Request (cont_req):** This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: • In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. • In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts. Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. • 1 = Restart • 0 = Not affect
0	0b RW	**Stop at Block Gap Request (stp_blk_gap_req):** This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12. • 1 = Stop • 0 = Transfer

16.10.16 Wakeup Control Register (WAKEUP_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

Access Method

sdclk_freq_sel								upper_sdclk_freq_sel		rsvd			sd_clk_en	int_clk_stable	int_clk_en

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW	**SDCLK Frequency Select (sdclk_freq_sel):** This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. **(1) 8-bit Divided Clock Mode** This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. **(1) 8-bit Divided Clock Mode** • 80h = base clock divided by 256 • 40h = base clock divided by 128 • 20h = base clock divided by 64 • 10h = base clock divided by 32 • 08h = base clock divided by 16 • 04h = base clock divided by 8 • 02h = base clock divided by 4 • 01h = base clock divided by 2 • 00h = base clock(10MHz and up) Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register. • 400KHz divider value • 25MHz divider value • 50MHz divider value According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz. **(2) 10-bit Divided Clock Mode** Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported. • 3FFh = 1/2046 Divided Clock • N = 1/2N Divided Clock (Duty 50%) • 002h = 1/4 Divided Clock • 001h = 1/2 Divided Clock • 000h = Base Clock (10MHz and up) • 3FFh = Base Clock * M / 1024 • .... • N - 1 = Base Clock * M / N • .... • 002h = Base Clock * M / 3 • 001h = Base Clock * M / 2 • 000h = Base Clock * M This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Upper Bits of SDCLK Frequency Select (upper_sdclk_freq_sel):** Host Controller Versions 1.00 and 2.00 do not support these bits and they are treated as 00b fixed value (ROC). Host Controller Version 3.00 shall support these bits to expand SDCLK Frequency Select to 10-bit. Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5:3	0h RO	**Rsvd (rsvd):** Reserved.
2	0b RW	**SD Clock Enable (sd_clk_en):** The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared. • 1 = Enable • 0 = Disable
1	0b RO	**Internal Clock Stable (int_clk_stable):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. **Note:** This is useful when using PLL for a clock oscillator that requires setup time. • 1 = Ready • 0 = Not Ready
0	0b RW	**Internal Clock Enable (int_clk_en):** This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection. • 1 = Oscillate • 0 = Stop

16.10.18 Timeout Control Register (TIMEOUT_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [BAR] + 2Eh

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**Software Reset For DAT Line (sw_rst_dat_ln):** Only part of data circuit is reset. DMA circuit is also reset. The following registers and bits are cleared by this bit: Buffer Data Port register • Buffer is cleared and initialized. Present State register • Buffer Read Enable • Buffer Write Enable • Read Transfer Active • Write Transfer Active • DAT Line Active • Command Inhibit (DAT) Block Gap Control register • Continue Request • Stop At Block Gap Request Normal Interrupt Status register • Buffer Read Ready • Buffer Write Ready • DMA Interrupt • Block Gap Event • Transfer Complete • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.
1	0b RW	**Software Reset For CMD Line (sw_rst_cmd_ln):** Only part of command circuit is reset. The following registers and bits are cleared by this bit: Present State register • Command Inhibit (CMD) Normal Interrupt Status register • Command Complete • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.
0	0b RW	**Software Reset For All (sw_rst_all):** This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card. • 1 = Reset • 0 = Work When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.

16.10.20 Normal Interrupt Status Register (NML_INT_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 30h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	**Error Interrupt (err_int):** If any of the bits in the Error Interrupt Status register are set, then this bit is set. Therefore the Host Driver can efficiently test for an error by checking this bit first. This bit is read only. • 1 = Error • 0 = No Error
14	0b RW/1C	**BOOT_TER_INT (boot_ter_int):** boot ter int
13	0b RW/1C	**BOOT_ACK_RCV (boot_ck_rcv):** boot ack rcv
12	0b RO	**Re-Tuning Event (re_tune):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. • 1 Re-Tuning should be performed • 0 Re-Tuning is not required
11	0b RO	**INT_C (int_c):** This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_C is detected • 0 = No interrupt is detected
10	0b RO	**INT_B (int_b):** This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_B is detected • 0 = No interrupt is detected
9	0b RO	**INT_A (int_a):** This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor. Refer to the Shared Bus Control register. • 1 = INT_A is detected • 0 = No interrupt is detected

Bit Range	Default & Access	Field Name (ID): Description
8	0b RO	**Card Interrupt (crd_int):** Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts. • 1 = Generate Card Interrupt • 0 = No Card Interrupt
7	0b RW/1C	**Card Removal (crd_rm):** This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated. • 1 = Card removed • 0 = Card state stable or Debouncing
6	0b RW/1C	**Card Insertion (crd_ins):** This status is set if the Card Inserted in the Present State register changes from 0 to 1. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed, because the card detect state may possibly be changed when the Host Driver clears this bit and interrupt event may not be generated. • 1 Card inserted • 0 Card state stable or Debouncing
5	0b RW/1C	**Buffer Read Ready (buf_rd_rdy):** This status is set if the Buffer Read Enable changes from 0 to 1. Refer to the Buffer Read Enable in the Present State register. While performing tuning procedure (Execute Tuning is set to 1), Buffer Read Ready is set to 1 for every CMD19 execution. • 1 = Ready to read buffer • 0 = Not ready to read buffer
4	0b RW/1C	**Buffer Write Ready (buf_wr_rdy):** This status is set if the Buffer Write Enable changes from 0 to 1. Refer to the Buffer Write Enable in the Present State register. • 1 = Ready to write buffer • 0 = Not ready to write buffer
3	0b RW/1C	**DMA Interrupt (dma_int):** This status is set if the Host Controller detects the Host SDMA Buffer boundary during transfer. Refer to the Host SDMA Buffer Boundary in the Block Size register. Other DMA interrupt factors may be added in the future. In case of ADMA, by setting Int field in the descriptor table, Host Controller generates this interrupt. Suppose that it is used for debugging. This interrupt shall not be generated after the Transfer Complete. • 1 = DMA Interrupt is generated • 0 = No DMA Interrupt
2	0b RW/1C	**Block Gap Event (blk_gap_event):** If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. **(1) In the case of a Read Transaction** This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p]**(1) In the case of a Write Transaction** This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events. • 1 = Transaction stopped at block gap • 0 = No Block Gap Event

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	**Transfer Complete (tx_comp):** This bit is set when a read / write transfer and a command with busy is completed. **(1) In the case of a Read Transaction** This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. **(2) In the case of a Write Transaction** This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. **(3) In the case of a command with busy** This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error. • 1 = Command execution is completed • 0 = Not complete While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.
0	0b RW/1C	**Command Complete (cmd_comp):** This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec. • 1 = Command complete • 0 = No command complete

16.10.21 Error Interrupt Status Register (ERR_INT_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [BAR] + 32h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:23, F:0] + 10h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
vend_spec_err_status	boot_cmd_timeout_err	ceata_err	tgt_rsp_err	rsvd		adma_err	cmd12_err	cur_limit_err	data_end_bit_err	data_crc_err	data_timeout_err	cmd_index_err	cmd_end_bit_err	cmd_crc_err	cmd_timeout_err

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW	**Vendor Specific Error Status (vend_spec_err_status):** Reserved.
14	0b RW	**Boot Command Timeout Error (boot_cmd_timeout_err):** Occur if the boot are access command is issued to the agent which has no permission to access the boot area.
13	0b RW	**CEATA Error (ceata_err):** Occurs when ATA command termination has occured due to an error condition the device has encountered.
12	0b RW	**Target Response Error (tgt_rsp_err):** Occurs when detecting ERROR in m_hresp(dma transaction).
11:10	0h RO	**Reserved (rsvd):** Reserved.
9	0b RW	**ADMA Error (adma_err):** This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. **ADMA Error State** in the ADMA Error Status indicates that an error occurs in ST_FDS state.The Host Driver may find that Valid bit is not set at the error descriptor. • 0 = error • 1 = no error
8	0b RW	**Auto CMD12 Error (cmd12_err):** Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. • 1 = error • 0 = no error
7	0b RW	**Current Limit Error (cur_limit_err):** By setting the **SD Bus Power** bit in the Power Control register, the Host Controller is requested to supply power for the SD Bus. If the Host Controller supports the Current Limit function, it can be protected from an illegal card by stopping power supply to the card in which case this bit indicates a failure status. Reading 1 means the Host Controller is not supplying power to SD card due to some failure. Reading 0 means that the Host Controller is supplying power and no error has occurred. The Host Controller may require some sampling time to detect the current limit. If the Host Controller does not support this function, this bit shall always be set to 0. • 1 = power fail • 0 = no error
6	0b RW	**Data End Bit Error (data_end_bit_err):** Occurs either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status. • 1 = error • 0 = no error
5	0b RW	**Data CRC Error (data_crc_err):** Occurs when detecting CRC error when transferring read data which uses the **DAT** line or when detecting the Write CRC status having a value of other than 010b.
4	0b RW	**Data Timeout Error (data_timeout_err):** This bit is set when detecting one of following timeout conditions. • Busy timeout for R1b,R5b type • Busy timeout after Write CRC status • Write CRC Status timeout • Read Data timeout • 1 = time out • 0 = no error

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**Command Index Error (cmd_index_err):** This bit is set if a Command Index error occurs in the command response. • 1 = error • 0 = no error
2	0b RW	**Command End Bit Error (cmd_end_bit_err):** This bit is set when detecting that the end bit of a command response is 0. • 1 = End Bit Error generated • 0 = no error
1	0b RW	**Command CRC Error (cmd_crc_err): Command CRC Error** is generated in two cases. If a response is returned and the **Command Timeout Error** is set to 0(indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between **Command CRC Error** and **Command Timeout Error**). • 1 = CRC Error Generated. • 0 = no error
0	0b RW	**Command Timeout Error (cmd_timeout_err):** This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case **Command CRC Error** shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and **Command CRC Error**) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller. • 1 = time out • 0 = no Error

16.10.22 Normal Interrupt Status Enable (NRM_INT_STATUS_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

Access Method

3	0	cmd12_end_bit_err
2	0	cmd12_crc_err
1	0	cmd12_timeout_err
0	0	cmd12_not_exe

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**Preset Value (preset_value):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers. • 1 = Automatic Selection by Preset Value are Enabled • 0 SDCLK and Driver Strength are controlled by Host Driver If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.
30	0b RW	**Asynchronous Interrupt (async_int):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this be to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete. • 1 = Enabled • 0 = Disabled

Bit Range	Default & Access	Field Name (ID): Description
29:24	0b RO	**RSVD0:** Reserved
23	0b RW	**Sampling Clock (sampling_clock):** This bit is set by tuning procedure when Execute Tuning is cleared.
22	0b RW/AC	**Execute Tuning (execute_tuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0. Refer to the spec for more detail about tuning procedure. • 1 = Execute Tuning • 0 = Not Tuned or Tuning Completed
21:20	0b RW	**Driver Strength (driver_strength):** Host Controller output driver in 1.8V signaling is selected by this bit.
19	0b RW	**Voltage Regulator Control for I/O Cell (vl):** This bit controls voltage regulator for I/O cell.
18:16	0b RW	**UHS Mode Select (uhs_mode):** This field is used to select one of UHS-I modes.

16.10.31 Force Event Register for Error Interrupt Status (FORCE_EVENT_ERR_INT_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

Access Method

16.10.32 ADMA Error Status Register (ADMA_ERR_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST_CADR: This sate is never set because do not generate ADMA error in this state.

- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Access Method

7:0	02h RO	**Specification Version Number (spec_ver_num):** This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version. • 00h = SD Host Specification Version 1.00 • 01h = SD Host Specification Version 2.00, Including the feature of the ADMA and Test Register • 02h = SD Host Specification Version 3.00 • others = Reserved

17 Serial ATA (SATA)

The SoC has one integrated SATA host controller that supports independent DMA operation on up to 2 ports and supports data transfer rates of 1.5 Gb/s (150 MB/s) and 3.0 Gb/s (300 MB/s). The SATA controller contains two modes of operation—a legacy mode using I/O space, and an AHCI mode using memory space. Software that uses legacy mode will not have AHCI capabilities.

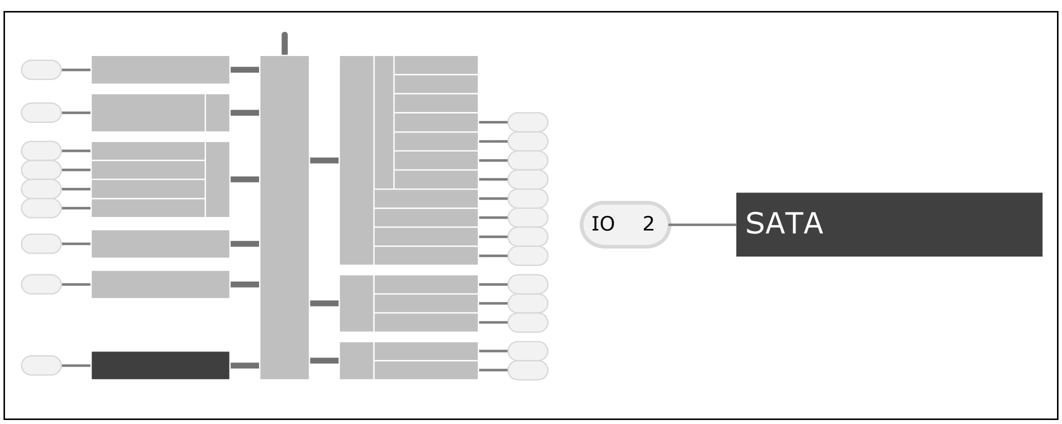
The SoC supports the Serial ATA Specification, Revision 2.6. The SoC also supports several optional sections of the SATA Revision 2.0 Specifications: Extensions to Serial ATA 1.0 Specification, Revision 1.0 (AHCI support is required for some elements).

The SATA controllers feature two sets of interface signals (ports) that can be independently enabled or disabled (they cannot be tri-stated or driven low). Each interface is supported by an independent DMA controller.

The SATA controllers interact with an attached mass storage device through a register interface that is equivalent to that presented by a traditional IDE host adapter. The host software follows existing standards and conventions when accessing the register interface and follows standard command protocol conventions.

Note 1. SATA DevSlp (**Device Sleep**) is not part of revision 2.6 of the SATA specification, with which this processor is compliant. As such, any DEVSLP functionality of this processor is not specification compliant and should not be used.

Note 2. SATA interface transfer rates are independent of UDMA mode settings. SATA interface transfer rates will operate at the bus's maximum speed, regardless of the UDMA mode reported by the SATA device or the system BIOS.



17.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 190. Signals

Signal Name	Direction Plat. Power	Description
SATA_GP[0]	I V1P8S	**Serial ATA 0 General Purpose:** This is an input pin which can be configured as an interlock switch or as a general purpose I/O, depending on the platform. When used as an interlock switch status indication, this signal should be driven to '0' to indicate that the switch is closed, and to '1' to indicate that the switch is open.
SATA_GP[1]	I V1P8S	**Serial ATA 1 General Purpose:** Same as above.
SATA_LED#	O V1P8S	**Serial ATA LED:** This is an open-collector output pin driven during SATA command activity. It is to be connected to external circuitry that can provide the current to drive a platform LED. When active, the LED is on. When tristated, the LED is off.
SATA_TXP[1:0] SATA_TXN[1:0]	O VPCIESATA	**Serial ATA Port 1 and 0:** These are outbound high-speed differential signals to Port 1 and 0.
SATA_RXP[1:0] SATA_RXN[1:0]	I VPCIESATA	**Serial ATA Port 1 and 0:** These are inbound high-speed differential signals to Port 1 and 0.
SATA_RCOMP_P SATA_RCOMP_N	O	These pins are used to connect the external resistors used for Rcomp. Please contact your Intel representative for details.

17.2 Features

17.2.1 Supported Features

Table 191. SATA Feature List (Sheet 1 of 2)

Feature	Description
Native Command Queuing (NCQ)	Allows the device to reorder commands for more efficient data transfers
Auto Activate for DMA	Collapses a DMA Setup then DMA Activate sequence into a DMA Setup only
Hot Plug Support	Allows for device detection without power being applied and ability to connect and disconnect devices without prior notification to the system
Asynchronous Signal Recovery	Provides a recovery from a loss of signal or establishing communication after hot plug
3 Gb/s Transfer Rate	Capable of data transfers up to 3 Gb/s
ATAPI Asynchronous Notification	A mechanism for a device to send a notification to the host that the device requires attention

Table 191. SATA Feature List (Sheet 2 of 2)

Feature	Description
Host & Link Initiated Power Management	Capability for the host controller or device to request Partial and Slumber interface power states
Staggered Spin-Up	Enables the host to spin up hard drives sequentially to prevent power load problems on boot
Command Completion Coalescing	Reduces interrupt and completion overhead by allowing a specified number of commands to complete and then generating an interrupt to process the commands

Table 192. SATA/AHCI Feature Matrix

Feature	AHCI Disabled	AHCI Enabled
Native Command Queuing (NCQ)	N/A	Supported
Auto Activate for DMA	N/A	Supported
Hot Plug Support	N/A	Supported
Asynchronous Signal Recovery	N/A	Supported
3 Gb/s Transfer Rate	Supported	Supported
ATAPI Asynchronous Notification	N/A	Supported
Host & Link Initiated Power Management	N/A	Supported
Staggered Spin-Up	Supported	Supported
Command Completion Coalescing	N/A	N/A

17.2.2 Theory of Operation

17.2.2.1 Standard ATA Emulation

The SoC contains a set of registers that shadow the contents of the legacy IDE registers. The behavior of the Command and Control Block registers, PIO, and DMA data transfers, resets, and interrupts are all emulated.

Note: The SoC will assert INTR when the master device completes the EDD command regardless of the command completion status of the slave device. If the master completes EDD first, an INTR is generated and BSY will remain '1' until the slave completes the command. If the slave completes EDD first, BSY will be '0' when the master completes the EDD command and asserts INTR. Software must wait for busy to clear (0) before completing an EDD command, as required by the ATA5 through ATA7 (T13) industry standards.

17.2.2.2 48-Bit LBA Operation

The SATA host controller supports 48-bit LBA through the host-to-device register FIS when accesses are performed using writes to the task file. The SATA host controller will ensure that the correct data is put into the correct byte of the host-to-device FIS.

There are special considerations when reading from the task file to support 48-bit LBA operation. Software may need to read all 16-bits. Since the registers are only 8-bits wide and act as a FIFO, a bit must be set in the device/control register, which is at offset 3F6h for primary and 376h for secondary (or their native counterparts).

If software clears Bit 7 of the control register before performing a read, the last item written will be returned from the FIFO. If software sets Bit 7 of the control register before performing a read, the first item written will be returned from the FIFO.

17.2.3 AHCI Operation

The SoC provides hardware support for Advanced Host Controller Interface (AHCI), a programming interface for SATA host controllers developed through a joint industry effort. AHCI defines transactions between the SATA controller and software and enables advanced performance and usability with SATA. Platforms supporting AHCI may take advantage of performance features such as no master/slave designation for SATA devices—each device is treated as a master—and hardware assisted native command queuing. AHCI also provides usability enhancements such as Hot-Plug. AHCI requires appropriate software support (such as, an AHCI driver) and for some features, hardware support in the SATA device or additional platform hardware.

The SoC supports all of the mandatory features of the *Serial ATA Advanced Host Controller Interface Specification*, Revision 1.3 and many optional features, such as hardware assisted native command queuing, aggressive power management, LED indicator support, and Hot-Plug through the use of interlock switch support (additional platform hardware and software may be required depending upon the implementation).

Note: For reliable device removal notification while in AHCI operation without the use of interlock switches (surprise removal), interface power management should be disabled for the associated port.

17.5.1 Identifiers (ID)—Offset 0h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **ID:** [B:0, D:19, F:0] + 0h

Default: 0F208086h

31			28				24				20				16				12				8				4				0
0	0	0	0	1	1	1	1	0	0	1	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0
DID																VID															

Bit Range	Default & Access	Description
31:16	0F20h RO	**Device ID (DID):** The specific value is dependent on config bits and fuses. The value is product specific. VLV SATA DID can be within the range of 0F20-0F27 and 0F2E and 0F2F. However, since VLV SATA does not support RAID, DID can be either 0F20 or OF22.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

17.5.2 Command (CMD)—Offset 4h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **CMD:** [B:0, D:19, F:0] + 4h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0					ID	FBE	SEE	WCC	PEE	VGA	MWIE	SCE	BME	MSE	IOSE

Bit Range	Default & Access	Description
15:11	0b RO	**RSVD0:** Reserved
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# is generated if there is an interrupt and MSI is not enabled.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Reserved.
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	**Wait Cycle Enable (WCC):** Reserved.
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0h RO	**VGA Palette Snooping Enable (VGA):** Reserved.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved.
3	0h RO	**Special Cycle Enable (SCE):** Reserved.
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

17.5.3 Device Status (STS)—Offset 6h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

STS: [B:0, D:19, F:0] + 6h

Default: 02B0h

15			12				8				4				0
0	0	0	0	0	0	1	0	1	0	1	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		DPD	FBC	RSVD0	RSV	CL	IS	RSVD1		

Bit Range	Default & Access	Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C	**Signaled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	1h RO	**Fast Back-to-Back Capable (FBC):** Reserved.
6	0b RO	**RSVD0:** Reserved
5	1h RO	**66 MHz Capable (RSV):** Reserved.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0b RO	**RSVD1:** Reserved

17.5.4 Revision ID (RID)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

RID: [B:0, D:19, F:0] + 8h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RID							

Bit Range	Default & Access	Description
7:0	00h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

17.5.5 Programming Interface (PI)—Offset 9h

This register definition depends on the CC.SCC field. When the CC.SCC is 01h(IDE mode), register definition corresponds to 1st table. When CC.SCC is 06h(AHCI mode), register definition follows the 2nd table.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

PI: [B:0, D:19, F:0] + 9h

Default: 8Ah

7			4				0
1	0	0	0	1	0	1	0
BMS	RSVD0			SNC	SNE	PNC	PNE

Bit Range	Default & Access	Description
7	1h RO	**Bus Master Support (BMS):** Indicates the SATA Controller supports bus master operation.
6:4	0b RO	**RSVD0:** Reserved
3	1h RO	**Secondary Mode Native Capable (SNC):** Indicates that the secondary controller supports both legacy and native modes.
2	0h RW	**Secondary Mode Native Enable (SNE):** Determines the mode that the secondary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the PNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.
1	1h RO	**Primary Mode Native Capable (PNC):** Indicates that the primary controller supports both legacy and native modes.
0	0h RW	**Primary Mode Native Enable (PNE):** Determines the mode that the primary channel is operating in. 0 corresponds to 'compatibility', 1 means PCI native. If this bit is set by SW, then the SNE bit must also be set by SW. While in theory these bits can be programmed separately, such a configuration is not supported by today's software and is not supported by this hardware. If this bit is left unchanged before switching, the result is indeterminate.

17.5.6 Class Code (CC)—Offset Ah

Access Method

Type: PCI Configuration Register (Size: 16 bits)

CC: [B:0, D:19, F:0] + Ah

Default: 0106h

15			12				8				4				0
0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0
BCC								SCC							

Bit Range	Default & Access	Description
15:8	01h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	06h RO	**Sub Class Code (SCC):** The value reported in this field is dependent on MAP.SMS and various fuses and configuration bits. The value is product specific. For VLV this field may read 01h (IDE) or 06h (AHCI).

17.5.7 Cache Line Size (CLS)—Offset Ch

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

CLS: [B:0, D:19, F:0] + Ch

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
CLS							

Bit Range	Default & Access	Description
7:0	00h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

17.5.8 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

MLT: [B:0, D:19, F:0] + Dh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MLT							

Bit Range	Default & Access	Description
7:0	00h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

17.5.9 Header Type (HTYPE)—Offset Eh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

HTYPE: [B:0, D:19, F:0] + Eh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MFD	HL						

Bit Range	Default & Access	Description
7	0h RO	**Multi-function Device (MFD):** Indicates this controller is not part of a multi-function device.
6:0	00h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

17.5.10 Primary Command Block Base Address (PCMDBA)—Offset 10h

This 8-byte I/O space is used in Native Mode for the Primary Controller's Command Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCMDBA: [B:0, D:19, F:0] + 10h

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
RSVD0																BAR													RSVD1		RTE

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:3	0h RW	**Base Address (BAR):** Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.11 Primary Control Block Base Address (PCTLBA)—Offset 14h

This 4-byte I/O space is used in Native Mode for the Primary Controller's Control Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCTLBA: [B:0, D:19, F:0] + 14h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1

RSVD0 | BAR | RSVD1 | RTE

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:2	0h RW	**Base Address (BAR):** Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.12 Secondary Command Block Base Address (SCMDBA)—Offset 18h

This 8-byte I/O space is used in Native Mode for the Secondary Controller's Command Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SCMDBA: [B:0, D:19, F:0] + 18h

Default: 00000001h

31	28	24	20	16	12	8	4	0
0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1

RSVD0 | BAR | RSVD1 | RTE

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:3	0h RW	**Base Address (BAR):** Base address of the I/O space (8 consecutive I/O locations).
2:1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.13 Secondary Control Block Base Address (SCTLBA)—Offset 1Ch

This 4-byte I/O space is used in Native Mode for the Secondary Controller's Control Block.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SCTLBA: [B:0, D:19, F:0] + 1Ch

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

31:16	15:2	1	0
RSVD0	BAR	RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:2	0h RW	**Base Address (BAR):** Base address of the I/O space (4 consecutive I/O locations).
1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.14 Legacy IDE Base Address / AHCI Index Data Pair Base Address (LBAR)—Offset 20h

This BAR is used to allocate I/O space for the SFF-8038i mode of operation (aka Bus Master IDE) and if CC.SCC is not 01h, it is used to allocate I/O space for the AHCI index/data pair mechanism as well. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

LBAR: [B:0, D:19, F:0] + 20h

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

31:16	15:4	3:1	0
RSVD0	BA	RSVD1	RTE

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
15:4	0h RW	**Base Address (BA):** Base address of the I/O space. Note for Base Address bit 4: When CC.SCC is 01h, this bit will be RW resulting in requesting 16B of I/O space. When CC.SCC is not 01h, this bit will be RO=0 resulting in requesting 32B of I/O space.
3:1	0b RO	**RSVD1:** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

17.5.15 AHCI Base Address/Serial ATA Index Data Pair Base Address (ABAR)—Offset 24h

When the programming interface is not IDE (i.e. CC.SCC is not 01h), this register is named ABAR. When the programming interface is IDE, this register becomes SIDPBA. Note that hardware does not clear those BA bits when switching from IDE SKU to non-IDE SKU or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after SKU switching (as indicated by a change in CC.SCC). In the case, this register will then have to be re-programmed to a proper value. When the programming interface is not IDE, the register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. When the programming interface is IDE, the register becomes an I/O BAR allocating 16 bytes of I/O space for the I/O mapped registers defined in Memory Registers. Note that although 16 bytes of locations are allocated, only 8 bytes are used as SINDX and SDATA registers; with the remaining 8 bytes preserved for future enhancement.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

ABAR: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BA																												PF	TP		RTE

Bit Range	Default & Access	Description
31:4	0h RW	**Base Address (BA):** When programming interface is non IDE, this is base address of register memory space (aligned to 2 KB). Bits 31:11 are RW, bits 10:4 are RO of 0; When programming interface is IDE, this is base address of the I/O space. Bits 31:16 are RO of 0, bits 15:4 are RW
3	0h RO	**Prefetchable (PF):** When programming interface is non IDE, this indicates that this range is not prefetch-able
2:1	0h RO	**Type (TP):** When programming interface is non IDE, this indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** When programming interface is non IDE, this indicates a request for register memory space; When programming interface is IDE, this indicates a request for IO space.

17.5.16 Sub System Identifiers (SS)—Offset 2Ch

This register is initialized to logic 0 by the assertion of Backbone Reset. This register can be written only once after Backbone Reset de-assertion.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SS: [B:0, D:19, F:0] + 2Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSID																SSVID															

Bit Range	Default & Access	Description
31:16	0000h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0000h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

17.5.17 Capabilities Pointer (CAP)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

CAP: [B:0, D:19, F:0] + 34h

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
CP							

Bit Range	Default & Access	Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default which is meant for non-IDE mode: CAP.CP - 80h (MSI) - 70h (PCI Power) - A8h (SATA) - 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability.[Br] If BIOS intends to operate in IDE mode, BIOS is requested to program this field to 70h and the subsequent capability list as such: CAP.CP - 70h (PCI Power) - end. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.

17.5.18 Interrupt Information (INTR)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 16 bits)

INTR: [B:0, D:19, F:0] + 3Ch

Default: 0100h

15			12				8				4				0
0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
IPIN								ILINE							

Bit Range	Default & Access	Description
15:8	01h RO	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#.
7:0	00h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.5.19 Minimum Grant (MGNT)—Offset 3Eh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

MGNT: [B:0, D:19, F:0] + 3Eh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MGNT							

Bit Range	Default & Access	Description
7:0	00h RO	**MGNT:** Minimum Grant

17.5.20 Maximum Latency (MLAT)—Offset 3Fh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

MLAT: [B:0, D:19, F:0] + 3Fh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MLAT							

Bit Range	Default & Access	Description
7:0	00h RO	**MLAT:** Maximum Latency

17.5.21 Primary Timing (PTIM)—Offset 40h

This controls the timings driven on the parallel cable.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PTIM: [B:0, D:19, F:0] + 40h

Default: 0000h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DE	D1STE	ISP		RSVD0		RCT		DTE1	PPE1	IE1	TIM1	DTE0	PPE0	IE0	TIM0

Bit Range	Default & Access	Description
15	0h RW	**Decode Enable (DE):** Enables the SATA Controller to decode the Command Blocks (1F0-1F7h for primary, 170-177h for secondary or their native BAR equivalents) and Control Block (3F6h for primary and 376h for secondary or their native BAR equivalents). This bit still has functionality in SATA - if this bit is not set, the port that is mapped to this range will not be decoded.
14	0h RW	**Device 1 Separate Timing Enable (D1STE):** This register is not used by SATA controller.
13:12	0h RW	**IORDY Sample Point (ISP):** This register is not used by SATA controller.
11:10	0b RO	**RSVD0:** Reserved
9:8	0h RW	**Recovery Time (RCT):** This register is not used by SATA controller.
7	0h RW	**Device 1 DMA Timing Enable (DTE1):** This register is not used by SATA controller.
6	0h RW	**Device 1 Prefetch/Posting Enable (PPE1):** This register is not used by SATA controller.
5	0h RW	**Device 1 IORDY Sample Point Enable (IE1):** This register is not used by SATA controller.
4	0h RW	**Device 1 Fast Timing Bank (TIM1):** This register is not used by SATA controller.
3	0h RW	**Device 0 DMA Timing Enable (DTE0):** This register is not used by SATA controller.
2	0h RW	**Device 0 Prefetch/Posting Enable (PPE0):** This register is not used by SATA controller.
1	0h RW	**Device 0 IORDY Sample Point Enable (IE0):** This register is not used by SATA controller.
0	0h RW	**Device 0 Fast Timing Bank (TIM0):** This register is not used by SATA controller.

17.5.22 Secondary Timing (STIM)—Offset 42h

This controls the timings driven on the parallel cable.

Access Method

Type: PCI Configuration Register (Size: 16 bits)	**STIM:** [B:0, D:19, F:0] + 42h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DE	D1STE	ISP		RSVD0		RCT		DTE1	PPE1	IE1	TIM1	DTE0	PPE0	IE0	TIM0

Bit Range	Default & Access	Description
15	0h RW	**Decode Enable (DE):** Enables the SATA Controller to decode the Command Blocks (1F0-1F7h for primary, 170-177h for secondary or their native BAR equivalents) and Control Block (3F6h for primary and 376h for secondary or their native BAR equivalents). This bit still has functionality in SATA - if this bit is not set, the port that is mapped to this range will not be decoded.
14	0h RW	**Device 1 Separate Timing Enable (D1STE):** This register is not used by SATA controller.
13:12	0h RW	**IORDY Sample Point (ISP):** This register is not used by SATA controller.
11:10	0b RO	**RSVD0:** Reserved
9:8	0h RW	**Recovery Time (RCT):** This register is not used by SATA controller.
7	0h RW	**Device 1 DMA Timing Enable (DTE1):** This register is not used by SATA controller.
6	0h RW	**Device 1 Prefetch/Posting Enable (PPE1):** This register is not used by SATA controller.
5	0h RW	**Device 1 IORDY Sample Point Enable (IE1):** This register is not used by SATA controller.
4	0h RW	**Device 1 Fast Timing Bank (TIM1):** This register is not used by SATA controller.
3	0h RW	**Device 0 DMA Timing Enable (DTE0):** This register is not used by SATA controller.
2	0h RW	**Device 0 Prefetch/Posting Enable (PPE0):** This register is not used by SATA controller.
1	0h RW	**Device 0 IORDY Sample Point Enable (IE0):** This register is not used by SATA controller.
0	0h RW	**Device 0 Fast Timing Bank (TIM0):** This register is not used by SATA controller.

17.5.23 Device 1 IDE Timing (D1TIM)—Offset 44h

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

D1TIM: [B:0, D:19, F:0] + 44h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSVD							

Bit Range	Default & Access	Description
7:0	0h RW	**RSVD:** Reserved

17.5.24 Synchronous DMA Control (Synchronous_DMA_Control)—Offset 48h

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Synchronous_DMA_Control: [B:0, D:19, F:0] + 48h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSVD							

Bit Range	Default & Access	Description
7:0	0h RW	**RSVD:** Reserved

17.5.25 Synchronous_DMA_Timing—Offset 4Ah

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Synchronous_DMA_Timing: [B:0, D:19, F:0] + 4Ah

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															

Bit Range	Default & Access	Description
15:0	0h RW	**RSVD:** Reserved

17.5.26 IDE I/O Configuration (IIOC)—Offset 54h

This register is not used by SATA controller.

Access Method

Type: PCI Configuration Register (Size: 32 bits) **IIOC:** [B:0, D:19, F:0] + 54h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																															

Bit Range	Default & Access	Description
31:0	0h RW	**RSVD:** Reserved

17.5.27 PCI Power Management Capability ID (PID)—Offset 70h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **PID:** [B:0, D:19, F:0] + 70h

Default: A801h

15			12				8				4				0
1	0	1	0	1	0	0	0	0	0	0	0	0	0	0	1
NEXT								CID							

Bit Range	Default & Access	Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. This is recommended for non-IDE mode. If the controller is to operate in IDE mode, BIOS is requested to program this field to 00h indicating the end (recommended setting). The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	01h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

17.5.28 PCI Power Management Capabilities (PC)—Offset 72h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **PC:** [B:0, D:19, F:0] + 72h

Default: 4003h

15			12				8				4				0
0	1	0	0	0	0	0	0	0	0	0	0	0	0	1	1
PME_Support					D2_Support	D1_Support	Aux_Current			DSI	RSVD0	PMEC	VS		

Bit Range	Default & Access	Description
15:11	08h RO	**PME_Support:** By default with CC.SCC=01h, the default value is 00000 which indicates no PME Support in IDE mode. When CC.SCC is not 01h in non-IDE mode, the default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	**D2_Support:** The D2 state is not supported.
9	0h RO	**D1_Support:** The D1 state is not supported.
8:6	0h RO	**Aux_Current:** PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0b RO	**RSVD0:** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

17.5.29 PCI Power Management Control and Status (PMCS)—Offset 74h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **PMCS:** [B:0, D:19, F:0] + 74h

Default: 0008h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
PMES	RSVD0						PMEE	RSVD1				NSFRST	RSVD2	PS	

Bit Range	Default & Access	Description
15	0h RW	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. -Note: Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0.
14:9	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
8	0h RW	**PME Enable (PMEE):** When CC.SCC is not 01h, this bit is RW. When set, the SATA controller generates PME# from D3HOT on a wake event. Whenever CC.SCC=01h either by default or just being updated, hardware shall automatically change the attribute to RO of 0 since there is no PME Support in IDE mode. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru MAP.SMS.
7:4	0b RO	**RSVD1:** Reserved
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of Power_State commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the Power_State bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0b RO	**RSVD2:** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to PCI PM specification section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

17.5.30 Message Signaled Interrupt Identifier (MID)—Offset 80h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MID: [B:0, D:19, F:0] + 80h

Default: 7005h

15			12				8				4				0
0	1	1	1	0	0	0	0	0	0	0	0	0	1	0	1
NEXT								CID							

Bit Range	Default & Access	Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	05h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.5.31 Message Signaled Interrupt Message Control (MC)—Offset 82h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MC: [B:0, D:19, F:0] + 82h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0								C64	MME			MMC			MSIE

Bit Range	Default & Access	Description
15:8	0b RO	**RSVD0:** Reserved
7	0h RO	**64 Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field. Software must also make sure this bit is cleared to 0 when operating in legacy mode (for AHCI SKUs when GHC.AE = 0). This bit is RW when CC.SCC is not 01h and is read-only 0 when CC.SCC is 01h.

17.5.32 Message Signaled Interrupt Message Address (MA)—Offset 84h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MA: [B:0, D:19, F:0] + 84h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ADDR																														RSVD0	

Bit Range	Default & Access	Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0b RO	**RSVD0:** Reserved

17.5.33 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MD: [B:0, D:19, F:0] + 88h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA															

Bit Range	Default & Access	Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

17.5.34 Port Mapping Register (MAP)—Offset 90h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

MAP: [B:0, D:19, F:0] + 90h

Default: 0420h

15			12				8				4				0
0	0	0	0	0	1	0	0	0	0	1	0	0	0	0	0
RSVD0				SPD0		SPD		SMS		SC	RSVD1			MV	

Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:10	1h RO	**SATA Port Disable (SPD0):** A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPD. And only then BIOS configures the PCS.PxE.
9:8	0h RO	**SATA Port Disable (SPD):** A 1 in a bit position corresponding to the SATA port prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPD. And only then BIOS configures the PCS.PxE.
7:6	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 00b = IDE mode which requires LBC01.LBGE=1 (refer to LBC01, LBC23 and LBC45 register in SIR register space); 01b = AHCI mode; 10b = RAID mode; 11b = Reserved. Notes : SW shall not manipulate MAP.SMS during runtime operation; i.e. the OS will not do this. The BIOS may choose to switch from one mode to another during POST. IDE mode can be selected when AHCI and/or RAID are enabled. After switching from AHCI/RAID back to IDE mode, the number of usable ports on SATA Controller 1 shall be reduced to 4, dependent on SKUs. AHCI mode may only be selected when MV = 00b. AHCI mode may be selected when RAID feature is enabled by fuse. VLV does not support RAID mode. Programming these bits with values that are illegal will result in in-deterministic behavior by the HW.

Bit Range	Default & Access	Description
5	1h RW	**SATA Port-to-Controller Configuration (SC):** This bit changes number of SATA port availability within each SATA controller. When MAP.SPD[5] is 1 and MAP.SPD[4] is 1, this bit is reserved and is read-only 1 else it's RW-zero. When this bit is 0: Up to 2 SATA ports are available in the SATA controller 1 with port[1:0]. When this bit to 1: Up to 2 SATA ports are available in the SATA controller 1 with port [1:0]. For SMS=IDE mode, this bit should be 0 (note that this irrespective of the number of SATA ports). The number of port availability in this controller shall be discoverable thru this controller's config PCS.PxE, AHCI CAP.NP and AHCI PI[x] register fields. Prior to changing the state of this bit, all ports must be in quiescent state with no commands outstanding. Refer to Single and Dual Controller Switching Requirement for additional software and hardware requirements.
4:2	0b RO	**RSVD1:** Reserved
1:0	0h RO	**Map Value (MV):** This register is reserved.

17.5.35 Port Control and Status (PCS)—Offset 92h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == 0) as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to 1 prior to booting the OS, regardless as to whether or not a device is currently on the port.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

PCS: [B:0, D:19, F:0] + 92h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ORM	RSVD0	RSVD				P1P	P0P	RSVD1						P1E	P0E

Bit Range	Default & Access	Description
15	0h RW	**OOB Retry Mode (ORM):** When cleared, the SATA controller will not retry after an OOB failure. When set, the SATA controller will continue to retry after an OOB failure until successful (infinite retry). BIOS is requested to program this field to 1.
14	0b RO	**RSVD0:** Reserved
13:10	0h RO	**RSVD:** Reserved
9	0h RO	**Port 1 Present (P1P):** Same as P0P, except for port 1.

Bit Range	Default & Access	Description
8	0h RO	**Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. Note: For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1.
7:2	0b RO	**RSVD1:** Reserved
1	0h RW	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD.
0	0h RW	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. Note: The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 2 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us.

17.5.36 Test Mode Register (TM)—Offset 94h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

TM: [B:0, D:19, F:0] + 94h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RSVD (31:26)	PCD (25:24)	RSVD0 (23:0)

Bit Range	Default & Access	Description
31:26	0h RO	**Reserved (RSVD):** Reserved.
25:24	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally.
23:0	0b RO	**RSVD0:** Reserved

17.5.37 SATA General Configuration (SATAGC)—Offset 9Ch

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SATAGC: [B:0, D:19, F:0] + 9Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

REGLOCK	RSVD0	WRRSELMPS	RSVD1	URRE	URD	AIE	DEVIDSEL	FLRCSSEL	RSVD2

Bit Range	Default & Access	Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is requested to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process.
30:15	0b RO	**RSVD0:** Reserved
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller.
11:10	0b RO	**RSVD1:** Reserved
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. The value is product specific. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by Backbone Reset and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime.
6	0h RW/O	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature Disable Fuse 7 =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. 0 : 2822h; 1 : 2826h. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse 7 is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is requested to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h.
4:0	0b RO	**RSVD2:** Reserved

17.5.38 SATA Initialization Register Index (SIRI)—Offset A0h

Access Method

Type: PCI Configuration Register (Size: 8 bits)   **SIRI:** [B:0, D:19, F:0] + A0h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
IDX						RSVD0	

Bit Range	Default & Access	Description
7:2	00h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Note that this 256-byte register space setting is applicable to all ports in both SATA controllers 1 and 2 (if supported). Refer to SATA Initialization Register section for detail of the register space.
1:0	0b RO	**RSVD0:** Reserved

17.5.39 SATA Initialization Register Data (SIRD)—Offset A4h

Access Method

Type: PCI Configuration Register (Size: 32 bits)   **SIRD:** [B:0, D:19, F:0] + A4h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DTA																															

Bit Range	Default & Access	Description
31:0	00000000h RW	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

17.5.40 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

This register shall be read-only 0 when CC.SCC is 01h. Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Access Method

Type: PCI Configuration Register (Size: 32 bits)   **SATACR0:** [B:0, D:19, F:0] + A8h

Default: 00100012h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
RSVD0								MAJREV				MINREV				NEXT								CAP							

Bit Range	Default & Access	Description
31:24	0b RO	**RSVD0:** Reserved
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	00h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO.
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

17.5.41 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

This register shall be read-only 0 when CC.SCC is 01h.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SATACR1: [B:0, D:19, F:0] + ACh

Default: 00000048h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
RSVD0																BAROFST												BARLOC			

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:4	004h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset ... FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h =) BAR0; 0101b = 14h =) BAR1; 0110b = 18h =) BAR2; 0111b = 1Ch =) BAR3; 1000b = 20h =) LBAR; 1001b = 24h =) BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

17.5.42 FLR Capability ID (FLRCID)—Offset B0h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

FLRCID: [B:0, D:19, F:0] + B0h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
NEXT								CID							

Bit Range	Default & Access	Description
15:8	00h RO	**Next Capability (NEXT):** 00h indicating the final item in the Capability List.
7:0	00h RO	**Capability ID (CID):** The value of this field depends on the FLRCSSEL bit. SATAGC.FLRCSSEL = 0, Capability ID = 13h; SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

17.5.43 FLR Control (FLRCTL)—Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

Access Method

Type: PCI Configuration Register (Size: 16 bits)

FLRCTL: [B:0, D:19, F:0] + B4h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD															

Bit Range	Default & Access	Description
15:0	0h RO	**RSVD:** Reserved

17.5.44 Scratch Pad (SP)—Offset D0h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SP: [B:0, D:19, F:0] + D0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DT																															

Bit Range	Default & Access	Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

17.5.45 BIST FIS Control/Status (BFCS)—Offset E0h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BFCS: [B:0, D:19, F:0] + E0h

Default: 00000000h

31:12	11	10	9	8	7:2	1:0
0000 0000 0000 0000 0000	0	0	0	0	0000 00	00
RSVD0	BFS	BFF	P1BFI	P0BFI	BFP	RSVD1

Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11	0h RW	**BIST FIS Successful (BFS):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device
10	0h RW	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS.
7:2	0h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0b RO	**RSVD1:** Reserved

17.5.46 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

BFTD1: [B:0, D:19, F:0] + E4h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DATA

Bit Range	Default & Access	Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

17.5.47 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BFTD2: [B:0, D:19, F:0] + E8h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DATA

Bit Range	Default & Access	Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

17.5.48 Manufacturing ID (MFID)—Offset F8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MFID: [B:0, D:19, F:0] + F8h

Default: 08000FB1h

31			28				24				20				16				12				8				4				0
0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	1	0	0	0	1

RSVD0 | DPID | SID | MID | PID

Bit Range	Default & Access	Description
31:28	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
27:24	8h RO	**Dot portion of Process ID (DPID):** Indicates the dot. Process is reflected in bits [7:0]. The value is product specific.
23:16	0h RO	**Stepping Identifier (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. The value is product specific.
15:8	0Fh RO	**Manufacturer Identifier (MID):** Indicates Intel.
7:0	B1h RO	**Process/Dot Identifier (PID):** Indicates the Process. Dot is reflected in bits [27:24]. The value is product specific.

17.6 SATA Legacy IO Registers

Table 194. Summary of SATA Legacy I/O Registers—LBAR

Offset	Size	Register ID—Description	Default Value
0h	1	"Primary Command (PCMD)—Offset 0h" on page 1961	00h
2h	1	"Primary Status (PSTS)—Offset 2h" on page 1962	00h
4h	4	"Primary Descriptor Table Pointer (PDTP)—Offset 4h" on page 1962	00000000h
8h	1	"Secondary Command (SCMD)—Offset 8h" on page 1963	00h
Ah	1	"Secondary Status (SSTS)—Offset Ah" on page 1963	00h
Ch	4	"Secondary Descriptor Table Pointer (SDTP)—Offset Ch" on page 1964	00000000h
10h	4	"AHCI Index Register (INDEX)—Offset 10h" on page 1965	00000000h
14h	4	"AHCI Data Register (DATA)—Offset 14h" on page 1966	00000000h

17.6.1 Primary Command (PCMD)—Offset 0h

Access Method

Type: I/O Register
(Size: 8 bits)

PCMD: [LBAR] + 0h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSVD0				RWC	RSVD1		START

Bit Range	Default & Access	Description
7:4	0b RO	**RSVD0:** Reserved
3	0h RW	**Read / Write Control (RWC):** Sets the direction of the bus master transfer: 0 = memory to device, 1 = device to memory. This bit must not be changed when the bus master function is active.
2:1	0b RO	**RSVD1:** Reserved
0	0h RW	**Start/Stop Bus Master (START):** Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation. All state information is lost when this bit is written to 0; Master mode operation cannot be stopped and then resumed. If this bit is reset while bus master operation is still active and the device has not yet finished its data transfer, the bus master command is said to be aborted. If this bit is cleared to 0 prior to the DMA data transfer being initiated by the drive in a device to memory data transfer, then not DMAT will be sent to terminate the data transfer. SW intervention (e.g. sending SRST) is required to reset the interface in this condition. This bit is intended to be cleared by software after the data transfer is completed - as indicated by either the ACT bit being cleared in the status register, or the I bit being set in the status register, or both.

17.6.2 Primary Status (PSTS)—Offset 2h

Access Method

Type: I/O Register
(Size: 8 bits)

PSTS: [LBAR] + 2h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
S	D1DC	D0DC	RSVD0		I	ERR	ACT

Bit Range	Default & Access	Description
7	0h RO	**Simplex Only (S):** This read-only bit indicates whether or not I both bus master channels (primary and secondary) can be operated at the same time. If the bit is a 0, then the channels operate independently and can be used at the same time. If the bit is a 1, then only one channel may be used at a time.
6	0h RW	**Device 1 DMA Capable (D1DC):** A scratchpad bit set by SW to indicate that device 1 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
5	0h RW	**Device 0 DMA Capable (D0DC):** A scratchpad bit set by SW to indicate that device 0 of this channel is capable of DMA transfers. This bit has no effect on the hardware.
4:3	0b RO	**RSVD0:** Reserved
2	0h RW/1C	**Interrupt (I):** This bit is set when a device FIS is received with the I bit has been set provided that software has not disabled interrupt via the nIEN bit of Device Control Register.
1	0h RW/1C	**Error (ERR):** This bit is set when the controller encounters an error during the transfer and must stop the transfer. See Error Handling for the list of errors that set this bit.
0	0h RO	**Active (ACT):** Set by the host when the START bit is written to the Command register, and cleared by the host when the last transfer for a region is performed, where EOT for that region is set in the region descriptor, and when the START bit is cleared in the Command register and the controller has returned to an idle condition.

17.6.3 Primary Descriptor Table Pointer (PDTP)—Offset 4h

Access Method

Type: I/O Register
(Size: 32 bits)

PDTP: [LBAR] + 4h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

RSVD0																					INDEX									RSVD1	

Bit Range	Default & Access	Description
31:11	0b RO	**RSVD0:** Reserved
10:2	000h RO	**Index (INDEX):** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0b RO	**RSVD1:** Reserved

17.6.8 AHCI Data Register (DATA)—Offset 14h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/ SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Access Method

Type: I/O Register
(Size: 32 bits)

DATA: [LBAR] + 14h

LBAR Type: PCI Configuration Register (Size: 32 bits)
LBAR Reference: [B:0, D:19, F:0] + 20h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA																															

Bit Range	Default & Access	Description
31:0	00000000h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

17.7 SATA Index Pair IO Registers

Table 195. Summary of SATA Index Pair I/O Registers—ABAR

Offset	Size	Register ID—Description	Default Value
0h	4	“Serial ATA Index (SINDX)—Offset 0h” on page 1967	00000000h
4h	4	“Serial ATA Data (SDATA)—Offset 4h” on page 1968	00000000h

17.7.1 Serial ATA Index (SINDX)—Offset 0h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

Access Method

Type: I/O Register
(Size: 32 bits)

SINDX: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

Bits	31:16	15:8	7:0
Default	0000 0000 0000 0000	0000 0000	0000 0000
Field	RSVD0	PIDX	RIDX

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RW	**Port Index (PIDX):** This index field is used to specify the port of the SATA controller that the port specific SerialATA Status (SSTS), SerialATA Control (SCTL) and SerialATA Error (SERR) registers are to be read from or write to. 00h = Primary Master (Port 0); 01h = Primary Slave (Port 2); 02h = Secondary Master (Port 1); 03h = Secondary Slave (Port 3).
7:0	00h RW	**Register Index (RIDX):** This index field is used to specify one out of three registers currently being indexed into. These three registers are the Serial ATA superset SStatus, SControl and SError memory registers and are port specific, hence for this SATA controller, there are four sets of these registers. Refer to Offset 128h, 1A8h, 228h, 2A8h, 328h, 3A8h: PxSSTS - Port [0-5] Serial ATA Status, Offset 12Ch, 1ACh, 22Ch, 2ACh, 32Ch, 3ACh: PxSCTL - Port [0-5] Serial ATA Control, and Offset 130h, 1B0h, 230h, 2B0h, 330h, 3B0h: PxSERR - Port [0-5] Serial ATA Error for definitions of the SStatus, SControl and SError registers. 00h = SSTS; 01h = SCTL; 02h = SERR.

17.7.2 Serial ATA Data (SDATA)—Offset 4h

All of these I/O registers are in the core well. They are exposed only when CC.SCC is 01h (i.e. IDE programming interface). These are Index/Data Pair registers that are used to access the SerialATA superset registers (SerialATA Status, SerialATA Control and SerialATA Error). The I/O space for these registers is allocated through SIDPBA. Locations with offset from 08h to 0Fh are reserved for future expansion. Software write operations to the reserved locations shall have no effect while software read operations to the reserved locations shall return 0. Refer to Serial ATA Index/Data Pair Superset Registers for more details.

Access Method

Type: I/O Register
(Size: 32 bits)

SDATA: [ABAR] + 4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DATA																															

Bit Range	Default & Access	Description
31:0	00000000h RW	**Data (DATA):** This Data register is a window through which data is read or written to from the register pointed to by the Serial ATA Index (SINDX) register above. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by SINDX.RIDX field.

17.8 SATA AHCI Memory Mapped IO Registers

Table 196. Summary of SATA AHCI Memory Mapped I/O Registers—ABAR

Offset	Size	Register ID—Description	Default Value
0h	4	"HBA Capabilities (GHC_CAP)—Offset 0h" on page 1970	DF20FF02h
4h	4	"HBA Capabilities (GHC_CAP)—Offset 0h" on page 1970	00000000h

584h	4	"Enclosure Management LED (EM_LED)—Offset 584h" on page 2005	00000000h

17.8.1 HBA Capabilities (GHC_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

GHC_CAP: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: DF20FF02h

31			28				24				20				16				12				8				4				0
1	1	0	1	1	1	1	1	0	0	1	0	0	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0	0	1	0
S64A	SCQA	SSNTF	SMPS	SSS	SALP	SAL	SCLO	ISS				SNZO	SAM	SMP	FBSS	PMD	SSC	PSC	NCS					CCCS	EMS	SXS	NP				

Bit Range	Default & Access	Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queuing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	0h RO	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0, the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.

Bit Range	Default & Access	Description
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and its associated function. When cleared to 0, The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue software reset if these bits are still set from a previous operation.
23:20	2h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved.
19	0h RO	**Supports Non-Zero DMA Offsets (SNZO):** Reserved as per AHCI 1.3
18	0h RW/O	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	0h RO	**Supports Port Multiplier (SMP):** Not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RO	**Enclosure Management Supported (EMS):** Not supported
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	02h RO	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 2 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

17.8.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GHC: [ABAR] + 4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

Bits	31	30:3	2	1	0
Default	0	0000 0000 0000 0000 0000 0000 0000	0	0	0
Field	AE	RSVD0	MRSM	IE	HR

Bit Range	Default & Access	Description
31	0h RW	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0b RO	**RSVD0:** Reserved
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME (MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC) 0 (multiple messages requested); MC.MME) 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is leass than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the AHCI specification, section 10.3.3.

17.8.3 Interrupt Status (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

IS: [ABAR] + 8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31:2	1	0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0
RSVD0	IPS1	IPS0

Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved
1	0h RW/1C	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

17.8.4 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

GHC_PI: [ABAR] + Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31:2	1	0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0
RSVD0	PI1	PI0

Bit Range	Default & Access	Description
31:2	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
1	0h RW/O	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

17.8.5 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

VS: [ABAR] + 10h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00010300h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MJR																MNR															

Bit Range	Default & Access	Description
31:16	0001h RO	**Major Version Number (MJR):** Indicates the major version is 1
15:0	0300h RO	**Minor Version Number (MNR):** Indicates the minor version is 30

17.8.6 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

GHC_CAP2: [ABAR] + 24h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000003Ch

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0
RSVD0																										DESO	SADM	SDS	APST	RSVD1	BOH

Bit Range	Default & Access	Description
31:6	0b RO	**RSVD0:** Reserved
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is requested to program this field to 1.
4	1h RW/O	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
2	1h RW/O	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. Note: If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0b RO	**RSVD1:** Reserved
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

17.8.7 Vendor Specific (VSP)—Offset A0h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

VSP: [ABAR] + A0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000048h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
RSVD0																									SFMS	PFS	PT	SRPIR	RSVD1		

Bit Range	Default & Access	Description
31:7	0b RO	**RSVD0:** Reserved
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.

Bit Range	Default & Access	Description
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0b RO	**RSVD1:** Reserved

17.8.8 Vendor Specific Capabilities (VS_CAP)—Offset A4h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

VS_CAP: [ABAR] + A4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 018002FEh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	1	1	1	1	1	0

Bits 31:16	Bits 15:12	Bits 11:1	Bit 0
PNRRO	RSVD0	MSL	PNMBRE

Bit Range	Default & Access	Description
31:16	0180h RO	**PCIe NAND Remapped Register Offset (PNRRO):** Specifies the DWORD offset within ABAR as to where the PCIe NAND AHCI BAR register space is remapped. Only valid when PNABRE = 1. This places the start of the PCIe NAND AHCI BAR register space at ABAR + 600h
15:12	0b RO	**RSVD0:** Reserved
11:1	17Fh RW	**Memory Space Limit. (MSL):** This field specifies the size of the remapped memory space for the PCIe NAND device. It is a 0-based field. Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated 2k AHCI memory space of the integrated AHCI controller. The reset default of this field is 17Fh (i.e. bit[11:1] = 00101111111b) which specifies the size of the remapped memory space as 384 bytes.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (PNMBRE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled.

17.8.9 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

RPID: [ABAR] + C0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00311C02h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	1	0	0	0	1	1	1	0	0	0	0	0	0	0	0	1	0
OFST																RPID															

Bit Range	Default & Access	Description
31:16	0031h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

17.8.10 Premium Feature Block (PFB)—Offset C4h

These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

PFB: [ABAR] + C4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0											RSVD_1	RSVD_2	RSVD_3	SEA	SOI

Bit Range	Default & Access	Description
15:5	0b RO	**RSVD0:** Reserved
4	0h RO	**Reserved (RSVD_1):** Read value is the same as VSP.PFS.
3	0h RO	**Reserved (RSVD_2):** Read value is the same as VSP.PFS.
2	0h RO	**Reserved (RSVD_3):** Read value is the same as VSP.PFS.
1	0h RO	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

17.8.11 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW.

Access Method

Type: Memory Mapped I/O Register (Size: 16 bits)

SFM: [ABAR] + C8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 003Fh

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
RSVD0				OROM_UI_Normal_Delay		Smart_Response_Technology	IRRT_Only_on_ESATA	LED_Locate	HDDUNLOCK	OROM_UI_and_BANNER	IRRT	R5	R10	R1	R0

Bit Range	Default & Access	Description
15:12	0b RO	**RSVD0:** Reserved
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to 1, then Smart Response Technology is enabled. If cleared to 0, the feature is disabled.
8	0h RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports. If cleared to 0, then any RAID volume can span internal and external SATA ports.
7	0h RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	**HDDUNLOCK:** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5:** If set to 1, then RAID5 is enabled
2	1h RW/O	**R10:** If set to 1, then RAID10 is enabled

Bit Range	Default & Access	Description
1	1h RW/O	**R1:** If set to 1, then RAID1 is enabled
0	1h RW/O	**R0:** If set to 1, then RAID0 is enabled

17.8.12 Port-Command List Base Address (PxCLB0)—Offset 100h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCLB0: [ABAR] + 100h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: CLB (bits 31:10), RSVD0 (bits 9:0)

Bit Range	Default & Access	Description
31:10	000000h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0b RO	**RSVD0:** Reserved

17.8.13 Port-Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCLBU0: [ABAR] + 104h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: CLBU (bits 31:0)

Bit Range	Default & Access	Description
31:0	00000000h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

17.8.14 Port-FIS Base Address (PxFB0)—Offset 108h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxFB0: [ABAR] + 108h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: FB (bits 31:8), RSVD0 (bits 7:0)

Bit Range	Default & Access	Description
31:8	0000000h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0b RO	**RSVD0:** Reserved

17.8.15 Port-FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxFBU0: [ABAR] + 10Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: FBU (bits 31:0)

Bit Range	Default & Access	Description
31:0	00000000h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

17.8.16 Port-Interrupt Status (PxIS0)—Offset 110h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxIS0: [ABAR] + 110h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21:8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0
CPDS	TFES	HBFS	HBDS	IFS	INFS	RSVD0	OFS	IPMS	PRCS	RSVD1	DMPS	PCS	DPS	UFS	SDBS	DSS	PSS	DHRS

Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	**RSVD0:** Reserved
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Not supported
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.

Bit Range	Default & Access	Description
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

17.8.17 Port-Interrupt Enable (PxIE0)—Offset 114h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxIE0: [ABAR] + 114h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	**RSVD0:** Reserved
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

17.8.18 Port-Command (PxCMD0)—Offset 118h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCMD0: [ABAR] + 118h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000004h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
ICC				ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD0	CR	FR	MPSS	CCS					RSVD1	PSP	APSE	FRE	CLO	POD	SUD	ST

Bit Range	Default & Access	Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleard to 0, software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software

Bit Range	Default & Access	Description
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	**Port Multiplier Attached (PMA):** Not supported
16	0b RO	**RSVD0:** Reserved
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	00h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	**RSVD1:** Reserved
6	0h RO	**PHYSLP Present (PSP):** If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.

Bit Range	Default & Access	Description
5	0h RW	**Aggressive PHYSLP Enable (APSE):** This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

17.8.19 Port-Task File Data (PxTFD0)—Offset 120h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxTFD0: [ABAR] + 120h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 0000007Fh

Bits	31:16	15:8	7	6:4	3	2:1	0
Default	0000 0000 0000 0000	0000 0000	0	111	1	11	1
Field	RSVD0	ERR	STS_BSY	STS_RSVD0	STS_DRQ	STS_RSVD1	STS_ERR

Bit Range	Default & Access	Description
31:16	0b RO	**RSVD0:** Reserved
15:8	00h RO	**Error (ERR):** Contains the latest copy of the task file error register.

Bit Range	Default & Access	Description
7	0h RO	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	7h RO	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

17.8.20 Port-Signature (PxSIG0)—Offset 124h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSIG0: [ABAR] + 124h

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0																				IPM				SPD				DET			

Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved

Bit Range	Default & Access	Description
11:8	0h RO	**Interface Power Management (IPM):** Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	**Device Detection (DET):** Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

17.8.22 Port-Serial ATA Control (PxSCTL0)—Offset 12Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSCTL0: [ABAR] + 12Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0												PMP				SPM				IPM				SPD				DET			

Bit Range	Default & Access	Description
31:20	0b RO	**RSVD0:** Reserved
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3hTransitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved

Bit Range	Default & Access	Description
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	**Device Detection Initialization (DET):** Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

17.8.23 Port-Serial ATA Error (PxSERR0)—Offset 130h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSERR0: [ABAR] + 130h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DIAG																ERR															

Bit Range	Default & Access	Description
31:16	0000h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCS interrupt status bit and an interrupt will be generated if enabled.

Bit Range	Default & Access	Description
15:0	0000h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

17.8.24 Port-Serial ATA Active (PxSACT0)—Offset 134h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxSACT0: [ABAR] + 134h

RSVD0			DM				DITO										MDAT					DETO								DSP	ADSE

Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:25	Fh RW/O	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	**DEVSLP Present (DSP):** If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

17.8.27 Port-Command List Base Address (PxCLB1)—Offset 180h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

PxCLB1: [ABAR] + 180h

ABAR Type: PCI Configuration Register (Size: 32 bits)

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CPDS	TFES	HBFS	HBDS	IFS	INFS	RSVD0	OFS	IPMS	PRCS	RSVD1														DMPS	PCS	DPS	UFS	SDBS	DSS	PSS	DHRS

Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0b RO	**RSVD0:** Reserved
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Not supported
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

17.8.32 Port-Interrupt Enable (PxIE1)—Offset 194h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Bit Range	Default & Access	Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0b RO	**RSVD0:** Reserved
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0b RO	**RSVD1:** Reserved
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Description
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

17.8.33 Port-Command (PxCMD1)—Offset 198h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCMD1: [ABAR] + 198h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000004h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
ICC				ASP	ALPE	DLAE	ATAPI	APSTE	FBSCP	ESP	CPD	MPSP	HPCP	PMA	RSVD0	CR	FR	MPSS	CCS					RSVD1	PSP	APSE	FRE	CLO	POD	SUD	ST

Bit Range	Default & Access	Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.

Bit Range	Default & Access	Description
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleard to 0, software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RO	**Port Multiplier Attached (PMA):** Not supported
16	0b RO	**RSVD0:** Reserved
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default & Access	Description
12:8	00h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0b RO	**RSVD1:** Reserved
6	0h RO	**PHYSLP Present (PSP):** If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.
5	0h RW	**Aggressive PHYSLP Enable (APSE):** This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

17.8.34 Port-Task File Data (PxTFD1)—Offset 1A0h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxTFD1: [ABAR] + 1A0h

SIG																															

Bit Range	Default & Access	Description
31:0	FFFFFFFFh RO	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

17.8.36 Port-Serial ATA Status (PxSSTS1)—Offset 1A8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSSTS1: [ABAR] + 1A8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	
RSVD0					IPM	SPD	DET	

Bit Range	Default & Access	Description
31:12	0b RO	**RSVD0:** Reserved
11:8	0h RO	**Interface Power Management (IPM):** Indicates the current interface state 0h = Device not present or communication not established. 1h = Interface in active state. 2h = Interface in PARTIAL power management state. 6h = Interface in SLUMBER power management state. 8h = PHYSLP asserted. All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an automatic partial to slumber transition occurs, PxSSTS.IPM shall reflect that the host has entered slumber (PxSSTS.IPM = 6h.)
7:4	0h RO	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. 0h = Device not present or communication not established. 1h = Generation 1 communication rate negotiated. 2h = Generation 2 communication rate negotiated. 3h = Generation 3 communication rate negotiated. All other values reserved
3:0	0h RO	**Device Detection (DET):** Indicates the interface device detection and Phy state. 0h = No device detected and Phy communication not established. 1h = Device presence detected but Phy communication not established. 3h = Device presence detected and Phy communication established. 4h = Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode. All other values reserved. Note that, while the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

17.8.37 Port-Serial ATA Control (PxSCTL1)—Offset 1ACh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSCTL1: [ABAR] + 1ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD0												PMP				SPM				IPM				SPD				DET			

Bit Range	Default & Access	Description
31:20	0b RO	**RSVD0:** Reserved
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3hTransitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	**Device Detection Initialization (DET):** Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h

17.8.38 Port-Serial ATA Error (PxSERR1)—Offset 1B0h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxSERR1: [ABAR] + 1B0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
DIAG																ERR															

Bit Range	Default & Access	Description
31:16	0000h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCS interrupt status bit and an interrupt will be generated if enabled.
15:0	0000h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

Bit Range	Default & Access	Description
31:0	00000000h RW/1S	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

17.8.40 Port-Commands Issued (PxCI1)—Offset 1B8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxCI1: [ABAR] + 1B8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CI

Bit Range	Default & Access	Description
31:0	00000000h RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

17.8.41 Port-Device Sleep (PxDEVSLP1)—Offset 1C4h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

PxDEVSLP1: [ABAR] + 1C4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 1E022852h

31			28				24				20				16				12				8				4				0
0	0	0	1	1	1	1	0	0	0	0	0	0	0	1	0	0	0	1	0	1	0	0	0	0	1	0	1	0	0	1	0
RSVD0			DM				DITO										MDAT					DETO								DSP	ADSE

Bit Range	Default & Access	Description
31:29	0b RO	**RSVD0:** Reserved
28:25	Fh RW/O	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	004h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	1h RW/O	**DEVSLP Present (DSP):** If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.

17.8.42 Enclosure Management Message Format (EM_MF)—Offset 580h

This register is not implemented in VLV.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

EM_MF: [ABAR] + 580h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:19, F:0] + 24h

Default: 00000000h

31			28				24				20				16				12				8				4				0

7h	1	"Primary Channel Status register (P_STATUS)—Offset 7h" on page 2009	00h

17.9.1 Primary Channel Error register (P_ERROR)—Offset 1h

Access Method

Type: I/O Register
(Size: 8 bits)

P_ERROR: [PCMDIDEBA] + 1h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0

P_ERROR_1

Bit Range	Default & Access	Description
7:0	00h RW	**Error (P_ERROR_1):** Error.

17.9.2 Primary Channel Sector Count register (P_SECTOR_COUNT)—Offset 2h

Access Method

Type: I/O Register
(Size: 8 bits)

P_SECTOR_COUNT: [PCMDIDEBA] + 2h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
P_SECTOR_COUNT_1							

Bit Range	Default & Access	Description
7:0	00h RW	**Sector Count (P_SECTOR_COUNT_1):** Sector Count.

17.9.3 Primary Channel Sector Number register (P_SECTOR_NUMBER)—Offset 3h

Access Method

Type: I/O Register
(Size: 8 bits)

P_SECTOR_NUMBER: [PCMDIDEBA] + 3h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
P_SECTOR_NUMBER_1							

Bit Range	Default & Access	Description
7:0	00h RW	**Sector Number (P_SECTOR_NUMBER_1):** Sector Number.

17.9.4 Primary Channel Cylinder Low register (P_CYL_LOW)—Offset 4h

Access Method

Type: I/O Register
(Size: 8 bits)

P_CYL_LOW: [PCMDIDEBA] + 4h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
P_CYL_LOW_1							

Bit Range	Default & Access	Description
7:0	00h RW	**Cylinder Low (P_CYL_LOW_1):** Cylinder Low.

17.9.5 Primary Channel Cylinder High register (P_CYL_HIGH)—Offset 5h

Access Method

Type: I/O Register
(Size: 8 bits)

P_CYL_HIGH: [PCMDIDEBA] + 5h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
P_CYL_HIGH_1							

Bit Range	Default & Access	Description
7:0	00h RW	**Cylinder High (P_CYL_HIGH_1):** Cylinder High.

17.9.6 Primary Channel Device register (P_DRIVE_HEAD)—Offset 6h

Access Method

Type: I/O Register
(Size: 8 bits)

P_DRIVE_HEAD: [PCMDIDEBA] + 6h

PCMDIDEBA Type: PCI Configuration Register (Size: 32 bits)
PCMDIDEBA Reference: [B:0, D:19, F:0] + FCh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RSVD0			P_DRIVE_HEAD_1	RSVD1

17.17.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword0: [Port: 0xA3] + (2200h + 0h)

Op Codes:
0h - Read, 1h - Write

Default: 00010080h

Bits	Default	Field
31:28	0 0 0 0	reg_txcfgchange_valid_delay_3_0
27:24	0 0 0 0	reg_txcfgchange_rst_delay_3_0
23	0	reserved500
22:18	0 0 0 0 0	reg_txcfgchange_width_4_0
17	0	reg_txcfgchange_ovrride
16	1	reg_tx2_soft_reset_n
15	0	reg_txswng_clksel
14	0	reg_rcvdetect_ovrd
13	0	reg_rcvdetected
12	0	reg_rcvdetectfinished
11	0	reg_rcvdetect_pulse_width_ovrd
10:8	0 0 0	reg_rcvdetect_pulse_width_2_0
7	1	reg_tx1_soft_reset_n
6	0	reg_tx_8b10b_bypass
5	0	reg_tx_laneup
4	0	reg_left_txfifo_rst_master2
3	0	reg_right_txfifo_rst_master2
2	0	reg_plllinksynch_ovrden
1	0	reg_plllinksynch_ovrd
0	0	reg_tx1_cmmdisparity

Bit Range	Default & Access	Description
31:28	0h RW	**reg_txcfgchange_valid_delay_3_0:** Controls counter to wait 128ns after txcfgchange asserts when coming out of reset. This will control phystatus de-assertion after reset. Note: Minimum value when programmed has to be 4'b0100 or greater.
27:24	0h RW	**reg_txcfgchange_rst_delay_3_0:** Counter value to delay txcfgchange toggle after coming out of reset.
23	0h RW	**reserved500:** reserved
22:18	0h RW	**reg_txcfgchange_width_4_0:** Tx power fsm output - divider ratio
17	0h RW	**reg_txcfgchange_ovrride:** Override txchfchange related counters. (reg_txcfgchange_width, reg_txcfgchange_valid_delay, reg_txcfgchange_rst_delay)
16	1h RW	**reg_tx2_soft_reset_n:** Active low reset to independently reset Tx lane2 in Display Port
15	0h RW	**reg_txswng_clksel:** When 0 selects divide by 2 version of the ick_plllink clock for Tx swing control logic When 1 selects ick_plllink clock for Tx swing control logic.
14	0h RW	**reg_rcvdetect_ovrd______________________:** override enable for rcvdetected and rcvdetectfinished
13	0h RW	**reg_rcvdetected_________________________:** override for rcvdetected
12	0h RW	**reg_rcvdetectfinished__________________:** override for rcvdetectfinished

Bit Range	Default & Access	Description
11	0h RW	**reg_rcvdetect_pulse_width_ovrd:** override enable for rcvdetect_pulse_width
10:8	0h RW	**reg_rcvdetect_pulse_width_2_0:** override value for rcvdetect_pusle_width
7	1h RW	**reg_tx1_soft_reset_n:** Active low reset to independently reset Tx lane1 in Display Port 0: Lane 1 reset 1: Lane 1 active
6	0h RW	**reg_tx_8b10b_bypass:** Bypass 8b10b encoder (for SAPIS etc interface.) 0 = Disable 8b/10b encoder bypass 1 = Enable 8b/10b encoder bypass
5	0h RW	**reg_tx_laneup:** Unused in Tx
4	0h RW	**reg_left_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
3	0h RW	**reg_right_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
2	0h RW	**reg_plllinksynch_ovrden:** Override enable for reg_plllinsync_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	**reg_plllinksynch_ovrd:** override value for plllinksynch
0	0h RW	**reg_tx1_cmmdisparity:** Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

17.17.2 PCS_DWORD1 (pcs_dword1)—Offset 4h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword1: [Port: 0xA3] + (2200h + 4h)

Op Codes:
0h - Read, 1h - Write

Default: 00600060h

Bits	Default	Field
31:24	0 0 0 0 0 0 0 0	reg_txfsm_4us_delay_7_0
23	0	reg_softreset_enable
22	1	cri_rxeb_eiosenable
21	1	cri_rxdigfiltsq_enable
20	0	reg_txfsm_delay_ovrd
19:16	0 0 0 0	reg_txfsm_4us_delay_11_8
15:14	0 0	reg_pclk_rate_1_0
13:12	0 0	reg_rate_1_0
11:9	0 0 0	reg_phymode_2_0
8	0	reg_modeovren
7:6	0 1	reg_datawidth
5	1	soft_reset_n
4	0	reg_diginelben
3	0	reg_digifelben
2	0	reg_strapgroup_ovrden
1	0	reg_yank_timer_done_b_ovrd
0	0	reg_yank_timer_done_b_ovrd_en

Bit Range	Default & Access	Description
31:24	0h RW	**reg_txfsm_4us_delay_7_0:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
23	0h RW	**reg_softreset_enable:** When '1' the soft_reset_n bit will contol the lane reset When '0' the hardware reset will control the lane reset Note for DP: In addition to soft_reset_n,which will reset both TX0 and TX 1 in the lane, the reg_tx1_soft_reset_n bit can be used to reset only TX1 in the lane and reg_tx2_soft_reset_n bit can be used to reset only TX2
22	1h RW	**cri_rxeb_eiosenable:** When 1 enables EIOS based Rx power down
21	1h RW	**cri_rxdigfiltsq_enable:** When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	**reg_txfsm_delay_ovrd:** Override enable bit for reg_txfsm_4us_delay
19:16	0h RW	**reg_txfsm_4us_delay_11_8:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
15:14	0h RW	**reg_pclk_rate_1_0:** Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	**reg_rate_1_0:** Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	**reg_phymode_2_0:** Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	**reg_modeovren:** When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	**reg_datawidth:** Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default) 10 - x16/x20 width 11 - x32/x40 width

Bit Range	Default & Access	Description
5	1h RW	**soft_reset_n:** Active low soft reset override
4	0h RW	**reg_diginelben:** Override for near end digital loopback.
3	0h RW	**reg_digifelben:** Override for far end digital loopback
2	0h RW	**reg_strapgroup_ovrden:** Override Enable for Strap Group
1	0h RW	**reg_yank_timer_done_b_ovrd:** Override for yank_timer_done_b
0	0h RW	**reg_yank_timer_done_b_ovrd_en:** Override Enable for yank_timer_done_b

17.17.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword2: [Port: 0xA3] + (2200h + 8h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h

Bits	Default	Field
31:28	0 0 0 0	reg_rxpwrfsm_pibiasoff_delay_3_0
27:24	0 0 0 0	cri_sqdbexittimer_override_3_0
23:18	0 0 0 0 0 0	cri_sqdbentrytimer_override_5_0
17:16	0 0	reg_rxdrcgtsqsel_1_0
15	0	cri_reut_SlaveSideDataCheckingEn
14	0	cri_sqdbtimer_ovren
13	0	cri_rxpwrfsm_timer_ovren
12	0	reg_rxidle
11	0	cri_rxrawdata_sel
10	0	cri_dynkalign_eco3302703_mode
9	0	cri_dynkalign_eco3302703_ovren
8	0	reg_rxpwrfsm_pibiasoff_ovrride
7	0	cri_reset_kalignlck
6	0	cri_ebptrrst
5	0	cri_comdispfix
4	0	cri_forcebankhit
3:2	0 0	cri_kalignmode_1_0
1	0	cri_skpprocdis
0	0	cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	**reg_rxpwrfsm_pibiasoff_delay_3_0:** Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	**cri_sqdbexittimer_override_3_0:** Rx squelch exit debounce timer
23:18	0h RW	**cri_sqdbentrytimer_override_5_0:** Rx squelch entry debounce timer
17:16	0h RW	**reg_rxdrcgtsqsel_1_0:** Squelch output select

Bit Range	Default & Access	Description
15	0h RW	**cri_reut_SlaveSideDataCheckingEn:** Enable REUT slave side checking while in loopback slave
14	0h RW	**cri_sqdbtimer_ovren:** Squelch debounce timer override enable
13	0h RW	**cri_rxpwrfsm_timer_ovren:** Rx power management fsm timer override enable
12	0h RW	**reg_rxidle:** Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	**cri_rxrawdata_sel:** When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	**cri_dynkalign_eco3302703_mode:** Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	**cri_dynkalign_eco3302703_ovren:** Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	**reg_rxpwrfsm_pibiasoff_ovrride:** When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	**cri_reset_kalignlck:** When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	**cri_ebptrrst:** Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	**cri_comdispfix:** Chicken bit to force disparity in dynamic K-align mode
4	0h RW	**cri_forcebankhit:** Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	**cri_kalignmode_1_0:** KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	**cri_skpprocdis:** SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	**cri_elasticbuffer_maskdis:** Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

17.17.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword3: [Port: 0xA3] + (2200h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 5515ACAAh

31			28				24				20				16				12				8				4				0
0	1	0	1	0	1	0	1	0	0	0	1	0	1	0	1	1	0	1	0	1	1	0	0	1	0	1	0	1	0	1	0

cri_dfx_patbuf_55_48	cri_dfx_patbuf_63_56	cri_dfx_patbuf_71_64	cri_dfx_patbuf_79_72

Bit Range	Default & Access	Description
31:24	55h RW	**cri_dfx_patbuf_55_48:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	15h RW	**cri_dfx_patbuf_63_56:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	ACh RW	**cri_dfx_patbuf_71_64:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	AAh RW	**cri_dfx_patbuf_79_72:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.5 PCS_DWORD4 (pcs_dword4)—Offset 10h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword4: [Port: 0xA3] + (2200h + 10h)

Op Codes:
0h - Read, 1h - Write

Default: 575555C1h

31			28				24				20				16				12				8				4				0

cri_dfx_patbuf_23_16	cri_dfx_patbuf_31_24	cri_dfx_patbuf_39_32	cri_dfx_patbuf_47_40

Bit Range	Default & Access	Description
31:24	57h RW	**cri_dfx_patbuf_23_16:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	55h RW	**cri_dfx_patbuf_31_24:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	55h RW	**cri_dfx_patbuf_39_32:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

Bit Range	Default & Access	Description
7:0	C1h RW	**cri_dfx_patbuf_47_40:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.6 PCS_DWORD5 (pcs_dword5)—Offset 14h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword5: [Port: 0xA3] + (2200h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00003E63h

Bits	31	30:28	27:26	25	24	23	22	21	20	19	18	17	16	15:8	7:0
Default	0	000	00	0	0	0	0	0	0	0	0	0	0	0011 1110	0110 0011
Field	cri_dfx_patbuftrain	cri_dfx_prbspoly_2_0	cri_dfx_patbufsize_1_0	cri_dfx_patbufloop	cri_dfx_patbufdwidth	cri_dfx_patbuftrainovr	cri_dfx_marginmode	cri_dfx_chk_sel	cri_dfx_patchken	cri_dfx_patgenen	cri_dfx_clrerrcnt	cri_dfx_lcereset	cri_dfx_lcestart	cri_dfx_patbuf_15_8	cri_dfx_patbuf_7_0

Bit Range	Default & Access	Description
31	0h RW	**cri_dfx_patbuftrain:** Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	**cri_dfx_prbspoly_2_0:** PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - x^16 + x^5 + x^4 + x^3 + 1 (USB3/PCIe Scrambler) (8b) 001 - x^16 + x^15 + x^13 + x^4 + 1 (SATA scrambler) (8b) 010 - x^31 + x^28 + 1 (8b) 011 - x^7 + x^6 + 1 (8b) 100 - x^15 + x^14 + 1 (10b) 101 - x^23 + x^18 + 1 (10b) 110 - x^31 + x^28 + 1 (10b) 111 - x^7 + x^6 + 1 (10b)
27:26	0h RW	**cri_dfx_patbufsize_1_0:** Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCEDATAWIDTH (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	**cri_dfx_patbufloop:** Pattern Buffer Looping Enable Enables looping of the Patter Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	**cri_dfx_patbufdwidth:** Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/ retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	**cri_dfx_patbuftrainovr:** Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Patter Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training

Bit Range	Default & Access	Description
22	0h RW	**cri_dfx_marginmode:** Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	**cri_dfx_chk_sel:** Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-)8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	**cri_dfx_patchken:** Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	**cri_dfx_patgenen:** Pattern Generator Enable This will activate the DFx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	**cri_dfx_clrerrcnt:** Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	**cri_dfx_lcereset:** Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	**cri_dfx_lcestart:** Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	**cri_dfx_patbuf_7_0:** Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	**cri_dfx_patbuf_15_8:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.17.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword6: [Port: 0xA3] + (2200h + 18h)

Op Codes:
0h - Read, 1h - Write

Default: FFFFFFFFh

31:24	23:16	15:8	7:0
1 1 1 1 1 1 1 1	1 1 1 1 1 1 1 1	1 1 1 1 1 1 1 1	1 1 1 1 1 1 1 1
cri_dfx_prbsseed_7_0	cri_dfx_prbsseed_15_8	cri_dfx_prbsseed_23_16	cri_dfx_prbsseed_31_24

Bit Range	Default & Access	Description
31:24	FFh RW	**cri_dfx_prbsseed_7_0:** PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.

Bit Range	Default & Access	Description
23:16	FFh RW	**cri_dfx_prbsseed_15_8:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
15:8	FFh RW	**cri_dfx_prbsseed_23_16:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
7:0	FFh RW	**cri_dfx_prbsseed_31_24:** PRBS Seed See cri_dfx_prbsseed[7:0] description.

17.17.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA3] + (2200h + 1Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00000009h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Default	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 0 0 1

Bits	Field
31:24	dfx_cri_errcnt_7_0
23:16	dfx_cri_errcnt_15_8
15	i_rxcaldone
14	dfx_cri_lcemgnerr
13	cri_dfx_patgen2active
12	dfx_cri_patbufallfail
11	dfx_cri_patchkactive
10	dfx_cri_patgenactive
9	dfx_cri_lcetraindone
8	dfx_cri_lcetrainactive
7	reserved501
6	cri_dfx_patgen2en
5:4	cri_dfx_maxerrcnt_1_0
3:0	cri_dfx_prbstraincnt_3_0

Bit Range	Default & Access	Description
31:24	X RO	**dfx_cri_errcnt_7_0:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
23:16	X RO	**dfx_cri_errcnt_15_8:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
15	X RO	**i_rxcaldone:** RX Calibration Cycles Complete Indicator
14	X RO	**dfx_cri_lcemgnerr:** Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	**cri_dfx_patgen2active:** Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	**dfx_cri_patbufallfail:** Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occured during training.
11	X RO	**dfx_cri_patchkactive:** Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	**dfx_cri_patgenactive:** Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).

Bit Range	Default & Access	Description
9	X RO	**dfx_cri_lcetraindone:** Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	**dfx_cri_lcetrainactive:** Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	**reserved501:** reserved
6	0h RW	**cri_dfx_patgen2en:** Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	**cri_dfx_maxerrcnt_1_0:** Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^16 (default) 01 : 2^10 10 : 2^8 11 : 2^4
3:0	9h RW	**cri_dfx_prbstraincnt_3_0:** PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

17.17.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword8: [Port: 0xA3] + (2200h + 20h)

Op Codes:

0h - Read, 1h - Write

Default: 000000C4h

Bits	Default	Field
31	0	reg_partial
30	0	reg_slumber
29:27	000	reg_tx2_cdr_override_2_0
26:24	000	reg_cdr_override_2_0
23	0	reg_ebuffmode
22:21	00	reg_usedclockchannel_1_0
20	0	reg_usedclockchannel_ovrride
19	0	reg_gbl_ovrride
18	0	reg_tx1_pclkon_inp2
17	0	reg_tx2_pclkon_inp2
16	0	reg_tx2_txenable
15:12	0000	cri_rxeb_ptr_init_3_0
11	0	reg_powerfsm_ovrride

9	0	reg_pclkcfginput
8	0	reg_useqclock
7:4	1100	cri_rxeb_hiwater_3_0
3:0	0100	cri_rxeb_lowater_3_0

Bit Range	Default & Access	Description
31	0h RW	**reg_partial:** Override for i_partial
30	0h RW	**reg_slumber:** Override for i_slumber
29:27	0h RW	**reg_tx2_cdr_override_2_0:** Override for cdr_override strap for second tx2

Bit Range	Default & Access	Description
26:24	0h RW	**reg_cdr_override_2_0:** Override for cdr_override strap
23	0h RW	**reg_ebuffmode:** Override for ebuffmode (no functionality in p1271 phase1 design)
22:21	0h RW	**reg_usedclockchannel_1_0:** Selects the active clock channel
20	0h RW	**reg_usedclockchannel_ovrride:** When asserted selects reg_usedclockchannel[1:0]
19	0h RW	**reg_gbl_ovrride:** Global override select
18	0h RW	**reg_tx1_pclkon_inp2:** When asserted keeps PCLK running in P2 mode. For DP this is used for Lane1
17	0h RW	**reg_tx2_pclkon_inp2:** When asserted keeps PCLK running in P2 mode. This is reserved (no impact) for PCIe/DMI and used for DP Lane2
16	0h RW	**reg_tx2_txenable:** Override for i_txenable for tx2
15:12	0h RW	**cri_rxeb_ptr_init_3_0:** Config override for initial value of Rx elastic buffer read pointer
11	0h RW	**reg_powerfsm_ovrride:** When asserted overrides for Tx power fsm are selected
10	0h RW	**reg_suspend:** Override for suspend
9	0h RW	**reg_pclkcfginput:** Override for pclkcfginput strap
8	0h RW	**reg_useqclock:** Override for useqclock; MUX select for I or Q clk for TX clocking
7:4	Ch RW	**cri_rxeb_hiwater_3_0:** Elastic buffer high watermark based on which SKP is removed
3:0	4h RW	**cri_rxeb_lowater_3_0:** Elastic buffer low watermark based on which SKP is added

17.17.10 PCS_DWORD9 (pcs_dword9)—Offset 24h

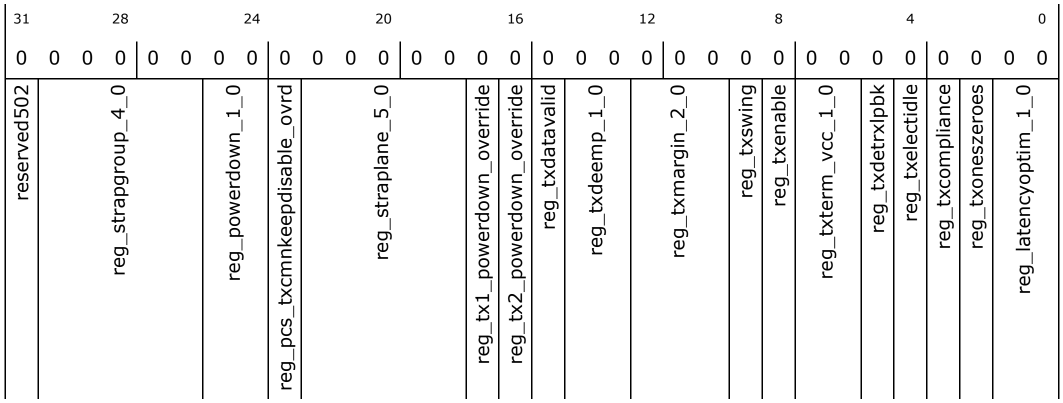
Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword9: [Port: 0xA3] + (2200h + 24h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h



Bit Range	Default & Access	Description
31	0h RW	**reserved502:** reserved
30:26	0h RW	**reg_strapgroup_4_0:** Override for i_strapgroup
25:24	0h RW	**reg_powerdown_1_0:** Override for i_powerdown
23	0h RW	**reg_pcs_txcmnkeepdisable_ovrd:** Override for ipcs_txcmnkeepdisable input 0: Use value on ipcs_txcmnkeepdisable input pin to determine o_txgohighz state in P2/ slumber 1: Force pcs_txcmnkeepdisable to 0
22:18	0h RW	**reg_straplane_5_0:** Override for i_straplane
17	0h RW	**reg_tx1_powerdown_override:** Overrides i_powerdown[1:0] indication from MAC for Tx1 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
16	0h RW	**reg_tx2_powerdown_override:** Overrides i_powerdown[1:0] indication from MAC for Tx2 1 : selects reg_powerdown[1:0] 0 : selects i_powerdown[1:0]
15	0h RW	**reg_txdatavalid:** Override for i_txdatavalid (register is NOT used)
14:13	0h RW	**reg_txdeemp_1_0:** Override for i_txdeemph
12:10	0h RW	**reg_txmargin_2_0:** Override for i_txmargin
9	0h RW	**reg_txswing:** Override for i_txswing
8	0h RW	**reg_txenable:** Override for i_txenable
7:6	0h RW	**reg_txterm_vcc_1_0:** Override for txterm_vcc strap
5	0h RW	**reg_txdetrxlpbk:** Override for i_txdetrxlpbk
4	0h RW	**reg_txelectidle:** Override for i_txelectidle
3	0h RW	**reg_txcompliance:** Override for i_txcompliance

Bit Range	Default & Access	Description
2	0h RW	**reg_txoneszeroes:** Override for i_txoneszeroes
1:0	0h RW	**reg_latencyoptim_1_0:** Override for i_latencyoptim

30:28	0h RW	**squelch_shunt_cnt_2_0:** Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	**reserved520:** reserved
26	0h RW	**i_rxsqfsm_timersel:** Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.

Bit Range	Default & Access	Description
25	0h RW	**i_rxsq_asyncmode_h:** Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualfiy it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	**i_rxsquelchstby_h:** Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
31:24	0h RW	**reserved528:** reserved
23:17	0h RW	**reserved527:** reserved
16	1h RW	**cri_lanereset_clkgatectl:** 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	**cri_lanereqforce:** Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	**cri_susclkdisable_delay_4_0:** This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay .... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	**cri_data_dynclkgate_mode_1_0:** Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.
7	0h RW	**cri_eios_waittime_ovren:** EIOS Wait Time Override Enable for Rx Turn OFF 0: hardware value for EIOS wait timer is selected. 1: selects cri_eios_waittime[6:0]
6:0	20h RW	**cri_eios_waittime_6_0:** EIOS Wait Time for Rx Turn OFF Represents override value timer in PCS that comes into play during EIOS based turn off Rx (Rx L0s) 0000000 - Timer is bypassed 0000001 - 1 PLL link clock period delay (2ns) 0000010 - 2 PLL link clock period delay (4ns) ... 0100000 - 32 PLL link clock periods delay (64ns) - default

Bit Range	Default & Access	Description
31:24	55h RW	**omargin010_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~2/3Vp2p
23:16	80h RW	**omargin000_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p. To be used in Gen2 mode (Gen1/Gen2 depend on dataratefit and downscaleamp register)
15:8	98h RW	**ouniqtranscale_7_0:** scales the number of slices defined the ref circuit (or R-comp circuit) by factor of ouniqtranscale[7:0]/128 The scaled amount of slices might be used in the full-swing Uis according to ouniqetrangenmethod[1:0] The scaled amount of slices might be used in the full-swing Uis according to oscaledcompmethod[1:0]
7	0h RO	**reserved511:** reserved
6:0	3Ah RW	**ofrcslices_6_0:** number of used slices if forced Used in compensated GPIO mode

17.18.4 TX_DWORD3 (tx_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

tx_dword3: [Port: 0xA6] + (280h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0C782040h

31	30	29:28	27:26	25	24	23:16	15:8	7:0
0	0	0 0	1 1	0	0	0 1 1 1 1 0 0 0	0 0 1 0 0 0 0 0	0 1 0 0 0 0 0 0
opisorate8b_h	obeacondivratio	ouniqetrangenmethod_1_0	oscaledcompmethod_1_0	odeemswinggenmethod	odownscaleampmethod	omargin101_7_0	omargin100_7_0	omargin011_7_0

Bit Range	Default & Access	Description
31	0h RW	**opisorate8b_h:** if '0' the PISO is of 10 bits (the whole bus) if '1' the PISO is of 8 bits (The LSBs) It's relevant both in normal Tx and in loopback mode. Use: '1' in PCI-E gen 3 and CIO (if supported) '0' for all other interfaces
30	0h RW	**obeacondivratio:** Div ration of beacon signal from ick_suslow clock '0' - Beacon freq will be as sus clock freq '1' - Beacon freq will be 1/4 of sus clock freq (note LFPS spec is 10-50MHz)
29:28	0h RW	**ouniqetrangenmethod_1_0:** Used to define if we use uniq-transition-bit scaling or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't activate uniq-transition-bit When '01' - if fast-clock is not divided (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. When '10' - if fast-clock is not divided or divided by 2 (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. (will probably be down-scaling amount of slices) When '11' - activate uniq-transition-bit
27:26	3h RW	**oscaledcompmethod_1_0:** Used to define if we use scaling of the compansation values or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't used scaled comp When '01' - if fast-clock is not divided (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp When '10' - if fast-clock is not divided or divided by 2 (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp (will probably be down-scaling amount of slices) When '11' - if fast-clock is not divided (gen2?) use scaled-comp otherwise (gen1?) don't use scaled-comp (will probably be up-scaling amount of slices)
25	0h RW	**odeemswinggenmethod:** Used to select scaling of -3.5dB deemphasis either ow2tapgen1deemph3p5[7:0] or ow2tapgen2deemph3p5[7:0] When '0' - if fast-clock is not divided use gen2 otherwise use gen1 When '1' - if fast-clock is not divided or divided by 2 use gen2 otherwise use gen1
24	0h RW	**odownscaleampmethod:** when margin='001', this bit with dataratefit are used to select between margin000 (for gen2) and margin101 (for gen1) when '0' - if fast-clock is not divided use margin000 (gen2) otherwise use margin101 (gen1) when '1' - if fast-clock is not divided or divided by 2 use margin000 (gen2) otherwise use margin101 (gen1)
23:16	78h RW	**omargin101_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p to be used in Gen1 mode (Gen1/Gen2 depends on dataratefit and downscaleamp register)
15:8	20h RW	**omargin100_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/4Vp2p

Bit Range	Default & Access	Description
7:0	40h RW	**omargin011_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/2Vp2p

17.18.5 TX_DWORD4 (tx_dword4)—Offset 10h

Access Method

Type: Message Bus Register
(Size: 32 bits)

tx_dword4: [Port: 0xA6] + (280h + 10h)

Op Codes:
0h - Read, 1h - Write

17.19.1 PCS_DWORD0 (pcs_dword0)—Offset 0h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword0: [Port: 0xA3] + (2400h + 0h)

Op Codes:
0h - Read, 1h - Write

Default: 00010080h

Bits	31:28	27:24	23	22:18	17	16	15	14	13	12	11	10:8	7	6	5	4	3	2	1	0
Default	0 0 0 0	0 0 0 0	0	0 0 0 0 0	0	1	0	0	0	0	0	0 0 0	1	0	0	0	0	0	0	0
Field	reg_txcfgchange_valid_delay_3_0	reg_txcfgchange_rst_delay_3_0	reserved500	reg_txcfgchange_width_4_0	reg_txcfgchange_ovrride	reg_tx2_soft_reset_n	reg_txswng_clksel	reg_rcvdetect_ovrd___	reg_rcvdetected___	reg_rcvdetectfinished___	reg_rcvdetect_pulse_width_ovrd	reg_rcvdetect_pulse_width_2_0	reg_tx1_soft_reset_n	reg_tx_8b10b_bypass	reg_tx_laneup	reg_left_txfifo_rst_master2	reg_right_txfifo_rst_master2	reg_plllinksynch_ovrden	reg_plllinksynch_ovrd	reg_tx1_cmmdisparity

Bit Range	Default & Access	Description
31:28	0h RW	**reg_txcfgchange_valid_delay_3_0:** Controls counter to wait 128ns after txcfgchange asserts when coming out of reset. This will control phystatus de-assertion after reset. Note: Minimum value when programmed has to be 4'b0100 or greater.
27:24	0h RW	**reg_txcfgchange_rst_delay_3_0:** Counter value to delay txcfgchange toggle after coming out of reset.
23	0h RW	**reserved500:** reserved
22:18	0h RW	**reg_txcfgchange_width_4_0:** Tx power fsm output - divider ratio
17	0h RW	**reg_txcfgchange_ovrride:** Override txchfchange related counters. (reg_txcfgchange_width, reg_txcfgchange_valid_delay, reg_txcfgchange_rst_delay)
16	1h RW	**reg_tx2_soft_reset_n:** Active low reset to independently reset Tx lane2 in Display Port
15	0h RW	**reg_txswng_clksel:** When 0 selects divide by 2 version of the ick_plllink clock for Tx swing control logic When 1 selects ick_plllink clock for Tx swing control logic.
14	0h RW	**reg_rcvdetect_ovrd_______________________:** override enable for rcvdetected and rcvdetectfinished
13	0h RW	**reg_rcvdetected___________________________:** override for rcvdetected
12	0h RW	**reg_rcvdetectfinished___________________:** override for rcvdetectfinished
11	0h RW	**reg_rcvdetect_pulse_width_ovrd:** override enable for rcvdetect_pulse_width
10:8	0h RW	**reg_rcvdetect_pulse_width_2_0:** override value for rcvdetect_pusle_width
7	1h RW	**reg_tx1_soft_reset_n:** Active low reset to independently reset Tx lane1 in Display Port 0: Lane 1 reset 1: Lane 1 active
6	0h RW	**reg_tx_8b10b_bypass:** Bypass 8b10b encoder (for SAPIS etc interface.) 0 = Disable 8b/10b encoder bypass 1 = Enable 8b/10b encoder bypass

Bit Range	Default & Access	Description
5	0h RW	**reg_tx_laneup:** Unused in Tx
4	0h RW	**reg_left_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
3	0h RW	**reg_right_txfifo_rst_master2:** override enable = reg_lanedeskew_strap_ovrd
2	0h RW	**reg_plllinksynch_ovrden:** Override enable for reg_plllinsync_ovrd 0 = Use default delay in hardware 1 = Use reg_plllinksynch_ovrd
1	0h RW	**reg_plllinksynch_ovrd:** override value for plllinksynch
0	0h RW	**reg_tx1_cmmdisparity:** Sets the initial disparity during Compliance Measurement Mode, used together with pcs_txcompliance pulse. 0 = set negative disparity 1 = set positive disparity

17.19.2 PCS_DWORD1 (pcs_dword1)—Offset 4h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword1: [Port: 0xA3] + (2400h + 4h)

Op Codes:
0h - Read, 1h - Write

Default: 00600060h

Bits	Default	Field
31:24	0 0 0 0 0 0 0 0	reg_txfsm_4us_delay_7_0
23	0	reg_softreset_enable
22	1	cri_rxeb_eiosenable
21	1	cri_rxdigfiltsq_enable
20	0	reg_txfsm_delay_ovrd
19:16	0 0 0 0	reg_txfsm_4us_delay_11_8
15:14	0 0	reg_pclk_rate_1_0
13:12	0 0	reg_rate_1_0
11:9	0 0 0	reg_phymode_2_0
8	0	reg_modeovren
7:6	0 1	reg_datawidth
5	1	soft_reset_n
4	0	reg_diginelben
3	0	reg_digifelben
2	0	reg_strapgroup_ovrden
1	0	reg_yank_timer_done_b_ovrd
0	0	reg_yank_timer_done_b_ovrd_en

Bit Range	Default & Access	Description
31:24	0h RW	**reg_txfsm_4us_delay_7_0:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
23	0h RW	**reg_softreset_enable:** When '1' the soft_reset_n bit will contol the lane reset When '0' the hardware reset will control the lane reset Note for DP: In addition to soft_reset_n,which will reset both TX0 and TX 1 in the lane, the reg_tx1_soft_reset_n bit can be used to reset only TX1 in the lane and reg_tx2_soft_reset_n bit can be used to reset only TX2
22	1h RW	**cri_rxeb_eiosenable:** When 1 enables EIOS based Rx power down

Bit Range	Default & Access	Description
21	1h RW	**cri_rxdigfiltsq_enable:** When 1 enables unsquelch based Rx power up in P0 or P0s
20	0h RW	**reg_txfsm_delay_ovrd:** Override enable bit for reg_txfsm_4us_delay
19:16	0h RW	**reg_txfsm_4us_delay_11_8:** Override counter value for 4 us delay in txfsm lane reset to txbiasen delay
15:14	0h RW	**reg_pclk_rate_1_0:** Override for pclk_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
13:12	0h RW	**reg_rate_1_0:** Override for i_rate 00 = gen1 01 = gen2 10 = gen3 11 = GbE
11:9	0h RW	**reg_phymode_2_0:** Override for PHY Mode Selection 000 = PCIE 001 = USB3 010 = GbE 011 = SATA/SAPIS 100 = Display 101 = DMI 110 = CIO 111 =Reserved
8	0h RW	**reg_modeovren:** When asserted selects register override bits for phymode, datawidth etc
7:6	1h RW	**reg_datawidth:** Override for Tx data interface width. 00 - Unused 01 - x8/x10 width (default) 10 - x16/x20 width 11 - x32/x40 width
5	1h RW	**soft_reset_n:** Active low soft reset override
4	0h RW	**reg_diginelben:** Override for near end digital loopback.
3	0h RW	**reg_digifelben:** Override for far end digital loopback
2	0h RW	**reg_strapgroup_ovrden:** Override Enable for Strap Group
1	0h RW	**reg_yank_timer_done_b_ovrd:** Override for yank_timer_done_b
0	0h RW	**reg_yank_timer_done_b_ovrd_en:** Override Enable for yank_timer_done_b

17.19.3 PCS_DWORD2 (pcs_dword2)—Offset 8h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword2: [Port: 0xA3] + (2400h + 8h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Field
31:28	reg_rxpwrfsm_pibiasoff_delay_3_0
27:24	cri_sqdbexittimer_override_3_0
23:18	cri_sqdbentrytimer_override_5_0
17:16	reg_rxdrcgtsqsel_1_0
15	cri_reut_SlaveSideDataCheckingEn
14	cri_sqdbtimer_ovren
13	cri_rxpwrfsm_timer_ovren
12	reg_rxidle
11	cri_rxrawdata_sel
10	cri_dynkalign_eco3302703_mode
9	cri_dynkalign_eco3302703_ovren
8	reg_rxpwrfsm_pibiasoff_ovrride
7	cri_reset_kalignlck
6	cri_ebptrrst
5	cri_comdispfix
4	cri_forcebankhit
3:2	cri_kalignmode_1_0
1	cri_skpprocdis
0	cri_elasticbuffer_maskdis

Bit Range	Default & Access	Description
31:28	0h RW	**reg_rxpwrfsm_pibiasoff_delay_3_0:** Override value for delay (in 2ns increments) between deassertion of opianclkbufen and opibiasen
27:24	0h RW	**cri_sqdbexittimer_override_3_0:** Rx squelch exit debounce timer
23:18	0h RW	**cri_sqdbentrytimer_override_5_0:** Rx squelch entry debounce timer
17:16	0h RW	**reg_rxdrcgtsqsel_1_0:** Squelch output select
15	0h RW	**cri_reut_SlaveSideDataCheckingEn:** Enable REUT slave side checking while in loopback slave
14	0h RW	**cri_sqdbtimer_ovren:** Squelch debounce timer override enable
13	0h RW	**cri_rxpwrfsm_timer_ovren:** Rx power management fsm timer override enable
12	0h RW	**reg_rxidle:** Chicken bit to override i_rxidle from controller and keep Rx in P0 or P0s
11	0h RW	**cri_rxrawdata_sel:** When asserted bypass K-align, 10b/8b decoder and Elastic buffer
10	0h RW	**cri_dynkalign_eco3302703_mode:** Kalign Mode Override Value When cri_dynkalign_eco3302703_ovren is set, this value selects kalignmode 0 - use register bits cri_kalignmode[1:0] to select kalignmode 1 - select the 4 COM kalign mode'
9	0h RW	**cri_dynkalign_eco3302703_ovren:** Kalign Mode Override Enable Overrides kalign mode select pin, allowing config bit kalignmode_override_val to select kalignmode.
8	0h RW	**reg_rxpwrfsm_pibiasoff_ovrride:** When asserted selects reg_rxpwrfsm_pibiasoff_delay[3:0]
7	0h RW	**cri_reset_kalignlck:** When asserted resets Kalign lock indication and Kalign is performed again. The conditions when this would assert includes and is not restricted to any power management states (L0s, L1) or polling quiet states etc.
6	0h RW	**cri_ebptrrst:** Global broadcast to all lanes that the Elastic Buffer pointers should be reset. This is a pulse and will be generated when we need to reset the pointers because of collision or various other reasons.
5	0h RW	**cri_comdispfix:** Chicken bit to force disparity in dynamic K-align mode

Bit Range	Default & Access	Description
4	0h RW	**cri_forcebankhit:** Chicken bit to enable data appear on NOA post k-align lock although k-align block is not achieving lock. This is only for NOA observeability and not for other purpose
3:2	0h RW	**cri_kalignmode_1_0:** KALIGN Mode Select 00 = dynamic kalign all the time. Accounts for bit slips on incoming stream which can cause symbol to be detected on different bank 10 = dynamic kalign up to L0 x1 = static kalign (same as GDG). Assumes symbol always detected on same data bank
1	0h RW	**cri_skpprocdis:** SKIP Ordered-Set Processing Disable When this configuration bit is asserted, then SKIP ordered=sets will be ignored (in EB block). Used in Elastic buffer block. 0 = Normal operation. SKIP ordered=sets will be processed by the Elastic Buffer 1 = SKIP processing disabled.
0	0h RW	**cri_elasticbuffer_maskdis:** Config bit (chicken bit) to disable the masking logic after elec idle ordered set is seen

17.19.4 PCS_DWORD3 (pcs_dword3)—Offset Ch

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword3: [Port: 0xA3] + (2400h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 5515ACAAh

Bit Range	Default & Access	Description
31:24	57h RW	**cri_dfx_patbuf_23_16:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
23:16	55h RW	**cri_dfx_patbuf_31_24:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
15:8	55h RW	**cri_dfx_patbuf_39_32:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.
7:0	C1h RW	**cri_dfx_patbuf_47_40:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.19.6 PCS_DWORD5 (pcs_dword5)—Offset 14h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword5: [Port: 0xA3] + (2400h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00003E63h

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 1 1	1 1 1 0	0 1 1 0	0 0 1 1

31	30:28	27:26	25	24	23	22	21	20	19	18	17	16	15:8	7:0
cri_dfx_patbuftrain	cri_dfx_prbspoly_2_0	cri_dfx_patbufsize_1_0	cri_dfx_patbufloop	cri_dfx_patbufdwidth	cri_dfx_patbuftrainovr	cri_dfx_marginmode	cri_dfx_chk_sel	cri_dfx_patchken	cri_dfx_patgenen	cri_dfx_clrerrcnt	cri_dfx_lcereset	cri_dfx_lcestart	cri_dfx_patbuf_7_0	cri_dfx_patbuf_15_8

Bit Range	Default & Access	Description
31	0h RW	**cri_dfx_patbuftrain:** Pattern Buffer Manual Training When DFXPATBUFTRAINOVR and DFXLCESTART are asserted, this manually controls whether the Pattern Buffers are in training or have completed training. 0 : Send training patterns (default) 1 : Send contents of DFXPATBUF
30:28	0h RW	**cri_dfx_prbspoly_2_0:** PRBS Polynomial Select the polynomial to be used by the PRBS in the Pattern Generator and Pattern Checker. PRBS support 10b or 8b, which is indicated by the msb. 000 - x^16 + x^5 + x^4 + x^3 + 1 (USB3/PCIe Scrambler) (8b) 001 - x^16 + x^15 + x^13 + x^4 + 1 (SATA scrambler) (8b) 010 - x^31 + x^28 + 1 (8b) 011 - x^7 + x^6 + 1 (8b) 100 - x^15 + x^14 + 1 (10b) 101 - x^23 + x^18 + 1 (10b) 110 - x^31 + x^28 + 1 (10b) 111 - x^7 + x^6 + 1 (10b)
27:26	0h RW	**cri_dfx_patbufsize_1_0:** Pattern Buffer Size Select the size of the Pattern Buffer to use. The MSB will always be bit 79. The LSB will depend on this select and the DFXLCEDATAWIDTH (10b or 8b mode). 00 : full 80b buffer (Default) 01 : 70b (while in 10b mode), 56b (while in 8b mode) 10 : 40b (while in 10b mode), 32b (while in 8b mode) 11 : 10b (while in 10b mode), 8b (while in 8b mode)
25	0h RW	**cri_dfx_patbufloop:** Pattern Buffer Looping Enable Enables looping of the Patter Buffer. By default, the contents of Pattern Buffer will be used once and stop. Alternatively, the Pattern Buffer will continue to loop until the DFXLCESTART is de-asserted. 0 : Run Pattern Buffer only once (default) 1 : Loop Pattern Buffer until stopped
24	0h RW	**cri_dfx_patbufdwidth:** Pattern Buffer Data Width Selects between 10 bit or 8 bit data width for the Pattern Buffer. Determines where in the Tx/Rx path the data is inserted/ retrieved. 0 : 10b (default) 1 : 8b
23	0h RW	**cri_dfx_patbuftrainovr:** Pattern Buffer Training Override Enables manual training of the Pattern Buffer instead of the automated coordination between the Pattern Checker and Patter Generator. When asserted, the DFXPATBUFTRAIN bit will be used to force when training is active and when it is complete. 0 : Automatic Training (default) 1 : Enable Manual Training
22	0h RW	**cri_dfx_marginmode:** Margin mode Overrides standard setup configurations for use with Eye Width Margining. 0 : Standard Mode (default) 1 : Margin Mode enabled
21	0h RW	**cri_dfx_chk_sel:** Pattern Checker 8b10b Select This determines where Rx data is compared, either in the 10-bit domain before decode or after 10b-)8b decoding. 0: 10b domain 1: 8b domain
20	0h RW	**cri_dfx_patchken:** Pattern Checker Enable 0 : Disable Pattern Checker (default) 1 : Enable Pattern Checker
19	0h RW	**cri_dfx_patgenen:** Pattern Generator Enable This will activate the DFx bypass muxes in the PCS Tx path. 0 : Disable Pattern Generator (default) 1 : Enable Pattern Generator
18	0h RW	**cri_dfx_clrerrcnt:** Clear Error Counter Resets the Pattern Checker's error counter. 0 : Error Counter allowed to run (default) 1 : Error Counter held in reset
17	0h RW	**cri_dfx_lcereset:** Local Compare Engine Reset Resets all components of the Local Compare Engine in both the Pattern Generator and the Pattern Checker. 0 : LCE not in reset (default) 1 : LCE in reset
16	0h RW	**cri_dfx_lcestart:** Local Compare Engine Start Controls the starting and stopping of the LCE. Allows for simultaneous or independent start across lanes. Once stopped, a DFXLCERESET is usually required. 0 : LCE stopped (default) 1 : LCE running
15:8	3Eh RW	**cri_dfx_patbuf_7_0:** Pattern Buffer Storage In 10b mode, the buffer is read as eight 10b chunks. The first 10 bits should not equal the Comma Symbol: '0011111010' (or its inversion '1100000101'). In 8b mode, the buffer is read as eight 10b chunks, where the 10th bit is unused and the 9th bit is the K-bit indicator. The first 10 bits should not equal the Comma Symbol: 'xx10111100'. DFXPATBUF[78] should not = '1'.
7:0	63h RW	**cri_dfx_patbuf_15_8:** Pattern Buffer Storage See cri_dfx_patbuf[7:0] description.

17.19.7 PCS_DWORD6 (pcs_dword6)—Offset 18h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword6: [Port: 0xA3] + (2400h + 18h)

Op Codes:
0h - Read, 1h - Write

Default: FFFFFFFFh

Bits	31:24	23:16	15:8	7:0
Default	1 1 1 1 1 1 1 1	1 1 1 1 1 1 1 1	1 1 1 1 1 1 1 1	1 1 1 1 1 1 1 1
Field	cri_dfx_prbsseed_7_0	cri_dfx_prbsseed_15_8	cri_dfx_prbsseed_23_16	cri_dfx_prbsseed_31_24

Bit Range	Default & Access	Description
31:24	FFh RW	**cri_dfx_prbsseed_7_0:** PRBS Seed Can be used for HVM determinism. The use of all zeroes can result in lockup.
23:16	FFh RW	**cri_dfx_prbsseed_15_8:** PRBS Seed See cri_dfx_prbsseed[7:0] description.
15:8	FFh RW	**cri_dfx_prbsseed_23_16:** PRBS Seed See cri_dfx_prbsseed[7:0] description.

17.19.8 PCS_DWORD7 (pcs_dword7)—Offset 1Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword7: [Port: 0xA3] + (2400h + 1Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00000009h

Bits	Default	Field
31:24	0 0 0 0 0 0 0 0	dfx_cri_errcnt_7_0
23:16	0 0 0 0 0 0 0 0	dfx_cri_errcnt_15_8
15	0	i_rxcaldone
14	0	dfx_cri_lcemgnerr
13	0	cri_dfx_patgen2active
12	0	dfx_cri_patbufallfail
11	0	dfx_cri_patchkactive
10	0	dfx_cri_patgenactive
9	0	dfx_cri_lcetraindone
8	0	dfx_cri_lcetrainactive
7	0	reserved501
6	0	cri_dfx_patgen2en
5:4	0 0	cri_dfx_maxerrcnt_1_0
3:0	1 0 0 1	cri_dfx_prbstraincnt_3_0

Bit Range	Default & Access	Description
31:24	X RO	**dfx_cri_errcnt_7_0:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
23:16	X RO	**dfx_cri_errcnt_15_8:** Error Counter Tracks how many bit errors the Pattern Checker has detected. Can be cleared using DFXCLRERRCNT or DFXLCERESET.
15	X RO	**i_rxcaldone:** RX Calibration Cycles Complete Indicator
14	X RO	**dfx_cri_lcemgnerr:** Local Compare Engine Margin Error Indicates that the error counter has reached its max value. This can be used by the Rx upartition during Margin Mode to determine when the eye width has closed.
13	X RO	**cri_dfx_patgen2active:** Pattern Generator 2 Active status indicator In a lane with two Tx paths, this indicates that the second Pattern Generator is in progress. The DFXPATGENACTIVE will only indicate that the first Pattern Generator is in progress.
12	X RO	**dfx_cri_patbufallfail:** Pattern Buffer All Fail status indicator Indicates that there has not been a single matching Pattern Buffer pattern. This could signify that an error occured during training.
11	X RO	**dfx_cri_patchkactive:** Pattern Checker Active status indicator Indicates that the Pattern Checker is in progress (either Pattern Buffer or PRBS).
10	X RO	**dfx_cri_patgenactive:** Pattern Generator Active status indicator Indicates that the Pattern Generator is in progress (either Pattern Buffer or PRBS).
9	X RO	**dfx_cri_lcetraindone:** Local Compare Engine Training Done status indicator Indicates that the Pattern Checker training is completed (either Pattern Buffer or PRBS). The Pattern Checker is now synchronized to the Pattern Generator.
8	X RO	**dfx_cri_lcetrainactive:** Local Compare Engine Training Active status indicator Indicates that the Pattern Checker training is in progress (either Pattern Buffer or PRBS).
7	0h RW	**reserved501:** reserved
6	0h RW	**cri_dfx_patgen2en:** Pattern Generator 2 Enable In a lane with two Tx paths, this enables the second Pattern Generator. The DFXPATGENEN will enable the first Pattern Generator. 0 : Disable second Pattern Generator (default) 1 : Enable second Pattern Generator
5:4	0h RW	**cri_dfx_maxerrcnt_1_0:** Maximum Error Count Selectable maximum value that the DFXERRCNT can reach before the Local Compare Engine is automatically stopped. 00 : 2^16 (default) 01 : 2^10 10 : 2^8 11 : 2^4
3:0	9h RW	**cri_dfx_prbstraincnt_3_0:** PRBS Training Count The number of consecutive cycles that the Pattern Checker's PRBS must be error free before it is considered synchronized. Default is 9.

17.19.9 PCS_DWORD8 (pcs_dword8)—Offset 20h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword8: [Port: 0xA3] + (2400h + 20h)

Op Codes:
0h - Read, 1h - Write

Default: 000000C4h

2	0	cri_tx1highpowerei_ovrdval
1	0	cri_tx2highpowerei_ovrdval
0	1	p2_fast_exit_en

Bit Range	Default & Access	Description
31	0h RW	**squelch_shunt_ovrd_en:** Squelch Shunt Pulse Duration Override Enable Overrides the hardware default shunt pulse duration value 1: Shunt Pulse Duration Override Enable 0: Shunt Pulse Duration Override Disable
30:28	0h RW	**squelch_shunt_cnt_2_0:** Squelch Shunt Pulse Duration Override Value 000 = No shunt pulse generated 001 = 1 susclk cycles ... 111 = 7 susclk cycles
27	0h RW	**reserved520:** reserved
26	0h RW	**i_rxsqfsm_timersel:** Squelch FSM Timer Select 0 - Selects 25Mhz values for squelch timer and shunt pulse generation . 1 - Selects 100Mhz values for squelch timer and shunt pulse generation. This register is applicable to synchronous squelch startup mode.
25	0h RW	**i_rxsq_asyncmode_h:** Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualfiy it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered.
24	1h RW	**i_rxsquelchstby_h:** Fast Squelch Enable Mode Bit to keep the IREF (ivrefen) on during P2 and reduce squelch startup time.

Bit Range	Default & Access	Description
23:18	0h RW	**reserved519:** reserved
17:16	0h RW	**cri_dfx_evenoddmask_1_0:** Pattern Checker Even/Odd Bit Error Mask Select 00 : no masking; all errors will be counted 01: select odd path, mask even path; only errors on bits [1,3,5,7,9] are counted 10: select even path, mask odd path; only errors on bits [0,2,4,6,8] are counted 11: reserved;
15:12	0h RW	**reserved518:** reserved
11:10	0h RW	**cri_dfx_lce2patsrc_1_0:** Local Compare Engine 2 Pattern Source In a lane with two Tx paths, this selects between using Pattern Buffer or PRBS as source of LCE patterns for the second LCE. The DFXLCEPATSRC selects for the first LCE. 0 : Pattern Buffer (default) 1 : PRBS
9:8	0h RW	**cri_dfx_lcepatsrc_1_0:** Local Compare Engine Pattern Source. Selects between using Pattern Buffer or PRBS as source of LCE patterns. 00 : Pattern Buffer; use LCE default training pattern; 01: Pattern Buffer; use the first 40b of pattern buffer for training. 10: PRBS; use LCE default training pattern; 11: PRBS; use the first 40b of pattern buffer for training.
7:6	0h RW	**reserved517:** reserved
5:4	0h RW	**txloadgen_ctr_val:** TxLoadGen Pulse Width Control Controls the pulse width of txloadgenen from PCS to Tx upar. This is used in MAC inititated digital far end loopback mode in PCIE family. 00 - txloadgenen pulse width is 4 symbol clocks (default) 01- txloadgenen pulse width is 2 symbol clocks 10 - txloadgenen pulse not generated 11 - txloadgenen pulse width is 6 symbol clocks
3	0h RW	**cri_txhighpowerei_ovrden:** TxHighPowerEI Override Mode Enable 0 - TxHighPowerEI to TxuPAR driven by Logic 1 - TxHighPowerEI to TxuPAR driven by override register value(s).
2	0h RW	**cri_tx1highpowerei_ovrdval:** Tx1HighPowerEI Override Value Valid when cri_txhighpowerei_ovrden = 1'b1. 0 - Tx1HighPowerEI disabled 1 - Tx1HighPowerEI enabled
1	0h RW	**cri_tx2highpowerei_ovrdval:** Tx2HighPowerEI Override Value Valid when cri_txhighpowerei_ovrden = 1'b1. 0 - Tx2HighPowerEI disabled 1 - Tx2HighPowerEI enabled
0	1h RW	**p2_fast_exit_en:** P2 Fast Exit Mode Enable Common Mode sustainer will be enabled during P2 when this bit is asserted. 1: P2 Fast Exit Mode Enable 0: P2 Fast Exit Mode Disable

17.19.18 PCS_DWORD17 (pcs_dword17)—Offset 44h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword17: [Port: 0xA3] + (2400h + 44h)

Op Codes:

Bit Range	Default & Access	Description
31:30	0h RW	**oirefdfxsel_1_0:** IREF Voltage Monitor Select Selects voltage to monitor within the IREF block. 00 - vref 01 - pgate 10 - vbc 11 - vref loop
29	0h RW	**iopampsfpen_h:** (NOT USED - noconned)
28	0h RW	**iopampsfnen_h:** (NOT USED - noconned)
27	0h RW	**iopamppen_h:** DC Monitor Unity-Gain Buffer Enable 0: disable (default) 1: enable
26	0h RW	**iopampnen_h:** (NOT USED - noconned)
25	0h RW	**monanapgen:** DC Monitor to Monitor Port Enable Enables DC monitor passgate to monitor port via analog observability abutment.
24	1h RW	**monubufbypassen:** DC Monitor Unity-Gain Buffer Bypass 0: no bypass 1: bypass (default - required for LRC)
23:22	0h RW	**reserved522:** reserved
21	0h RW	**reg_ivrefen:** IvrefEn Override Value Register is valid when override mode is enabled (ivrefen_ovrd). During this mode, this register will have direct control to enable/disable the ivref opamp. 0 - Disable ivref opamp 1 - Enable ivref opamp
20	0h RW	**ivrefen_ovrd:** IvrefEn Override Select 0 - the enable for the ivref opamp (ivrefen) is driven by the FSM. 1 - the ivrefen is driven by the register (reg_ivrefen).
19:17	0h RW	**reserved523:** reserved
16	0h RW	**oirefcurmonsel:** IREF Current Monitor Select Enables current mirror from the IREF block to the 'shared' analog monitor port.
15	0h RW	**lrcdisable:** LRC Disable This bit disables the LRC. Any token received is passed to the next lane.
14:12	0h RW	**reserved521:** reserved
11	0h RW	**lrc_rdy_pulsegen:** LRC Ready PulseGen Generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal to all four targets; does not recompute local Rcomp code. Values in DWD 0x14 (*rccodes[7:0]) will be latched into targets. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overriden.
10:9	0h RW	**lrc_rdy_target_1_0:** LRC Ready Pulse Target Indicates which lrc target to recompute when lrc_rdy_ovd is strobed 00: irefrccode 01: txrccode 10: rxtermrccode 11: rxvgarccode

Bit Range	Default & Access	Description
8	0h RW	**lrc_rdy_ovd:** LRC Ready Override Recomputes the selected local rcomp code and generates a pulse 1 cal_clk cycle wide on the lrc_rdy signal that is selected in bits [2:1]. User must clear this bit before generating another pulse. Note: User should disable PM and PER. FSM can take control and codes can be overriden.
7	0h RW	**rxtermpmrcen:** PM RCOMP Enable for Rx Termination 1 - Enables the RCOMP update to occur while RX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
6	0h RW	**rxvgapmrcen:** PM RCOMP Enable for Rx VGA (Same description as the RxTerm PM Rcomp Enable.)
5	0h RW	**txpmrcen:** PM RCOMP Enable for Tx 1 - Enables the RCOMP update to occur while TX is in power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
4	0h RW	**irefpmrcen:** IREF PM RCOMP Enable 1 - Enables the RCOMP update to occur while TX/RX is in the P1 or P2 (partial or slumber) power management state if periodic RCOMP is enabled. If this bit is set and the PHY is not in a power management state, no update will occur. 0 - Disables power management qualifier to the RCOMP update; therefore RCOMP updates will be based on the state of the target periodic bit.
3	0h RW	**rxtermperrcen:** Periodic RCOMP Enable for Rx Termination 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
2	0h RW	**rxvgaperrcen:** Periodic RCOMP Enable for Rx VGA 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
1	0h RW	**txperrcen:** Periodic RCOMP Enable for Tx 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.
0	1h RW	**irefperrcen:** Periodic RCOMP Enable for Iref 1 - Enables the periodic RCOMP update for specified block. 0 - Disables periodic RCOMP update for specified block.

17.19.19 PCS_DWORD18 (pcs_dword18)—Offset 48h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword18: [Port: 0xA3] + (2400h + 48h)

Op Codes:
0h - Read, 1h - Write

Default: 00008080h

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Range	Default & Access	Description
31:24	0h RW	**iamp0calcode_7_0:** IREF Opamp Calibration Codes These bits are written by the calibration state machine. Bit7 - Calibration enable that configures the target into a calibration mode Bit6 - Calibration sign bit Bit[5:0] - Calibration magnitude [lyonel to check bit7 functionality].
23:20	0h RW	**cal_num:** Calibration Number or Address numbers of cal targets or address for specific cal target if cal_type = 1
19	0h RW	**cal_start:** Calibration Start This bit is used to start a Cal cycle vias IOSF-SB. The cal cycle will follow the normal cal cycle as set by cal_num, cal_type, cal_inv and cal_rst. The Cal cycle starts when this bit transitions 0 1 1 = Run Cal. 0 = wait (default)
18	0h RW	**cal_type:** Calibration Type Enable calibration of one cal target defined by cal_num 0 = multi 1 = single

Bit Range	Default & Access	Description
17	0h RW	**cal_inv:** Calibration Feedback Invert Inverse the logic of counter increment decrement depends on the FB
16	0h RW	**cal_rst:** Calibration Reset Reset state machine
15:14	1h RW	**calclkdivsel_1_0:** Calibration Clock Divider Select 00 - div2 of CRICLK 01 - div4 of CRICLK 10 - div8 of CRICLK 11 - div16 of CRICLK Note: Calibration clock period target is 160nS
13	0h RO	**reserved525:** reserved
12	0h RO	**calib_done:** Calibration Completion Indicator
11:8	Fh RW	**cal_fb_count:** Calibration Cycle Count Limit per target Each calibration target is clocked for 16 * cal_fb_count clock cycles. Max is 240 clock cycles (default)
7:6	0h RW	**adc_acctime_1_0:** ADC Accumulation Time Select This selects the conversion time for the Analog to Digital Converter. ADC clock frequency is set by bits [5:4] in this register. 00: 1024 ADC clocks (default) 01: 512 ADC clocks 10: 256 ADC clocks 11: Infinite (ADC in continuous accumulation) Note: If LRC mode and set to '11', then adctime = 1024cycles.
5:4	1h RW	**adc_clksel_1_0:** ADC Clock Frequency Select This selects the input clock frequency to the Analog to Digital Converter. 00: CRI clock div2 01: CRI clock div1 10: CRI clock div4 11: CRI clock div8 NOTE: Target is 50Mhz.
3:1	0h RW	**adcmuxsel_2_0:** ADC Analog Mux Select This selects the analog voltage input to the Analog to Digital Converter. 000: Vss 001: Vcc 010: LRC R1 voltage divider 011: LRC sense net 100: input from Tx 101: input from Rx (or Tx #2) 110: input from Clock 111: input from reference generator Note: Mux select is controlled by the FSM during LRC.
0	0h RW	**adcstart:** ADC start This bit resets the ADC counter and starts a new acquisition. This bit should remain 1'b1 while the ADC is active and acquiring data. 0: Disable ADC logic and analog circuitry 1: Enable ADC and start A2D conversion.

17.19.21 PCS_DWORD20 (pcs_dword20)—Offset 50h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword20: [Port: 0xA3] + (2400h + 50h)

Op Codes:
0h - Read, 1h - Write

Default: 80808080h

17.19.23 PCS_DWORD22 (pcs_dword22)—Offset 58h

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword22: [Port: 0xA3] + (2400h + 58h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h

31:24	23:16	15:8	7:0
0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0
rxvgarcoffset_7_0	rxtermrcoffset_7_0	txrcoffset_7_0	irefrcoffset_7_0

Bit Range	Default & Access	Description
31:24	0h RW	**rxvgarcoffset_7_0:** Rx VGA Rcomp Offset Same description as IREF Rcomp Offset, but applies to RxVGA Rcomp.
23:16	0h RW	**rxtermrcoffset_7_0:** Rx Termination Rcomp Offset Same description as IREF Rcomp Offset, but applies to RxTerm Rcomp.
15:8	0h RW	**txrcoffset_7_0:** Tx Rcomp Offset Same description as IREF Rcomp Offset, but applies to Tx Rcomp.
7:0	0h RW	**irefrcoffset_7_0:** Iref Rcomp Offset This value is added to the scaled LRC code to determine the final calibration code used by the Iref block. 2's complement format. The full 8-bit offset is used with the scale multiplier to determine the final 8-bit value, but the Iref target only uses the upper MSBs of the final value. 0x00: Offset = 0 0x01: Offset = +1 0x7F: Offset = +127 0xFF: Offset = -1 0x80: Offset = -128 Note: The final rcomp code has rollover protection so the final rcomp code + offset will not exceed the min/max range.

17.19.24 PCS_DWORD23 (pcs_dword23)—Offset 5Ch

Access Method

Type: Message Bus Register (Size: 32 bits)

pcs_dword23: [Port: 0xA3] + (2400h + 5Ch)

Op Codes:
0h - Read, 1h - Write

Default: 00180888h

31:24	23	22:19	18:16	15:12	11:8	7:4	3:0
0 0 0 0 0 0 0 0	0	0 0 1 1	0 0 0	0 0 0 0	1 0 0 0	1 0 0 0	1 0 0 0

Bit Range	Default & Access	Description
31:24	0h RW	**iclkqcfg_spare_7_0:** (Bonus bits for Data Lane Clk Distrubtion block)
23	0h RW	**iclkicfg_spare_7:** Repurposed for IREF backup mode in DL Select bit to enable diode based IREF in DL 0 - functional mode, use IREFGEN loop output 1 - bypass IREF loop, use diode connected PMOS output Ensure IREF loop amp is enabled by forcing reg_ivrefen and ivrefen_ovrd to 1
22:19	3h RW	**iclkicfg_spare_6_3:** TX MUX tail current strength setting
18:16	0h RW	**iclkicfg_spare_2_0:** CLK Distribution Monitor MUX Select
15:12	0h RW	**reserved526:** reserved
11:8	8h RW	**i_drvcfg_3_0:** CLK: Driver Tail Current Control
7:4	8h RW	**i_ploadcfg_3_0:** CLK: Pbias Ref Current Selection
3:0	8h RW	**ipbiasctrl_3_0:** CLK: Pmos-Load Pbias Voltage Control

17.19.25 PCS_DWORD24 (pcs_dword24)—Offset 60h

Access Method

Type: Message Bus Register
(Size: 32 bits)

pcs_dword24: [Port: 0xA3] + (2400h + 60h)

Op Codes:
0h - Read, 1h - Write

Default: 0001C020h

31:24	23:17	16	15	14:10	9:8	7	6:0
0 0 0 0 0 0 0 0	0 0 0 0 0 0 0	1	1	1 0 0 0 0	0 0	0	0 1 0 0 0 0 0
reserved528	reserved527	cri_lanereset_clkgatectl	cri_lanereqforce	cri_susclkdisable_delay_4_0	cri_data_dynclkgate_mode_1_0	cri_eios_waittime_ovren	cri_eios_waittime_6_0

Bit Range	Default & Access	Description
31:24	0h RW	**reserved528:** reserved
23:17	0h RW	**reserved527:** reserved

Bit Range	Default & Access	Description
16	1h RW	**cri_lanereset_clkgatectl:** 1: The assertion of lane reset will have the effect of gating the susclk and de-asserting the internal laneclkreq. This mode is only valid when the data lane dynamic clock gating mode is set to a non-zero value (i.e. 01, 10, and 11). 0: The assertion of lane reset will have no effect on the gating of susclk and state of the internal laneclkreq signal.
15	1h RW	**cri_lanereqforce:** Controls whether the internal laneclkreq will be forced to 1 or 0 when cfg_data_dynclkgate_mode is set to 00 or 10. 1: force laneclkreq high 0: force laneclkreq low. This mode will likely be used when one of the lanes is disabled while other lanes in the family are enabled. In this case the internal laneclkreq of the disabled lane should be de-asserted (not influencing the clk gating decision)
14:10	10h RW	**cri_susclkdisable_delay_4_0:** This register will control the number of cycles to delay the susclk enable de-assertion, in addition to the de-assertion of the laneclkreq signal sent out of the datalane. The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay .... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay
9:8	0h RW	**cri_data_dynclkgate_mode_1_0:** Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal.
7	0h RW	**cri_eios_waittime_ovren:** EIOS Wait Time Override Enable for Rx Turn OFF 0: hardware value for EIOS wait timer is selected. 1: selects cri_eios_waittime[6:0]
6:0	20h RW	**cri_eios_waittime_6_0:** EIOS Wait Time for Rx Turn OFF Represents override value timer in PCS that comes into play during EIOS based turn off Rx (Rx L0s) 0000000 - Timer is bypassed 0000001 - 1 PLL link clock period delay (2ns) 0000010 - 2 PLL link clock period delay (4ns) ... 0100000 - 32 PLL link clock periods delay (64ns) - default

Bit Range	Default & Access	Description
31:24	55h RW	**omargin010_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~2/3Vp2p
23:16	80h RW	**omargin000_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p. To be used in Gen2 mode (Gen1/Gen2 depend on dataratefit and downscaleamp register)
15:8	98h RW	**ouniqtranscale_7_0:** scales the number of slices defined the ref circuit (or R-comp circuit) by factor of ouniqtranscale[7:0]/128 The scaled amount of slices might be used in the full-swing Uis according to ouniqetrangenmethod[1:0] The scaled amount of slices might be used in the full-swing Uis according to oscaledcompmethod[1:0]
7	0h RO	**reserved511:** reserved
6:0	3Ah RW	**ofrcslices_6_0:** number of used slices if forced Used in compensated GPIO mode

17.20.4 TX_DWORD3 (tx_dword3)—Offset Ch

Access Method

Type: Message Bus Register
(Size: 32 bits)

tx_dword3: [Port: 0xA3] + (2480h + Ch)

Op Codes:
0h - Read, 1h - Write

Default: 0C782040h

Bit	31	30	29:28	27:26	25	24	23:16	15:8	7:0
Default	0	0	0 0	1 1	0	0	0 1 1 1 1 0 0 0	0 0 1 0 0 0 0 0	0 1 0 0 0 0 0 0
Field	opisorate8b_h	obeacondivratio	ouniqetrangenmethod_1_0	oscaledcompmethod_1_0	odeemswinggenmethod	odownscaleampmethod	omargin101_7_0	omargin100_7_0	omargin011_7_0

Bit Range	Default & Access	Description
31	0h RW	**opisorate8b_h:** if '0' the PISO is of 10 bits (the whole bus) if '1' the PISO is of 8 bits (The LSBs) It's relevant both in normal Tx and in loopback mode. Use: '1' in PCI-E gen 3 and CIO (if supported) '0' for all other interfaces
30	0h RW	**obeacondivratio:** Div ration of beacon signal from ick_suslow clock '0' - Beacon freq will be as sus clock freq '1' - Beacon freq will be 1/4 of sus clock freq (note LFPS spec is 10-50MHz)
29:28	0h RW	**ouniqetrangenmethod_1_0:** Used to define if we use uniq-transition-bit scaling or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't activate uniq-transition-bit When '01' - if fast-clock is not divided (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. When '10' - if fast-clock is not divided or divided by 2 (gen2?) activate uniq-transition-bit otherwise (gen1?) don't. (will probably be down-scaling amount of slices) When '11' - activate uniq-transition-bit
27:26	3h RW	**oscaledcompmethod_1_0:** Used to define if we use scaling of the compansation values or not. The purpose is to have gen dependant scaling / non-scaling When '00' - don't used scaled comp When '01' - if fast-clock is not divided (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp When '10' - if fast-clock is not divided or divided by 2 (gen2?) don't scale-comp otherwise (gen1?) use scaled-comp (will probably be down-scaling amount of slices) When '11' - if fast-clock is not divided (gen2?) use scaled-comp otherwise (gen1?) don't use scaled-comp (will probably be up-scaling amount of slices)
25	0h RW	**odeemswinggenmethod:** Used to select scaling of -3.5dB deemphasis either ow2tapgen1deemph3p5[7:0] or ow2tapgen2deemph3p5[7:0] When '0' - if fast-clock is not divided use gen2 otherwise use gen1 When '1' - if fast-clock is not divided or divided by 2 use gen2 otherwise use gen1
24	0h RW	**odownscaleampmethod:** when margin='001', this bit with dataratefit are used to select between margin000 (for gen2) and margin101 (for gen1) when '0' - if fast-clock is not divided use margin000 (gen2) otherwise use margin101 (gen1) when '1' - if fast-clock is not divided or divided by 2 use margin000 (gen2) otherwise use margin101 (gen1)
23:16	78h RW	**omargin101_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1V p2p to be used in Gen1 mode (Gen1/Gen2 depends on dataratefit and downscaleamp register)
15:8	20h RW	**omargin100_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/4Vp2p
7:0	40h RW	**omargin011_7_0:** factor (X/128) of slices to use in main-R1 for full swing level. Used for ~1/2Vp2p

17.20.5 TX_DWORD4 (tx_dword4)—Offset 10h

Access Method

Type: Message Bus Register (Size: 32 bits)	**tx_dword4:** [Port: 0xA3] + (2480h + 10h)

Op Codes:
0h - Read, 1h - Write

Default: 2B404D55h

31:24	23:16	15:8	7:0
0 0 1 0 1 0 1 1	0 1 0 0 0 0 0 0	0 1 0 0 1 1 0 1	0 1 0 1 0 1 0 1
ow2tapdeemph9p5_7_0	ow2tapdeemph6p0_7_0	ow2tapgen2deemph3p5_7_0	ow2tapgen1deemph3p5_7_0

Bit Range	Default & Access	Description
31:24	2Bh RW	**ow2tapdeemph9p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 9.5dB deemphais
23:16	40h RW	**ow2tapdeemph6p0_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 6.0dB deemphais
15:8	4Dh RW	**ow2tapgen2deemph3p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 3.5dB deemphais
7:0	55h RW	**ow2tapgen1deemph3p5_7_0:** factor (X/128) of slices to use in main-R1 out of the slices in main-R1 in full-swing. Normally - in order to have 3.5dB deemphais

17.20.6 TX_DWORD5 (tx_dword5)—Offset 14h

Access Method

Type: Message Bus Register
(Size: 32 bits)

tx_dword5: [Port: 0xA3] + (2480h + 14h)

Op Codes:
0h - Read, 1h - Write

Default: 00000000h

Bit	31	30:24	23:16	15:8	7:0

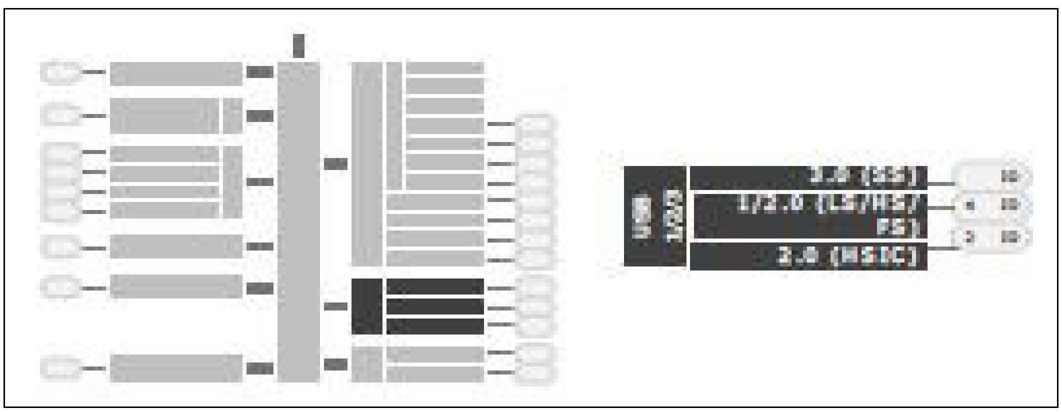
18 USB Host Controller Interfaces (xHCI, EHCI)

The USB Host Controllers (xHCI, EHCI) supports:

- One (1) Super Speed (SS) port on xHCI
- Four (4) Low Speed (LS)/Full Speed (FS)/High Speed (HS) ports on xHCI or EHCI
- Two (2) High Speed (HS) High Speed Inter-Chip (HSIC) ports on xHCI

Note: The SS port must share a LS/FS/HS port to have a full SS connector leaving three LS/FS/HS ports available.

Note: Only one host controller (either xHCI or EHCI) can be used. To enable HSIC and SS ports, xHCI must be used.



18.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 209. USB 3 SS Signals

Signal Name	Direction Plat Power	Description
USB3_TXP/N[0]	O V1P0A	**Data Out:** High speed serialized data outputs. Used for debug mode in xHCI operation.
USB3_RXP/N[0]	I V1P0A	**Data In:** High speed serialized data inputs. Used for debug mode in xHCI operation.
USB3_REXT[0]	I	**Resistor Compensation:** An external resistor must be connected between this pin and package ground. Contact your Intel representative for details.

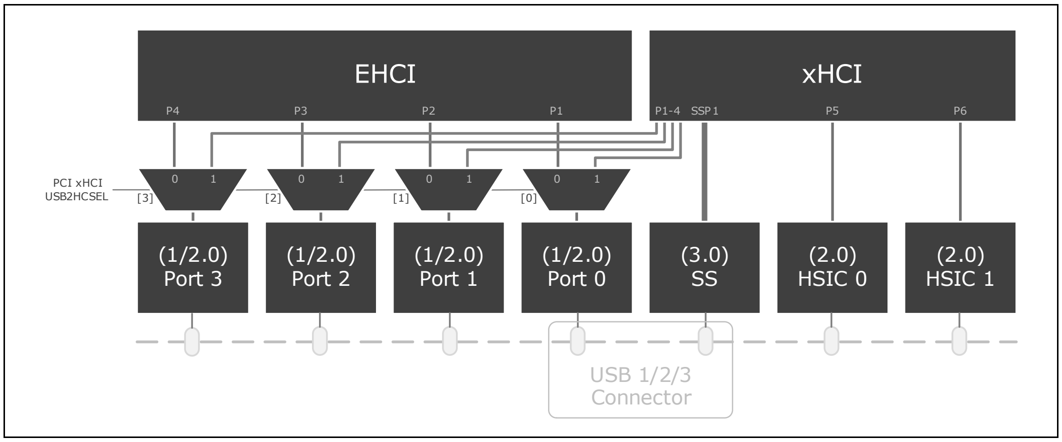
Table 210. USB 2 FS/HS Signals

Signal Name	Direction Plat. Power	Description
USB_DP/N[0:3]	I/O VUSB2	**USB Data:** High speed serialized data I/O. **Note:** USB_DP/N[1] used for debug mode in EHCI operation only. SS port must be implemented to have debug mode during xHCI operation.
USB_OC[0:1]#	I V1P8A	**Over-Current Protection:** Over-current notification for all USB ports (SS/FS/HS/LS).
USB_RCOMPI	I	**Resistor Compensation:** An external resistor must be connected. Contact your Intel representative for details.
USB_RCOMPO	O	**Resistor Compensation:** An external resistor must be connected. Contact your Intel representative for details.

Table 211. USB 2 HSIC Signals

Signal Name	Direction Plat. Power	Description
USB_HSIC[0:1]_DATA	I/O V1P24A	**HSIC Data:** High speed serialized data.
USB_HSIC[0:1]_STROBE	I/O V1P24A	**HSIC Strobe:** Strobe reference for data.
USB_HSIC_RCOMP	I	**Resistor Compensation:** An external resistor must be connected. Contact your Intel representative for details.

Figure 103.xHCI and EHCI Port Mapping



Note: xHCI (3.0) SS is the debug port for xHCI controller.
Note: EHCI (1/2.0) Port 1 is the debug port of the EHCI controller

18.2 USB 3.0 xHCI (Extensible Host Controller Interface)

The xHCI compliant host controller can control up to 7 USB host ports. It supports devices conforming to USB 1.x to 3.0 at bit rates up to 5 Gbps.

18.2.1 Features of USB 3.0 Host

The USB 3.0 Super Speed data interface is a four wire differential (TX and RX pairs) interface that supports simultaneous bi-directional data transmission. The interface supports a bit rate of 5 Gbps with a maximum theoretical data throughput over 3.2 Gbps due to 8b/10b symbol encoding scheme and protocol overhead (link flow control, packet framing and protocol overhead).

Low Frequency Periodic signaling (LFPS) is used to communicate initialization, training and power management information across a link that is in low power link state without using Super Speed signaling. This reduces power consumption.

The USB3.0 port may be paired with any USB2 port at the connector – selection of any USB2 port other than port 0 will require the appropriate mapping.Figure 103 shows the USB3 port paired with USB2 port 0.

USB3.0 Controller Features

- Supported by xHCI software host controller interface
- USB3 port disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 3.0 LPM (U0, U1, U2, and U3) and also a SS Disabled low power state

- Support for USB3 Debug Device

Note: Recommended not to disconnect the connection when a debug session is in progress.

18.2.2 Features of USB HSIC

HSIC is a 2-signal (strobe and data) source synchronous serial interface for on board inter-chip USB communication. The interface uses 240 MHz DDR signaling to provide High-Speed 480 Mb/s USB transfers which are 100% host driver compatible with traditional USB cable connected topologies. Full Speed (FS) and Low Speed (LS) USB transfers are not directly supported by the HSIC interface.

For details of HSIC applications supported, Contact local Intel Sales office.

Major feature and performance highlights are as follows:

- Supported by xHCI software host controller interface
- High-Speed 480 Mb/s data rate only
- Source-synchronous serial interface
- Interface Power is only consumed when a transfer is in progress
- No hot plug removal/attach at HSIC pins
- Signals driven at 1.2V standard LVCMOS levels
- Designed for low power applications
- Support for two host ports compliant to High Speed Inter-Chip Supplement (HSIC) to the USB 2.0 Specification. (USB 2.0)

18.3 USB 2.0 Enhanced Host Controller Interface (EHCI)

The EHCI compliant host controller supports up to 4 USB 2.0 ports in legacy mode. USB 2.0 allows data transfers up to 480 Mbps. The controller integrates a Root Matching Hub (RMH) to support USB 1.1 devices.

Note: The EHCI is not used when the xHCI is used. The EHCI is primarily present for legacy usage, in cases when xHCI support is not available.

Note: Intel recommends using the xHCI controller for the USB2.0 ports irrespective of whether USB3.0 ports are implemented. The EHCI controller is provided for legacy OS/driver compatibility which is generally not required for tablet platforms. Using the xHCI controller will deliver significant power and performance benefits.

When following this recommendation on a platform with no USB3.0 support, the Windows logo requirement of USB debug port may not be met. Please consult with Intel regarding the impact of this.

Note: Unlike the xHCI, bandwidth of all four ports on the EHCI is shared across a single HS (480 Mbps) internal link.

18.3.1 Features of EHCI USB 2.0 Controller

The EHCI USB2.0 Controller supports the following features:

- Compliant with the specification for: USB 1.x, 2.0 (1.5 Mbps, 12 Mbps, 480 Mbps).
- 4 Ports shared with xHCI controller
- Enhanced EHCI descriptor caching
- All ports provided through USB Rate Matching Hubs (RMH) to support FS/LS devices
- Supports one Debug port at USB2 transfer rates
- Supports of USB suspend mode including PLL turn off in S0.
- Supports wakeup from suspend states S5 and remote-suspend wakeup
- All USB2 ports provide support for HS/FS/LS devices
- Per port USB disable
- Supports local dynamic clock gating and trunk clock gating
- Supports USB 2.0 LPM (L0, L1 and L2 low power states)

1	0	0	0	1	1	0	0	0	0	1	1	0	0	0	1
DID															

Bit Range	Default & Access	Field Name (ID): Description
15:0	8C31h RO/V	**Device ID (DID):** See Global Device ID table in Chap. 6 for value **Power Well:** Core

18.6.3 Command (CMD)—Offset 4h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:20, F:0] + 4h

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD					ID	FBE	SERR	WCC	PER	VPS	MWI	SCE	BME	MSE	IOSE

Bit Range	Default & Access	Field Name (ID): Description
15:11	00h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
10	0b RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. **Power Well:** Core
9	0b RO	**Fast Back to Back Enable (FBE):** Reserved. **Power Well:** Core
8	0b RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. See section on error handling. **Power Well:** Core
7	0b RO	**Wait Cycle Control (WCC):** Reserved. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#. **Power Well:** Core
5	0b RO	**VGA Palette Snoop (VPS):** Reserved. **Power Well:** Core
4	0b RO	**Memory Write Invalidate (MWI):** Reserved. **Power Well:** Core
3	0b RO	**Special Cycle Enable (SCE):** Reserved. **Power Well:** Core
2	0b RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus. **Power Well:** Core
1	0b RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set. **Power Well:** Core
0	0b RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only. **Power Well:** Core

18.6.4 Device Status (STS)—Offset 6h

Access Method

Type: PCI Configuration Register (Size: 16 bits) **Offset:** [B:0, D:20, F:0] + 6h

Default: 0290h

15			12				8				4				0
0	0	0	0	0	0	1	0	1	0	0	1	0	0	0	0
DPE	SSE	RMA	RTA	STA	DEVT		MDPED	FBBC	UDF	MC	CL	IS	RSVD		

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
14	0b RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. See error handling section for complete list of conditions handled. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
13	0b RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
12	0b RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
11	0b RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort. **Power Well:** Core
10:9	01b RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only. **Power Well:** Core
8	0b RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
7	1b RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only. **Power Well:** Core
6	0b RO	**User Definable Features (UDF):** Reserved as 0. Read-Only. **Power Well:** Core
5	0b RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only. **Power Well:** Core
4	1b RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer. **Power Well:** Core
3	0b RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit. **Power Well:** Core
2:0	000b RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

18.6.5 Revision ID (RID)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + 8h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RID							

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Revision ID (RID):** See Chap 6 for value. **Power Well:** Core

18.6.6 Programming Interface (PI)—Offset 9h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + 9h

Default: 30h

7			4				0
0	0	1	1	0	0	0	0
PI							

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification. **Power Well:** Core

18.6.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + Ah

Default: 03h

7			4				0
0	0	0	0	0	0	1	1
SCC							

Bit Range	Default & Access	Field Name (ID): Description
7:0	03h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller. **Power Well:** Core

18.6.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Bh

Default: 0Ch

7			4				0
0	0	0	0	1	1	0	0
BCC							

Bit Range	Default & Access	Field Name (ID): Description
7:0	0Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller. **Power Well:** Core

18.6.9 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Dh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MLT							

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0. **Power Well:** Core

18.6.10 Header Type (HT)—Offset Eh

Access Method

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:20, F:0] + Eh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
MFB	CL						

Bit Range	Default & Access	Field Name (ID): Description
7	0b RO	**Multi-Function Bit (MFB):** Read only indicating single function device. **Power Well:** Core
6:0	00h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout. **Power Well:** Core

18.6.11 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

Access Method

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:20, F:0] + 10h

Default: 0000000000000004h

63	60	56	52	48	44	40	36	32	28	24	20	16	12	8	4	0
0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 1 0 0	

Fields: BA (63:16), RSVD (15:4), Prefetchable (3), Type (2:1), RTE (0)

Bit Range	Default & Access	Field Name (ID): Description
63:16	000000000000h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries. **Power Well:** Core
15:4	000h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory. **Power Well:** Core
3	0b RO	**Prefetchable:** This bit is hardwired to 0 indicating that this range should not be prefetched. **Power Well:** Core
2:1	10b RO	**Type:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
0	0b RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space **Power Well:** Core

18.6.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:20, F:0] + 2Ch

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSVID															

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. NOT for EDS:Writes to this register are controlled by the Access Control bit (ACCTRL). **Power Well:** Core

18.6.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:20, F:0] + 2Eh

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSID															

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). NOT for EDS: Writes to this register are controlled by the Access Control bit (ACCTRL). **Power Well:** Core

18.6.14 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 8 bits) **Offset:** [B:0, D:20, F:0] + 34h

Default: 70h

7			4				0
0	1	1	1	0	0	0	0
CAP_PTR							

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges. **Power Well:** Core

18.6.15 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 8 bits) **Offset:** [B:0, D:20, F:0] + 3Ch

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
ILINE							

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. **Power Well:** Core

18.6.16 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: PCI Configuration Register (Size: 8 bits) **Offset:** [B:0, D:20, F:0] + 3Dh

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
IPIN							

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RO/V	**Interrupt pin (IPIN):** Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. See Chap 6 for value. **Power Well:** Core

18.6.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:20, F:0] + 40h

Default: 000000FDh

Bits	Default	Field
31	0	ACCTRL
30:25	000000	ECO1
24	0	RMTASERR
23	0	URD
22	0	URRE
21:19	000	IIL1E
18	0	XHCIL1E
17	0	D3IL1E
16:12	00000	PCPWT
11	0	SWAXHCI
10:8	000	L23HRAWC
7:6	11	UTAGCP
5:4	11	UDAGCNP
3:2	11	UDAGCCP
1:0	01	UDAGC

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset. **Power Well:** Core
30:25	00h RW	**ECO1:** ECO bits are used during silicon bringup for FIBing. NOT for EDS **Power Well:** Core
24	0b RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. **Power Well:** Core
23	0b RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'. **Power Well:** Core
22	0b RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. **Power Well:** Core
21:19	000b RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
18	0b RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled. **Power Well:** Core
17	0b RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set. **Power Well:** Core
16:12	00h RW	**Periodic Complete Pre Wake Time (PCPWT):** signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less **Power Well:** Core
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state. **Power Well:** Core
10:8	000b RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk **Power Well:** Core
7:6	11b RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type **Power Well:** Core
5:4	11b RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type **Power Well:** Core
3:2	11b RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type **Power Well:** Core
1:0	01b RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter **Power Well:** Core

18.6.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:20, F:0] + 44h

Default: 0003C000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/O	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. Any write this register bit will cause it to set. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW. **Power Well:** SUS
30:26	00h RW	**ECO1:** NOT for EDS ECO bits are used during silicon bringup for FIBing. **Power Well:** Core
25	0b RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B **Power Well:** Core
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B **Power Well:** Core
21	0b RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests. **Power Well:** Core
20	0b RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access. **Power Well:** Core
19:14	0Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
13:12	00b RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved **Power Well:** Core
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP. **Power Well:** Core
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes. **Power Well:** Core
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx **Power Well:** Core
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0. **Power Well:** Core
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk **Power Well:** Core
2:0	000b RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B **Power Well:** Core

18.6.19 Clock Gating (XHCLKGTEN)—Offset 50h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:20, F:0] + 50h

Default: 00000120h

Bits	31:29	28	27	26	25	24	23:20	19:16	15	14	13	12	11:10	9:8	7:5	4	3	2	1	0

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Rsvd2:** Reserved **Power Well:** Core
28	0b RW	**Nak’ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation. **Power Well:** Core
27	0b RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating **Power Well:** Core
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown **Power Well:** Core
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. **Power Well:** Core
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met. **Power Well:** Core
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper **Power Well:** Core
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S. **Power Well:** Core
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions. **Power Well:** Core
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle. **Power Well:** Core
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2. **Power Well:** Core
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper **Power Well:** Core
9:8	01b RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off. **Power Well:** Core
7:5	001b RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. **Power Well:** Core
3	0b RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core
2	0b RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core
1	0b RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met. **Power Well:** Core
0	0b RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core

18.6.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:20, F:0] + 58h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
29:16	0000h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX **Power Well:** Core
15:13	0h RO	**Rsvd1:** Reserved. **Power Well:** Core
12:0	0000h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA. **Power Well:** Core

18.6.21 Serial Bus Release Number (SBRN)—Offset 60h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + 60h

Default: 30h

7			4				0
0	0	1	1	0	0	0	0
SBRN							

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0. **Power Well:** SUS

18.6.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + 61h

Default: 20h

7			4				0
0	0	1	0	0	0	0	0
RSVD		FLTV

18.6.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + 71h

Default: 80h

7			4				0
1	0	0	0	0	0	0	0

PM_NEXT

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed. **Power Well:** Core

18.6.26 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:20, F:0] + 72h

Default: C1C2h

15			12				8				4				0
1	1	0	0	0	0	0	1	1	1	0	0	0	0	1	0
PME_Support					D2_Support	D1_Support	Aux_Current			DSI	RSVD	PMEClock	Version		

Bit Range	Default & Access	Field Name (ID): Description
15:11	11000b RW/L	**PME_Support:** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field. NOT for EDS: However, the ability to change this field may prove useful for some systems. **Power Well:** Core
10	0b RW/L	**D2_Support:** The D2 state is not supported. **Power Well:** Core
9	0b RW/L	**D1_Support:** The D1 state is not supported. **Power Well:** Core
8:6	111b RW/L	**Aux_Current:** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. **Power Well:** Core
5	0b RW/L	**DSI:** The Intel PCH reports 0, indicating that no device-specific initialization is required. **Power Well:** Core
4	0b RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
3	0b RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#. **Power Well:** Core
2:0	010b RW/L	**Version:** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification. **Power Well:** Core

18.6.27 Power Management Control/Status (PM_CS)—Offset 74h

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:20, F:0] + 74h

Default: 0008h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
PME_Status	Data_Scale		Data_Select				PME_En	RSVD				NSR	RSVD2	PowerState	

Bit Range	Default & Access	Field Name (ID): Description
15	0b RW/1C	**PME_Status:** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded. **Power Well:** SUS
14:13	00b RO	**Data_Scale:** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register. **Power Well:** Core
12:9	0h RO	**Data_Select:** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register. **Power Well:** Core
8	0b RW	**PME_En:** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded. **Power Well:** SUS
7:4	0h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
3	1b RO	**No Soft Reset (NSR):**), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. **Power Well:** Core
2	0b RO	**Reserved (RSVD2):** Reserved. **Power Well:** Core
1:0	00b RW	**PowerState:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible. **Power Well:** Core

18.6.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

Access Method

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:20, F:0] + 80h

Default: 05h

7			4				0
0	0	0	0	0	1	0	1

UpperAddr

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address. **Power Well:** Core

18.6.33 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

Access Method

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:20, F:0] + 8Ch

Default: 0000h

15			12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Data

Bit Range	Default & Access	Field Name (ID): Description
15:0	0000h RW	**Data:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data. **Power Well:** Core

18.6.34 High Speed Configuration 1 (HSCFG1)—Offset A0h

Not for EDS

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:20, F:0] + A0h

31:22	000h RW	**ECO1:** ECO bits are used during silicon bringup for FIBing. **Power Well:** Core
21:18	0h RW	**LFPS Power Management in U3 Enable (LFPSPMU3):** This field allows xHC to turn off LFPS Receiver when the port is in U3. This allows the Host Controller to save some extra power (about 50W per port) in idle states if device connected on a port is not Resume capable or Resume enabled. This choice has to be done by BIOS and based on platform knowledge. For example, if an in-box device is not Resume Capable, BIOS could allow xHC to turn-off Rx LFPS when the port is in U3. Each bit represents a port. Bit (16) is for USB3.0 Port 0, Bit (17) is for USB3.0 Port 1 and so on. 0 in a bit position: LFPS Receiver shall be kept enabled when the port is in U3. 1 in a bit position: LFPS Receiver shall be disabled when the port is in U3. **Power Well:** SUS
17	0b RW	**LFPS Power Management Enable (LFPSPME):** This field provides programmability of LFPS Receiver power management capability when USB3.0 ports are Disabled or in Disconnected state. 0: Do not power manage LFPS receiver. LFPS receivers are enabled in all states. 1: Power manage LFPS receiver. LFPS receivers will be turned off if USB3.0 port is Disabled or Disconnected. Note: Default value is being kept at 0 in case EXI architecture/design takes the path of not doing dynamic Rx LFPS enabling for EXI signature detect and disable LFPS Power Management to keep Rx LFPS buffer on for debug. **Power Well:** SUS
16	0b RW	**USB3 SS Port Polling Enable (SSPPEN):** 0: Prevent USB3 Super-speed port to start Polling.LFPS. 1: Allow USB3 Super-speed port to start Polling.LFPS. NOTE: This bit will take effect in allowing/preventing USB3 SS port from starting Polling.LFPS only if SSPPENAB is cleared. **Power Well:** Core
15	0b RO	**Rsvd1:** Reserved. **Power Well:** Core
14	0b RW	**MODPHY Power Gate Enable for U2 (MPHYPGEU2):** This bit controls whether LPT-LPT xHC will allow modPHY power gating or not when a port is in U2 state. Note that this single bit controls all ports of xHC. 0b xHC shall not initiate Power Gate Request If xHC had initiated Power Gate Request before this bit is programmed to 0, xHC shall initiate the handshake to wake modPHY from power gated state. 1b xHC is enabled to initiate Power Gate Request if power gating conditions are met. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
13	0b RW	**MODPHY Power Gate Enable for non-U2 states (MPHYPGENONU2):** This bit controls whether LPT-LPT xHC will allow modPHY power gating or not when a port is in states other than U2. Note that this single bit controls all ports of xHC. 0b xHC shall not initiate Power Gate Request If xHC had initiated Power Gate Request before this bit is programmed to 0, xHC shall initiate the handshake to wake modPHY from power gated state. 1b xHC is enabled to initiate Power Gate Request if power gating conditions are met. **Power Well:** Core
12	0h RW	**xHC SS Async Active Propogation Enable (SSAAPE):** This register controls the ss async active exposusre to PMC via the xHC active indication 0 SS Async Active is not propogated to PMC 1 SS Async Active is propogated to PMC **Power Well:** Core
11:8	0h RO	**Rsvd2:** Reserved **Power Well:** Core
7	1b RW	**USB3 SS Port Polling Enable Active (SSPPENAB):** 0: Allow blocking of USB3 Super-speed port from starting Polling.LFPS. 1: Disallow blocking of USB3 Super-speed port from starting Polling.LFPS (A stepping behavior). NOTE: When this bit is cleared, Polling.LFPS blocking is controlled by SSPPEN bit. **Power Well:** SUS
6	0h RW	**ECO2:** ECO bits are used during silicon bringup for FIBing. **Power Well:** SUS
5	0h RW	**Receiver Detect Staggering Disable (RXDETSTGDIS):** When set, this regiter bit disables receiver detect staggering between all 6 USB3 lanes Note that the bit is ONLY meant for SW to disable the staggering if desired. Once it is set to disabled, SW is not allowed to re-enable the staggering by clearing the bit. **Power Well:** SUS
4:3	1h RW	**Gotorxelecidle Polling Timer Timeout Value (G2RXPTTV):** Timeout value for Gotorxelecidle Polling Timer: 00: 1 to 2 us (Simulation speed up mode only). 01: 19 to 20 us (Default). 10: 23 to 24 us. 11: 199 to 200 us. This register needs to be programmed when G2RXPOLLTMREN = 0. **Power Well:** SUS
2	1b RW	**Gotorxelecidle Polling Timer Enable (G2RXPTE):** If enabled (1), Gasket starts a timer after transmitting high speed data AND not receiving LFPS, and will only de-assert GoToRxElecIdle after timer expires during Polling. If disabled (0), Gasket will assert / de-assert GoToRxElecIdle purely based on Gotorxelecidle assertion upon RxElecIdle de-assertion (LFPS detected) enable bit (G2RXERXEE) and Gotorxelecidle assertion when not transmitting high speed data enable bit (G2RXETXHSDE) **Power Well:** SUS
1	1b RW	**GotoRxElecidle Assertion Upon RxElecIdle Exit Enable (G2RXERXEE):** When enabled (set to '1'), allow Gasket to assert GoToRxElecIdle to UAFE to turn off its receiver upon the de-assertion of GoToRxElecIdle (LFPS detected). This bit needs to be programmed when the USB3 port is not enabled. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
0	1b RW	**GotoRxElecidle Assertion When Transmitting High Speed Data Enable (G2RXETXHSDE):** When enabled (set to '1'), allow Gaskets to assert GoToRxElecIdle to UAFE to turn off its receiver when not transmitting high speed data: P0 and TxElecIdle = 1. This bit needs to be programmed when the USB3 port is not enabled. **Power Well:** SUS

18.6.37 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset C0h

The RW/L property of this register is controlled by OCCFDONE bit.

18.6.40 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset CCh

The RW/L property of this register is controlled by OCCFDONE bit. Note: U3OCM2 allows the OC pins 8:5 to be mapped to the same 6 SS ports that U3OCM1 allows. This a llows flexibility in pairing SS ports with HS ports at the connector. Care must be taken to make s ure OC pin assignment is consistent across USB3 and USB2 ports (depending upon the pairing).

Access Method

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	**Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet **Power Well:** Core
0	0b RW	**Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported **Power Well:** Core

18.7 USB xHCI Memory Mapped I/O Registers

Table 213. Summary of USB xHCI Memory Mapped I/O Registers—MBAR

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–0h	1	"Capability Registers Length (CAPLENGTH)—Offset 0h" on page 2176	80h
2–3h	2	"Host Controller Interface Version Number (HCIVERSION)—Offset 2h" on page 2176	0100h
4–7h	4	"Structural Parameters 1 (HCSPARAMS1)—Offset 4h" on page 2177	07000820h
8–Bh	4	"Structural Parameters 2 (HCSPARAMS2)—Offset 8h" on page 2178	84000054h
C–Fh	4	"Structural Parameters 3 (HCSPARAMS3)—Offset Ch" on page 2179	00040001h
10–13h	4	"Capability Parameters (HCCPARAMS)—Offset 10h" on page 2180	200071E1h
14–17h	4	"Doorbell Offset (DBOFF)—Offset 14h" on page 2182	00003000h
18–1Bh	4	"Runtime Register Space Offset (RTSOFF)—Offset 18h" on page 2182	00002000h
80–83h	4	"USB Command (USBCMD)—Offset 80h" on page 2183	00000000h
84–87h	4	"USB Status (USBSTS)—Offset 84h" on page 2185	00000001h
88–8Bh	4	"Page Size (PAGESIZE)—Offset 88h" on page 2187	00000001h
94–97h	4	"Device Notification Control (DNCTRL)—Offset 94h" on page 2188	00000000h
98–9Bh	4	"Command Ring Low (CRCR_LO)—Offset 98h" on page 2189	00000000h
9C–9Fh	4	"Command Ring High (CRCR_HI)—Offset 9Ch" on page 2190	00000000h
B0–B3h	4	"Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h" on page 2191	00000000h
B4–B7h	4	"Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h" on page 2191	00000000h
B8–BBh	4	"Configure (CONFIG)—Offset B8h" on page 2192	00000000h
480–483h	4	"Port 1 Status and Control USB3 (PORTSC1USB2)—Offset 480h" on page 2193	000002A0h
484–487h	4	"Port 1 Power Management Status and Control USB2 (PORTPMSC1USB2)—Offset 484h" on page 2194	00000000h
48C–48Fh	4	"Port X Hardware LPM Control Register (PORTHLPM1)—Offset 48Ch" on page 2196	00000000h
490–493h	4	"Port 2 Status and Control USB3 (PORTSC2USB2)—Offset 490h" on page 2197	000002A0h
494–497h	4	"Port 2 Power Management Status and Control USB2 (PORTPMSC2USB2)—Offset 494h" on page 2199	00000000h
49C–49Fh	4	"Port X Hardware LPM Control Register (PORTHLPM2)—Offset 49Ch" on page 2200	00000000h
4A0–4A3h	4	"Port 3 Status and Control USB3 (PORTSC3USB2)—Offset 4A0h" on page 2200	000002A0h
4A4–4A7h	4	"Port 3 Power Management Status and Control USB2 (PORTPMSC3USB2)—Offset 4A4h" on page 2202	00000000h
4AC–4AFh	4	"Port X Hardware LPM Control Register (PORTHLPM3)—Offset 4ACh" on page 2203	00000000h
4B0–4B3h	4	"Port 4 Status and Control USB3 (PORTSC4USB2)—Offset 4B0h" on page 2204	000002A0h
4B4–4B7h	4	"Port 4 Power Management Status and Control USB2 (PORTPMSC4USB2)—Offset 4B4h" on page 2206	00000000h

Table 213. Summary of USB xHCI Memory Mapped I/O Registers—MBAR (Continued)

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4BC–4BFh	4	"Port X Hardware LPM Control Register (PORTHLPM4)—Offset 4BCh" on page 2207	00000000h
4C0–4C3h	4	"Port 8 Status and Control USB2 (PORTSC5USB2)—Offset 4C0h" on page 2208	000002A0h
4C4–4C7h	4	"Port 5 Power Management Status and Control USB2 (PORTPMSC5USB2)—Offset 4C4h" on page 2210	00000000h
4CC–4CFh	4	"Port X Hardware LPM Control Register (PORTHLPM5)—Offset 4CCh" on page 2211	00000000h
4D0–4D3h	4	"Port 6 Status and Control USB2 (PORTSC6USB2)—Offset 4D0h" on page 2212	000002A0h
4D4–4D7h	4	"Port 6 Power Management Status and Control USB2 (PORTPMSC6USB2)—Offset 4D4h" on page 2214	00000000h
4DC–4DFh	4	"Port X Hardware LPM Control Register (PORTHLPM6)—Offset 4DCh" on page 2215	00000000h
4E0–4E3h	4	"Port 1 Status and Control USB3 (PORTSC1USB3)—Offset 4E0h" on page 2215	000002A0h

18.7.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is used as an offset to add to register base, to find the beginning of the Operational Register Space. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [MBAR] + 0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 80h

7			4				0
1	0	0	0	0	0	0	0
CAPLENGTH							

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH):** This field is used as an offset to add to register base, to find the beginning of the Operational Register Space. **Power Well:** Core

18.7.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 16 bits)

Offset: [MBAR] + 2h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 0100h

15			12				8				4				0
0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

HCIVERSION

Bit Range	Default & Access	Field Name (ID): Description
15:0	0100h RO	**Host Controller Interface Version Number (HCIVERSION):** This is a two-byte field containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this field represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0. **Power Well:** Core

18.7.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register defines basic structural parameters supported by this xHC implementation: Number of Device Slots support, Interrupters, Root Hub ports, etc. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 07000820h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	1	0	0	0	0	0

MaxPorts | Rsvd1 | MaxIntrs | MaxSlots

Bit Range	Default & Access	Field Name (ID): Description
31:24	07h RO	**Number of Ports (MaxPorts):** This field specifies the maximum Port Number value, i.e the highest number of Port Register Sets that are addressable in the Operational Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an *xHCI Supported Protocol Capability*, described in the xHCI for USB specification. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set. **Power Well:** Core
23:19	00h RW/L	**Rsvd1:** Reserved. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
18:8	008h RW/L	**Number of Interrupters (MaxIntrs):** This field specifies the number of Interrupters implemented on this host controller. Each Interrupter is allocated to a vector of MSI-X, and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to 400h. A '0' in this field is undefined. **Power Well:** Core
7:0	20h RW/L	**Number of Device Slots (MaxSlots):** This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1h to 400h. A '0' in this field is undefined. **Power Well:** Core

18.7.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register defines additional xHC structural parameters. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 84000054h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0

Bits	Field
31:27	MaxScratchpadBufs
26	SPR
25:8	Rsvd1
7:4	ERSTMax
3:0	IST

Bit Range	Default & Access	Field Name (ID): Description
31:27	10h RW/L	**Max Scratchpad Buffers (MaxScratchpadBufs):** Valid values are 0-31. This field indicates the number of Scratchpad Buffers system software shall reserve for the xHC. Refer to xHCI for USB specification for more information. **Power Well:** Core
26	1b RW/L	**Scratchpad Restore (SPR):** If *Max Scratchpad Buffers* is greater than '0' then this flag indicates whether the xHC uses the Scratchpad Buffers for saving state when executing Save and Restore State operations. If *Max Scratchpad Buffers* is = '0', then this flag shall be '0'. Refer to the xHCI for USB specification for more information. A value of '1' indicates that the xHC requires the integrity of the Scratchpad Buffer space to be maintained across power events. A value of '0' indicates that the Scratchpad Buffer space may be freed and reallocated between power events. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
25:8	00000h RW/L	**Rsvd1:** Reserved. **Power Well:** Core
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMax):** Valid values are 0-15. This field determines the maximum value supported by the *Event Ring Segment Table Base Size* registers (5.5.2.3.1), where The maximum number of Event Ring Segment Table entries = 2^(ERST Max) e.g. if the ERST Max = 7, then the xHC *Event Ring Segment Table(s)* supports up to 128 entries, if ERST Max = 15, then 32K entries, etc. **Power Well:** Core
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST):** The value in this field indicates to system software the minimum distance (in time) that it is required to stay ahead of the host controller while adding TRBs, in order to have the host controller process them at the correct time. The value shall be specified in terms of number of frames/microframes. If bit [3] of IST is cleared to '0', software can add a TRB no later than IST[2.0] microframes before that TRB is scheduled to be executed. If bit [3] of IST is set to '1', software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed. Refer to the xHCI for USB specification for details on how software uses this information for scheduling isochronous transfers. **Power Well:** Core

18.7.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register defines link exit latency related structural parameters. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00040001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
U2DEL																Rsvd1								U1DEL							

Bit Range	Default & Access	Field Name (ID): Description
31:16	0004h RW/L	**U2 Device Exit Latency (U2DEL):** Worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: • 0000h = Zero • 0001h = Less than 1 s • 0002h = Less than 2 s • • 07FFh = Less than 2047 s. • 0800-FFFFh = Reserved **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
15:8	00h RW/L	**Rsvd1:** Reserved. **Power Well:** Core
7:0	01h RW/L	**U1 Device Exit Latency (U1DEL):** Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values: • 01h = Less than 1 s • 02h = Less than 2 s • ... • 0Ah = Less than 10 s • 0B-FFh = Reserved **Power Well:** Core

18.7.6 Capability Parameters (HCCPARAMS)—Offset 10h

The default values for all fields in this register are implementation dependent. This register defines optional capabilities supported by the xHCI. This register is modified and maintained by BIOS.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 10h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 200071E1h

Bits	31:16	15:12	11:9	8	7	6	5	4	3	2	1	0
Value	0010 0000 0000 0000	0111	000	1	1	1	1	0	0	0	0	1
Field	xECP	MaxPSASize	Rsvd1	PAE	NSS	LTC	LHRC	PIND	PPC	CSZ	BNC	AC64

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (xECP):** This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability. For example, using the offset of Base is 1000h and the xECP value of 0068h, we can calculate the following effective address of the first extended capability: 1000h + (0068h ((2) -) 1000h + 01A0h -) 11A0h a. This is not tightly coupled with the USBBASE address register mapping control. **Power Well:** Core
15:12	7h RW/L	**Maximum Primary Stream Array Size (MaxPSASize):** This field identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2^(MaxPSASize+1). Valid MaxPSASize values are 0 to 15, where 0 indicates that Streams are not supported. **Power Well:** Core
11:9	0h RW/L	**Rsvd1:** Reserved. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
8	1b RW/L	**Parse All Event Data (PAE):** This flag indicates whether the host controller implementation parses all Event Data TRBs while advancing to the next TD after a Short Packet, or skips all but the first Event Data TRB. A 1 in this bit indicates that all Event Data TRBs are parsed. A 0 in this bit indicates that only the first Event Data TRB is parsed. Refer to the xHCI for USB specification. **Power Well:** Core
7	1b RW/L	**No Secondary SID Support (NSS):** This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. Refer to the xHCI for USB specification. **Power Well:** Core
6	1b RW/L	**Latency Tolerance Messaging Capability (LTC):** This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to the xHCI for USB specification. **Power Well:** Core
5	1b RW/L	**Light HC Reset Capability (LHRC):** This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the *Light Host Controller Reset* (LHCRST) flag in the USBCMD register. Refer to the xHCI for USB specification. **Power Well:** Core
4	0b RW/L	**Port Indicators (PIND):** This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/ writeable field for controlling the state of the port indicator. Refer to the xHCI for USB specification for the definition of the *Port Indicator Control* field. **Power Well:** Core
3	0b RO	**Port Power Control (PPC):** This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port does not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register. See the xHCI for USB specification. **Power Well:** Core
2	0b RW/L	**Context Size (CSZ):** If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does *not* apply to Stream Contexts. **Power Well:** Core
1	0b RW/L	**BW Negotiation Capability (BNC):** This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: • 0 = BW Negotiation not implemented • 1 = BW Negotiation implemented Refer to the xHCI for USB specification for more information on Bandwidth Negotiation. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
0	1b RW/L	**64-bit Addressing Capability (AC64):** This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: • 0 = 32-bit address memory pointers implemented • 1 = 64-bit address memory pointers implemented If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers. **Power Well:** Core

18.7.7 Doorbell Offset (DBOFF)—Offset 14h

This register defines the offset of the Doorbell Array base address from the Base.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 14h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00003000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:2	Bits 1:0
DBAO	Rsvd1

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000C00h RO	**Doorbell Array Offset (DBAO):** This field defines the offset in Dwords of the Doorbell Array base address from the Base i.e. the base address of the xHCI Capability register address space. **Power Well:** Core
1:0	0h RO	**Rsvd1:** Reserved. **Power Well:** Core

18.7.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

This register defines the offset of the HCI Runtime Registers from the Base.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 18h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00002000h

18.7.9 USB Command (USBCMD)—Offset 80h

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 80h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	RS

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RO	**Rsvd2:** Reserved. **Power Well:** Core
11	0b RW	**Enable U3 MFINDEX Stop (EU3S):** When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to the xHCI for USB specification for more information. **Power Well:** Core
10	0b RW	**Enable Wrap Event (EWE):** When set to 1, the xHC shall generate an MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
9	0b RW	**Controller Restore State (CRS):** When set to 1, and HCHalted (HCH) = 1, then the xHC shall perform a Restore State operation and restore its internal state. When set to 1 and *Run/Stop* (R/S) = 1 or *HCHalted* (HCH) = 0, or when cleared to 0, no Restore State operation shall be performed. This flag always returns 0 when read. Refer to the *Restore State Status* (RSS) flag in the USBSTS register for information on Restore State completion. Refer to the xHCI for USB specification, for more information. Note that undefined behavior may occur if a Restore State operation is initiated while *Save State Status* (SSS) = 1. When this register is exposed by a Virtual Function (VF), this bit only controls restoring the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
8	0b RW	**Controller Save State (CSS):** When written by software with 1 and HCHalted (HCH) = 1, then the xHC shall save any internal state that may be restored by asubsequent Restore State operation. When written by software with 1 and HCHalted (HCH) =0, or written with 0, no Save State operation shall be performed. This flag always returns 0 when read. Refer to the Save State Status (SSS) flag in the USBSTS register for information on Save State completion. Refer to the xHCI for USB specification for more information on xHC Save/Restore operation. Note that undefined behavior may occur if a Save State operation is initiated while Restore State Status (RSS) = 1. When this register is exposed by a Virtual Function (VF), this bit only controls saving the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
7	0b RW	**Light Host Controller Reset (LHCRST):** Optional normative. If the *Light HC Reset Capability* (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the *Light Host Controller Reset* has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the *Light Host Controller Reset* has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. (Refer to the xHCI for USB specification for more information.) When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. disabling the VF's device slots and setting the associated VF Run bit to Stopped. Refer to the xHCI for USB specification for more information. **Power Well:** Core
6:4	0h RO	**Rsvd1:** Reserved. **Power Well:** Core
3	0b RW	**Host System Error Enable (HSEE):** When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to the xHCI for USB specification for more information. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**Interrupter Enable (INTE):** This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, i.e. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSIX, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF. **Power Well:** Core
1	0b RW	**Host Controller Reset (HCRST):** This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reseta shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller, as described in the xHCI for USB specification, in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
0	0b RW	**Run/Stop (RS):** • 1 = Run • 0 = Stop When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may yield undefined resultsresult in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF. **Power Well:** Core

18.7.10 USB Status (USBSTS)—Offset 84h

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to '0' in this register by writing a '1' to it (RW1C). Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)* for additional information concerning USB interrupt conditions.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:13	00000h RO	**Rsvd3:** Reserved. **Power Well:** Core
12	0b RO	**Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec. **Power Well:** Core
11	0b RO	**Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec. **Power Well:** Core
10	0b RW/C	**Save/Restore Error (SRE):** If an error occurs during a Save or Restore operation, this bit shall be set to 1. This bit shall be cleared to 0 when a Save or Restore operation is initiated or when written with 1. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
9	0b RO	**Restore State Status (RSS):** When the Controller Restore State (CRS) flag in the USBCMD register is written with 1 this bit shall be set to 1 and remain 1 while the xHC restores its internal state. When the Restore State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the restoring the state for the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
8	0b RO	**Save State Status (SSS):** When the *Controller Save State* (CSS) flag in the USBCMD register is written with 1, this bit shall be set to 1 and remain 1 while the xHC saves its internal state. When the Save State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the saving the state for the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
7:5	0h RO	**Rsvd2:** Reserved. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4	0b RW/C	**Port Change Detect (PCD):** The xHC sets this bit to a 1 when any port has a change bit transition from a 0 to a 1. This bit is allowed to be maintained in the Aux Power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits. Refer to the xHCI for USB specification for more information. This bit provides system software an efficient means of determining if there has been Root Hub port activity. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Root Hub Ports associated with the Device Slots assigned to the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core
3	0b RW/C	**Event Interrupt (EINT):** The xHC sets this bit to 1 when the *Interrupt Pending* (IP) bit of any Interrupter transitions from 0 to 1. Refer to the xHCI for USB specification for usage information. Software that uses *EINT* shall clear it prior to clearing any IP flags. A race condition may occur if software clears the *IP* flags, then clears the *EINT* flag, and between the operations another *IP* 0 to '1' transition occurs. In this case, the new IP transition shall be lost. When this register is exposed by a Virtual Function (VF), this bit is the logical 'OR' of the IP bits for the Interrupters assigned to the selected VF. And it shall be cleared to 0 when all associated interrupter IP bits are cleared, i.e. all the VFs Interrupter Event Ring(s) are empty. Refer to the xHCI for USB specification for more information. **Power Well:** Core
2	0b RW/C	**Host System Error (HSE):** The xHC sets this bit to 1 when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. (In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort.) When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USBCMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USBCMD register is a 1, the xHC shall also assert out-of-band error signaling to the host. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the assertion of this bit affects all VFs and reflects the Host System Error state of the Physical Function (PF0). Refer to the xHCI for USB specification for more information. **Power Well:** Core
1	0b RO	**Rsvd1:** Reserved. **Power Well:** Core
0	1b RO	**HCHalted (HCH):** This bit is a 0 whenever the *Run/Stop* (R/S) bit is a 1. The xHC sets this bit to 1 after it has stopped executing as a result of the *Run/Stop* (R/S) bit being cleared to 0, either by software or by the xHC hardware (e.g. internal error). If this bit is '1', then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC, and any received Transaction Packet shall be dropped. When this register is exposed by a Virtual Function (VF), this bit only reflects the Halted state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information. **Power Well:** Core

18.7.11 Page Size (PAGESIZE)—Offset 88h

The default value for this register is implementation dependent.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 88h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Rsvd1 (bits 31:16), PAGESIZE (bits 15:0)

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Rsvd1:** Reserved. **Power Well:** Core
15:0	0001h RO	**Page Size (PAGESIZE):** This field defines the page size supported by the xHC implementation. This xHC supports a page size of 2^(n+12) if bit n is Set. For example, if bit 0 is Set, the xHC supports 4k byte page sizes. For a Virtual Function, this register reflects the page size selected in the *System Page Size* field of the SR-IOV Extended Capability structure. For the Physical Function 0, this register reflects the implementation dependent default xHC page size. Various xHC resources reference PAGESIZE to describe their minimum alignment requirements. The maximum possible page size is 128M. **Power Well:** Core

18.7.12 Device Notification Control (DNCTRL)—Offset 94h

This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A *Notification Enable* (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset, all notifications are disabled. Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)*. This register shall be written as a Dword. Byte writes produce undefined results.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

18.7.19 Port 1 Power Management Status and Control USB2 (PORTPMSC1USB2)—Offset 484h

This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a *Host Controller Reset* (HCRST). The USB2 Port Power Management Status and Control register provides the USB2 LPM parameters necessary for the xHC to generate a LPM Token to the downstream device.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 484h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PTC				Rsvd1											HLE	L1DS								HIRD				RWE	L1S		

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky. **Power Well:** SUS
27:17	000h RO	**Rsvd1:** Reserved. **Power Well:** Core
16	0b RO	**Hardware LPM Enable (HLE):** Reserved. **Power Well:** SUS
15:8	00h RW	**L1 Device Slot (L1DS):** Note: This register is sticky. System software sets this field to indicate the ID of the Device Slot associated with the device directly attached to the Root Hub port. A value of 0 indicates no device is present. The xHC uses this field to lookup information necessary to generate the LPM Token packet. **Power Well:** SUS
7:4	0h RW	**Best Effort Service Latency (HIRD):** Note: This register is sticky. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. For more information about *BESL* value encoding, refer to the xHCI for USB specification. Note that the *BESL* field is used by both software and hardware controlled LPM. Refer to the xHCI for USB specification for more information on *BESL* use and how *DBESL* may be used to establish an initial value for BESL. **Power Well:** SUS
3	0b RW	**Remote Wake Enable (RWE):** Note: This register is sticky. System software sets this flag to enable or disable the device for remote wake from L1. The value of this flag shall temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, revision 2.0, Chapter 9. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky. This field is used by software to determine whether an L1- based suspend request (LPM transaction) was successful, specifically: • 0 = Invalid - This field shall be ignored by software. • 1 = Success - Port successfully transitioned to L1 (ACK) • 2 = Not Yet - Device is unable to enter L1 at this time (NYET) • 3 = Not Supported - Device does not support L1 transitions (STALL) • 4 = Timeout/Error - Device failed to respond to the LPM Transaction or an error occurred • 5-7 = Reserved The value of this field is only valid when the port resides in the L0 or L1 state (*PLS* = 0 or 2). Refer to the xHCI for USB specification for more information. **Power Well:** SUS

18.7.20 Port X Hardware LPM Control Register (PORTHLPM1)—Offset 48Ch

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

18.7.29 Port X Hardware LPM Control Register (PORTHLPM4)—Offset 4BCh

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 4BCh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

18.7.39 Microframe Index (MFINDEX)—Offset 2000h

This register is used by the system software to determine the current periodic frame. The register value is incremented every 125 microseconds (once each microframe). This register is only incremented while *Run/Stop* = '1'. The value of this register affects the SOF value generated by USB2 Bus Instances.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

18.7.76 Interrupter 6 Moderation (IMOD6)—Offset 20C4h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 20C4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000FA0h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 1	1 0 1 0	0 0 0 0	

Bits 31:16	Bits 15:0
IMODC	IMODI

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be written directly by software at any time to alter the interrupt rate. **Power Well:** Core
15:0	0FA0h RW	**Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty. **Power Well:** Core

18.7.77 Event Ring Segment Table Size 6 (ERSTSZ6)—Offset 20C8h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 20C8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31:0	00000000h RW	**Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0. **Power Well:** Core

18.7.94 Event Ring Dequeue Pointer Low 8 (ERDP_LO8)—Offset 2118h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 2118h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ERDP (31:4), EHB (3), DESI (2:0)

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer. **Power Well:** Core
3	0b RW/C	**Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information. **Power Well:** Core
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. **Power Well:** Core

18.7.95 Event Ring Dequeue Pointer High 8 (ERDP_HI8)—Offset 211Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 211Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ERDP

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer. **Power Well:** Core

18.7.96 Door Bell 1 (DOORBELL1)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 3000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DBSID (31:16), Rsvd1 (15:8), DBT (7:0)

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**DB Stream ID (DBSID):** If the endpoint of a Device Context Doorbell defines Streams, then this field shall be used to identify which Stream of the endpoint the doorbell reference is targeting. System software is responsible for ensuring that the value written to this field is valid. If the endpoint defines Streams *(MaxPStreams) 0)*, then 0, 65535 (No Stream) and 65534 (Prime) are reserved Stream ID values and shall not be written to this field. If the endpoint does not define Streams *(MaxPStreams = 0)* and a non-'0' value is written to this field, the doorbell reference shall be ignored. This field only applies to *Device Context Doorbells* and shall be cleared to 0 for *Host Controller Command Doorbells*.[br This field returns 0 when read. **Power Well:** Core
15:8	00h RO	**Rsvd1:** Reserved. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
7:0	00h RW	**DB Target (DBT):** This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Note that Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers. • **Device Context Doorbells (1-255)** • 0 = Reserved • 1 = Control EP 0 Enqueue Pointer Update • 2 = EP 1 OUT Enqueue Pointer Update • 3 = EP 1 IN Enqueue Pointer Update • 4 = EP 2 OUT Enqueue Pointer Update • 5 = EP 2 IN Enqueue Pointer Update • ... • 30 = EP 15 OUT Enqueue Pointer Update • 31 = EP 15 IN Enqueue Pointer Update • 32:247 = Reserved • 248:255 = Vendor Defined • **Host Controller Doorbell (0)** • 0 = Command Doorbell • 248:255 = Vendor Defined This field returns '0' when read, and should be treated as 'undefined' by software. When the Command Doorbell is written, the DB Stream ID field shall be cleared to 0. **Power Well:** Core

18.7.97 Door Bell 2 (DOORBELL2)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. A write of 1 to this register will issue a cold reset to USB3 ports. **Power Well:** SUS
30	0b RW	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
29	0b RW	**Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset. **Power Well:** SUS
28	0b RW	**Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1. **Power Well:** SUS
27	0b RW	**Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate. **Power Well:** SUS
26	0b RW	**Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1. **Power Well:** SUS
25	0b RW	**Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS **Power Well:** SUS
24	1b RW	**Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1, prevent a reset being generated due to the USB3 port link down condition. **Power Well:** SUS
23	0b RW	**Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1, ignore the main power up reset for USB3 PIPE PHY reset. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
22	1b RW	**RESERVED (RSVD_1):** Reserved. **Power Well:** SUS
21	0b RW	**Ignore HC Reset USB2 (IGN_HC_RST_U2):** When set to '1', ignore HC reset to reset the USB2 Port logic. **Power Well:** SUS
20	1b RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):** When set to '1', ignore HC reset to the USB PHY power-on reset. **Power Well:** SUS
19	1b RW	**Enable PCIe Link-Down Reset (EN_PLD_RST):** Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core. **Power Well:** SUS
18	1b RW	**Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):** When set to '1', enable EEPROM reload on every main power-up. **Power Well:** SUS
17	1b RW	**Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):** When set to '1', ignore HC reset to the PCIe PHY PIPE reset. **Power Well:** SUS
16	1b RW	**Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):** When set to '1', ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset. **Power Well:** SUS
15	1b RW	**Ignore Warm Reset USB PHY Power (IGN_WR_UPP):** When set to '1', ignore warm reset the USB PHY power on reset. **Power Well:** SUS
14	1b RW	**Allow Core PCIe Link Down Reset (ALL_CPLD_RST):** When set to '1', allow PCIe link down to cause a reset to the rest of the core. **Power Well:** SUS
13	0b RW	**Ignore Hot Reset USB3 (IGN_HR_U3):** When set to '1', ignore hot reset to the USB3 port logic. **Power Well:** SUS
12	0b RW	**Ignore Warm Reset USB3 (IGN_WR_U3):** When set to '1', ignore warm reset to the USB3 port logic **Power Well:** SUS
11	0b RW	**Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):** When set to '1', ignore main power up reset to USB3 port logic. **Power Well:** SUS
10	0b RW	**Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):** When set to '1', ignore main power up reset to USB2 port logic. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
9	0b RW	**Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):** When set to '1', ignore main power up reset to PCIe core. **Power Well:** SUS
8	0b RW	**Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):** When set to '1', ignore main power up reset to PCIe PHY. **Power Well:** SUS
7	1b RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP):** When set to '1', ignore HC reset to the USB PHY. **Power Well:** SUS
6	1b RW	**Ignore Warm Reset USB PHY (IGN_WRST_UP):** When set to '1', ignore warm reset to the USB PHY. **Power Well:** SUS
5	1b RW	**Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):** Enables the HC reset or per port reset isolation function. **Power Well:** Core
4	1b RW	**Allow Power Off Power Domain Reset (ALL_PO_PDRST):** When set to '1', allow main power off condition to trigger a main power domain reset. **Power Well:** SUS
3	0b RW	**Ignore Wait For PERST# During Power Shut Down (IGN_PERST_PSD):** When set to '1', ignore waiting for PERST# deassertion during main power shut down. **Power Well:** SUS
2	0b RW	**Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):** If this bit is set and a fundamental reset is asserted during AUX power up, then PERST# shall be ignored and a timeout will be allowed to deassert fundamental reset instead. **Power Well:** SUS
1:0	0h RW	**Trigger Fundamental Reset (TRIG_FRST):** Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset **Power Well:** SUS

18.7.151 Super Speed Bandwidth Overload (HOST_BW_OV_SS_REG)—Offset 80C4h

Access Method

4:1	0 0 0 0	FORCED_PM_STATE
0	0	INIT_FPMS

Bit Range	Default & Access	Field Name (ID): Description
31	1b RW	**D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from a pin input set to 1, but we allow software to alter it, if needed. • 1 = D3 hot enabled • 0 = D3 hot not abled. **Power Well:** SUS
30	0b RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state. **Power Well:** SUS
29	0b RW	**Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal. **Power Well:** SUS
28	0b RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
27	0b RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a foundamental reset **Power Well:** SUS
26	0b RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1. **Power Well:** SUS
25	0b RW	**Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1. **Power Well:** SUS
24	0b RW	**Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0. **Power Well:** SUS
23	1b RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function. **Power Well:** SUS
22	0b RW	**RESERVED (RSVD_1):** Reserved. **Power Well:** SUS
21	0b RW	**Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function. **Power Well:** SUS
20	0b RW	**cfg pcie txreg rd (CPTR):** Reserved. **Power Well:** SUS
19	1b RW	**cfg iob drivestrength[1] (CIDS1):** Reserved. **Power Well:** SUS
18	1b RW	**cfg iob drivestrength[0] (CIDS0):** Reserved. **Power Well:** SUS
17	0b RW	**Enable CFG USB P2 (EN_CFG_UP2):** When set to '1' enable cfg usb p2 **Power Well:** SUS
16	1b RW	**cfg clk gate dis (CCGD):** Reserved. **Power Well:** SUS
15	1b RW	**Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3 **Power Well:** SUS
14	0b RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
13	1b RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCie PIPE. We have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states. **Power Well:** SUS
12	1b RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to enable or not enable the host engine to generate a PME message. **Power Well:** SUS
11	1b RW	**Enable Isolation (EN_ISOL):** When set to '1' enable isolation **Power Well:** SUS
10	1b RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function. **Power Well:** SUS
9	0b RW	**Enable Core Clock Gating (EN_CORE_CG):** When set to '1' enable core clock gating based on low power state entered **Power Well:** SUS
8	0b RW	**Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle. **Power Well:** SUS
7	1b RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support **Power Well:** SUS
6	0b RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state. **Power Well:** SUS
5	1b RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering **Power Well:** SUS
4:1	0h RW	**Forced PM State (FORCED_PM_STATE):** Reserved. **Power Well:** SUS
0	0b RW	**Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1 **Power Well:** SUS

18.7.159 Port Watermark (HOST_CTRL_WATERMARK_REG)—Offset 80E8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 80E8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00800080h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

Fields: RBUF_WM (31:16), XBUF_WM (15:0)

Bit Range	Default & Access	Field Name (ID): Description
31:16	0080h RW	**RBUF water mark (RBUF_WM):** Reserved. **Power Well:** Core
15:0	0080h RW	**XBUF water mark (XBUF_WM):** Reserved. **Power Well:** Core

18.7.160 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG)—Offset 80ECh

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 80ECh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 18010600h

31			28				24				20				16				12				8				4				0
0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0

Fields: FORCE_LTSSM_ST, DL_LTSSM_ST, DL_U0, FORCED_CMP_PAT, EN_LES_CNT, DEBUG_MD_SEL, PHY_LP_LAT, LR_MIN_TM, LP_MIN_TM, FORCE_LA_PMC, DL_REC_U0, LINK_FTM, DIS_LINK_SCRAM, DL_U3_U0, DL_U2_U0, DL_U1_U0, EN_LINK_LB_MAST, DIS_LINK_CM

Bit Range	Default & Access	Field Name (ID): Description
31:27	03h RW	**Force LTSSM State (FORCE_LTSSM_ST):** LTSSM state to be forced This value is for test purpose only. **Power Well:** Core
26	0b RW	**Direct Link LTSSM State (DL_LTSSM_ST):** • 0 = Normal operation mode • 1 = Direct link to a specific state specified by bit 31:27 This bit is for test purposes only. It shall be written 0 in normal operation mode. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
25	0b RW	**Direct Link To U0 (DL_U0):** • 0 = Normal operation mode • 1 = Direct link to U0 This bit is for test purposes only. It shall be written 0 in normal operation mode. **Power Well:** Core
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT):** Compliance pattern to be forced to enter compliance mode This value is for test purpose only. **Power Well:** Core
20	0b RW	**Enable Link Error Slave Count (EN_LES_CNT):** • 0 = Disable link error slave count • 1 = Enable link error slave count **Power Well:** Core
19:17	0h RW	**Debug Mode Select (DEBUG_MD_SEL):** Reserved. **Power Well:** Core
16:15	2h RW	**PHY Low Power Latency (PHY_LP_LAT):** This field defines the latency to drive the PHY to enter low power mode. • 0 = 4 cycles • 1 = 8 cycles • 2 = 16 cycles • 3 = 32 cycles **Power Well:** Core
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM):** This value defines the minimum time for the link to stay in Recovery.Active other than from U3. The granuity is 128us. **Power Well:** Core
11:9	3h RW	**Link Polling Minimum Time (LP_MIN_TM):** This value defines the minimum time for the link to stay in Polling.Active and Recovery.Active from U3. The granuity is 128us. **Power Well:** Core
8	0b RW	**Force Link Accept PM Command (FORCE_LA_PMC):** • 0 = Normal operation mode • 1 = Force link to accept power management command **Power Well:** Core
7	0b RW	**Direct Link Recovery U0 (DL_REC_U0):** • 0 = Normal operation mode • 1 = Direct link to Recovery from U0 **Power Well:** Core
6	0b RW	**Link Fast Training Mode (LINK_FTM):** • 0 = Normal operation mode • 1 = Link fast training mode This bit should be written 0 in normal operation. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	**Disable Link Scrambler (DIS_LINK_SCRAM):** • 0 = Enable link scrambler • 1 = Disable link scramber **Power Well:** Core
4	0b RW	**Direct Link U3 From U0 (DL_U3_U0):** • 0 = Normal operation mode • 1 = Direct link to U3 from U0 This bit is for test purposes only. It shall be written 0 in normal operation mode. **Power Well:** Core
3	0b RW	**Direct Link U3 From U0 (DL_U2_U0):** • 0 = Normal operation mode • 1 = Direct link to U2 from U0 This bit is for test purposes only. It shall be written 0 in normal operation mode. **Power Well:** Core
2	0b RW	**Direct Link U3 From U0 (DL_U1_U0):** • 0 = Normal operation mode • 1 = Direct link to U1 from U0 This bit is for test purposes only. It shall be written 0 in normal operation mode. **Power Well:** Core
1	0b RW	**Enable Link Loopback Master Mode (EN_LINK_LB_MAST):** • 0 = Disable link loopback master mode • 1 = Enable link loopback master mode **Power Well:** Core
0	0b RW	**Disable Link Compliance Mode (DIS_LINK_CM):** • 0 = Enable link compliance mode • 1 = Disable link compliance mode **Power Well:** Core

18.7.161 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1)—Offset 80F0h

This set of registers is used to control the USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 80F0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 310003A0h

Bits	Default	Field
31:24	0 0 1 1 0 0 0 1	FSLS_SE0_DIS_DEL_7_0
23:18	0 0 0 0 0 0	RSVD

0	0	U2_ACC_SIM_TIM

Bit Range	Default & Access	Field Name (ID): Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred. **Power Well:** SUS
23:18	00h RW	**Reserved (RSVD):** Reserved. **Power Well:** SUS
17	0b RW	**EN_DETECT_NOMINAL_PKT_EOP:** • 0 = Detect minimal packet EOP. • 1 = Detect nominal packet EOP. **Power Well:** SUS
16	0b RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE):** • 0 = Normal • 1 = Force full speed on host ports (disable chirp response) **Power Well:** SUS
15	0b RW	**Disable 192 Byte Limit Check (DIS_192B_LIM):** • 0 = Enforce 192 byte limit on complete-split INs. Treat any packet) 192 as babble case. • 1 = Disable 192 byte limit check. **Power Well:** SUS
14	0b RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS):** • 0 = Internal FS/LS Disconnect from linestate(1:0) • 1 = External provided FS/LS Disconnect from hostdisconnect input **Power Well:** SUS
13:12	0h RW	**UTMI Reset Source Select (UTMI_RST_SEL):** Select UTMI Reset Source (FRD UTMI Reset Only) • 00 = HCReset or Force PHY Reset or internal reset after disconnect/suspend for restart (default) • 01,11 = UTMI reset = ~UTMI suspendm • 10 = UTMI reset = ~UTMI suspendm and synchronization to port clk. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
11	0b RW	**Disable HS Disconnect Window (DIS_HS_DIS_WIN):** • 0 = Enable HS Disconnect Window Function • 1 = Disable HS Disconnect Window Function **Power Well:** SUS
10	0b RW	**Disable Port Error Detection (DIS_PERR_DET):** • 0 = Enable Port Error Detection (default) • 1 = Disable Port Error Detection **Power Well:** SUS
9	1b RW	**Disable Peek Function for ISO-OUT (DIS_PF_IOUT):** • 0 = Enable Peek function for ISO-OUT (default) • 1 = Disable Peek function for ISO-OUT **Power Well:** SUS
8	1b RW	**Drive Resume-K FS/LS Serial Interface (DRV_RESK_FSLS_SER):** • 0 = Drive Resume-K on parallel Interface • 1 = Drive Resume-K directly on FS/LS Serial Interface (default) **Power Well:** SUS
7	1b RW	**Enable USB2 Drop-Ping (EN_U2_DROP_PING):** • 0 = Disable Drop-Ping Function in USB2 Protocol (default) • 1 = Enable Drop-Ping Function in USB2 Protocol **Power Well:** SUS
6	0b RW	**Enable USB2 Force-Ping (EN_U2_FORCE_PING):** • 0 = Disable Force-Ping Function in USB2 Protocol (default) • 1 = Enable Force-Ping Function in USB2 Protocol **Power Well:** SUS
5	1b RW	**Enable USB2 Auto-Ping (EN_U2_AUTO_PING):** • 0 = Disable Auto-Ping Function • 1 = Enable Auto-Ping Function in USB2 Protocol (default) **Power Well:** SUS
4	0b RW	**Disable PHY SuspendM (DIS_PHY_SUSM):** • 0 = PHY is suspend=U3,U2,disconnect (default) • 1 = Disable PHY SuspendM in All States **Power Well:** SUS
3	0b RW	**UTMI Internal Clock Gate Disable (UTMI_INT_CG_DIS):** • 0 = Normal operation (internal clock gated in U2,U3,disconnect) • 1 = UTMI Internal Clock Gate Disable **Power Well:** SUS
2	0b RW	**Disable PHY SuspendM in Disconnect State (DIS_PSUSM_DS):** • 0 = PHY is suspendM=0 in Disconnect State (default) • 1 = Disable PHY SuspendM in Disconnect State **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	**Force PHY Reset (FORCE_PHY_RST):** • 0 = Normal Operation (default) • 1 = Force PHY Reset **Power Well:** SUS
0	0b RW	**USB2 Accelerated Simulation Timing (U2_ACC_SIM_TIM):** • 0 = Normal Operation (default - FPGA/ASIC) • 1 = USB2 Accelerated Simulation Timing (default - simulation) **Power Well:** SUS

18.7.162 USB2 Port Link Control 2 (USB2_LINK_MGR_CTRL_REG2)—Offset 80F4h

This set of registers is used to control the USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 80F4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 80C40620h

31:28	0h RW	**RESERVED0 (RSVD0):** Reserved. **Power Well:** SUS
27:25	0h RW	**RESERVED (RSVD):** Reserved. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
24	1b RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCie core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. • 1 = enables this feature • 0 = disables this feature. **Power Well:** SUS
23	0b RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** • 1 = do not assert PLC for disconnection • 0 = assert PLC for disconnection **Power Well:** SUS
22	0b RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:** This bit enables a feature in PCie core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. • 1 = treat Logic IDLE as TS2 received when in some PCIe LTSSM state. • 0 = disable this feature. **Power Well:** SUS
21	1b RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. • 1 = disables p2 overwrite due to the D3HOT where PCIe core enters the L1. • 0 = enables P2 overwrite even if we are in D3Hot. **Power Well:** SUS
20	1b RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** • 1 = enables the port to enter U3 automatically when in U1/U2 • 0 = disables the port to enter U3 automatically when in U1/U2 **Power Well:** SUS
19	1b RW	**No linkdown reset is issued during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issued during low power state. **Power Well:** SUS
18	0b RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0:** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. • 1 = enable this feature • 0 = disable this feature **Power Well:** SUS
17	0b RW	**U2_EXIT_LFPS_TIMER_VALUE:** This bit selects U2 exit LFPS timer value. • 0 = 320ns 400ns in 25MHz domain • 1 = 240ns 320ns in 25MHz domain **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
16	1b RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP:** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. • 1 = enables this function • 0 = disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed. **Power Well:** SUS
15:14	0h RW	**P3_ENTRY_TIMEOUT:** This field defines the timeout value to enter P3 mode in U2. • 00 = 7us 8us • 01 = 511us 512us • 10 = disables the timer (0us) • 11 = disables the timer (0us) **Power Well:** SUS
13	0b RW	**Enable U2 P3 Mode (EN_U2_P3):** • 0 = Disable U2 P3 mode • 1 = Enable U2 P3 mode **Power Well:** SUS
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL):** Reserved. **Power Well:** SUS
10	0b RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1', enable core clock gating based on low power state entered **Power Well:** SUS
9	1b RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** • 0 = Enable USB3 port status change event generation if any change bit is not cleared • 1 = Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0 **Power Well:** SUS
8:4	00h RW	**Debug Mode Select Register (DEB_MODE_SEL):** Reserved. **Power Well:** SUS
3	0b RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1, enables the auto wakeup function when engine has identified non IDLE condition. **Power Well:** SUS
2	1b RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set to 1, enables the PM control module to transition to P1 instead of P0 upon exit from P2. **Power Well:** SUS
1	1b RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1, enables the PCIe PIPE CLK to be isolated when main power is removed. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1, enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
21:19	001b RW	**Min U3 Exit LFPS Duration (MIN_U3E_LFPS_D):** This field defines the minimum duration of LFPS driven by Host Controller upon U3 exit LFPS handshake. Note that there is an uncertainty of +-16us in actual duration driven by the Host Controller. • • 0b000 = 96us • 0b001 = 160us • 0b010 = 224us • 0b011 = 288us • 0b100 = 352us • 0b101 = 416us • 0b110 = 480us • 0b111 = 544us **Power Well:** SUS
18:16	001b RW	**Min U2 Exit LFPS Duration (MIN_U2_ELFPS_D):** This field defines the minimum duration of LFPS driven by Host Controller upon U2 exit LFPS handshake. Note that there is an uncertainty of +-16us in actual duration driven by the Host Controller. • 0b000 = 96us • 0b001 = 160us • 0b010 = 224us • 0b011 = 288us • 0b100 = 352us • 0b101 = 416us • 0b110 = 480us • 0b111 = 544us **Power Well:** SUS
15	0b RW	**Max PING LFPS Rx Detection (XHCI_MAX_PING_LFPS):** This field defines the maximum timing for PING LFPS. If an incoming LFPS will be considered a PING if it has a timing such that it is less than or equal to the selected value. Otherwise it will be considered for the other types of LFPS. • 0b Max PING LFPS timing set to 256 ns • (32 link clocks) • 1b Max PING LFPS timing set to 320 ns (40 link clocks) **Power Well:** SUSe
14:10	00h RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
9:0	032h RW	**xHCI BESL to HIRD Distance (XHCI_BESL_HIRD_DT):** This field defines the gap between BESL and duration of Resume signalling from Host upon Host Initiated Resume from USB2.0 LPM. The default value of this register corresponds to xHCI spec defined 50us value. • Value BESL to HIRD Distance • 000h = 0us • 001h = 1us • 002h = 2us • 3FFh = 1023us **Power Well:** SUS

Bits 63:4	Bit 3	Bits 2:0
DQP	RSVD	DESI

Bit Range	Default & Access	Field Name (ID): Description
63:4	000000000000000h RW	**Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the *Debug Capability Enable* field in the DCCTRL register to '1'. **Power Well:** Core
3	0b RW	**Reserved (RSVD):** Reserved. **Power Well:** Core
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. **Power Well:** Core

18.7.195 Debug Capability Control Register (DCCTRL)—Offset 84A0h

The *Debug Capability Control Register* is used to manage the Debug Capability.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 84A0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31	30:24	23:16	15:5	4	3	2	1	0
0	0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0
DCE	DADDR	DMBS	RSVD	DRC	HIT	HOT	LSE	DCR

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**Debug Capability Enable (DCE):** Setting this bit to a 1 enables xHCI USB Debug Capability operation. This bit is a 0 if the USB Debug Capability is disabled. Clearing this bit releases the Root Hub port assigned to the Debug Capability, and terminates any Debug Capability Transfer or Event Ring activity. **Power Well:** Core
30:24	00h RO	**Device Address (DADDR):** This field reports the USB device address assigned to the Debug Device during the enumeration process. This field is valid when the *DbC Run* bit is 1. **Power Well:** Core
23:16	00h RO	**Debug Max Burst Size (DMBS):** This field identifies the maximum burst size supported by the bulk endpoints of this DbC implementation. LPT-LP USB Debug Device does not support bursting. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
15:5	000h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
4	0b RW/C	**DbC Run Change (DRC):** This bit shall be set to '1' when DCR bit is cleared to '0', i.e. by any DbC Port State transition that exits the DbC-Configured state. While this bit is 1 the *Debug Capability Doorbell Register* (DCDB) is disabled. Software shall clear this bit to re-enable the DCDB. **Power Well:** Core
3	0b RW/S	**Halt IN TR (HIT):** While this bit is 1 the Debug Capability shall generate STALL TPs for all OUT DPs received for the IN TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information. **Power Well:** Core
2	0b RW/S	**Halt OUT TR (HOT):** While this bit is 1 the Debug Capability shall generate STALL TPs for all IN TPs received for the OUT TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information. **Power Well:** Core
1	0b RW	**Link Status Event Enable (LSE):** Setting this bit to a 1 enables the Debug Capability to generate Port Status Change Events due to the *Port Link Status Change* bit transitioning from a 0 to a 1. Refer to the xHCI USB specification for more information. **Power Well:** Core
0	0b RO	**DbC Run (DCR):** When 0, Debug Device is not in the Configured state. When 1, Debug Device is in the Configured state and bulk Data pipe transactions are accepted by Debug Capability and routed to the IN and OUT Transfer Rings. A 0 to 1 transition of the *Port Reset* (DCPORTSC:PR) bit will clear this bit to 0. **Power Well:** Core

18.7.196 Debug Capability Status Register (DCST)—Offset 84A4h

The *Debug Capability Status Register* reports capability related status information to software.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 84A4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DPNUM (31:24)	RSVD (23:1)	ERNE (0)

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port. **Power Well:** Core
23:1	000000h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
0	0b RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the *Debug Capability Event Ring Dequeue Pointer* register. **Power Well:** Core

18.7.197 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 84A8h

The fields of the *Debug Capability PORTSC Register* are defined below and provide information about the state of the Root Hub port that is assigned to the Debug Capability. Note that the fields in this register function differently than those in a normal *Port Status and Control Register* (described in section 5.4.8) because the Root Hub port assigned to the Debug Capability is acting as an Upstream Facing Port, not a Downstream Facing Port.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 84A8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

RSVD								CEC	PLC	PRC	RSVD_1			CSC	RSVD_2				PSPD				RSVD_3	PLS				PR	RSVD_4		PED	CCS

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
23	0b RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. • 0 = No change • 1 = Port Config Error detected Software shall clear this bit by writing a '1' to it. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
22	0b RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: • U0 -) U3 = Suspend signaling detected from Debug Host • U3 -) U0 = Resume complete • Polling -) Disabled = Training Error • Ux or Recovery -) Inactive = Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'. **Power Well:** Core
21	0b RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). • '0' = No change • '1' = Reset complete Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'. **Power Well:** Core
20:18	0h RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
17	0b RW/C	**Connect Status Change (CSC):** an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'. **Power Well:** Core
16:14	0h RO	**Reserved (RSVD_2):** Reserved. **Power Well:** Core
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases, this field shall indicate Undefined Speed. • 0 Undefined Speed • 1-15 Protocol Speed ID (PSI) Refer to the xHCI for USB specification for the definition of PSIs. Note: The Debug Capability does not support LS, FS, or HS operation. **Power Well:** Core
9	0b RO	**Reserved (RSVD_3):** Reserved. **Power Well:** Core
8:5	0h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). • 0 = Link is in the U0 State • 1 = Link is in the U1 State • 2 = Link is in the U2 State • 3 = Link is in the U3 State (Device Suspended) • 4 = Link is in the Disabled State • 5 = Link is in the RxDetect State • 6 = Link is in the Inactive State • 7 = Link is in the Polling State • 8 = Link is in the Recovery State • 9 = Link is in the Hot Reset State • 15:10 = Reserved Note: Transitions between different states are not reflected until the transition is complete. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	**Port Reset (PR):** • '1' = Port is in Reset • '0' = Port is not in Reset This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'. **Power Well:** Core
3:2	0h RO	**Reserved (RSVD_4):** Reserved. **Power Well:** Core
1	0b RW	**Port Enabled/Disabled (PED):** • '1' = Enabled. • '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. • 0 = Debug Capability Root Hub port is disabled. • 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note: This bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'. **Power Well:** Core
0	0b RO	**Current Connect Status (CCS):** • '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. • '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the *Connect Status Change* (CSC) field in the *Port Status Change Event* that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
63:4	000000000 000000h RW	**Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'. **Power Well:** Core
3:0	0h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

18.7.199 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 84B8h

The *Debug Capability Device Descriptor Register 1* identifies the Device Protocol and Vendor ID values that shall be reported by DbC in its Device Descriptor when it is enumerated by a Debug Host. Refer to section 9.6.1, Table 9-8 in the USB3 spec. This register shall be initialized before enabling the DbC (DCE = '1').

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 84B8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

7:0	00h RW	**Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space. **Power Well:** Core

18.7.202 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8538h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 8538h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:20, F:0] + 10h

Default: 00000000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: RSVD (31:19), EN_ACK_FCA (18), RSVD_1 (17:14), EN_ACK_FIFO_ICA (13), RSVD_2 (12:9), CL_OWN_CS (8), RET_OD_ACK_CR (7), RSVD_3 (6), RET_ODCF_SM_IS (5), RET_ODRF_SM_IS (4), RET_ODRDF_SM_IS (3), RSVD_4 (2:0)

Bit Range	Default & Access	Field Name (ID): Description
31:19	0000h RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
18	0b RW	**Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
13	0b RW	**Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP **Power Well:** Core
12:9	0h RO	**Reserved (RSVD_2):** Reserved. **Power Well:** Core
8	0b RW	**Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines **Power Well:** Core
7	0b RW	**Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports **Power Well:** Core
6	0b RO	**Reserved (RSVD_3):** Reserved. **Power Well:** Core
5	0b RW	**Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state **Power Well:** Core
4	0b RW	**Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state **Power Well:** Core
3	0b RW	**Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state **Power Well:** Core
2:0	0h RO	**Reserved (RSVD_4):** Reserved. **Power Well:** Core

18.8 USB EHCI PCI Configuration Registers

Table 214. Summary of USB EHCI PCI Configuration Registers—0/29/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–0h	1	"Vendor ID and Device ID (VID_DID)—Offset 0h" on page 2352	00008086h
4–4h	1	"Command and Device Status (CMD_STS)—Offset 4h" on page 2352	02900000h
8–Bh	4	"Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h" on page 2355	0C032000h
C–Fh	4	"Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch" on page 2356	00000000h
10–13h	4	"Memory Base Address (MBAR)—Offset 10h" on page 2357	00000000h
2C–2Fh	4	"USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID_SSID)—Offset 2Ch" on page 2358	00000000h
34–37h	4	"Capabilities Pointer and Reserved (CAP_PTR_RSVD)—Offset 34h" on page 2358	00000050h
3C–3Fh	4	"Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch" on page 2359	00000000h
50–53h	4	"PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h" on page 2359	C9C35801h
54–57h	4	"Power Management Control/Status (PM_CS)—Offset 54h" on page 2361	00000008h
58–5Bh	4	"Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h" on page 2362	20A0980Ah
60–63h	4	"Serial Bus Release Number and Frame Length Adjustment and Port Wake Capability (SBRN_FLA_PWC)—Offset 60h" on page 2363	07FF2020h
64–67h	4	"Port Disable Override and RMH Device Removable (PDO_RMHDR)—Offset 64h" on page 2364	00000000h
68–6Bh	4	"USB2 Legacy Support Extended Capability (ULSEC)—Offset 68h" on page 2365	00000001h
6C–6Fh	4	"USB2 Legacy Support Control/Status (ULSCS)—Offset 6Ch" on page 2366	00000000h
70–73h	4	"Intel-Specific USB2 SMI (ISU2SMI)—Offset 70h" on page 2369	00000000h
74–77h	4	"OverCurrent Mapping (OCMAP)—Offset 74h" on page 2371	C0300C03h
7C–7Fh	4	"EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWC)—Offset 7Ch" on page 2371	0000408Ch
F8–FBh	4	"Manufacturer's ID (MANID)—Offset F8h" on page 2374	00000F86h

18.8.1 Vendor ID and Device ID (VID_DID)—Offset 0h

Access Method

RSVD	VID_0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.
15:0	8086h RO	**Vendor ID (VID_0):** 16-bit field which indicates company vendor as Intel. **Power Well:** Core

18.8.2 Command and Device Status (CMD_STS)—Offset 4h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:29, F:0] + 4h

Default: 02900000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	1	0	1	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

31	30	29	28	27	26:25	24	23	22	21	20	19	18:11	10	9	8	7	6	5	4	3	2	1	0
DPE_0	SSE_0	RMA_0	RTA_0	STA_0	DEVT_0	MDPED_0	FBCAP_0	UDF_0	CLKCAP_0	CAPLIST_0	INTRSTS_0	RSVD	INTRDIS_0	FBE_0	SERREN_0	WCC_0	PER_0	VGAPS_0	PMWE_0	SCE_0	BME_0	MSE_0	IOSE_0

Bit Range	Default & Access	Field Name (ID): Description
31	0b RWC	**Detected Parity Error (DPE_0):** This bit is set whenever a parity error is seen on the internal interface to the USB2 host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a '1' to this bit location. **Power Well:** Core
30	0b RWC	**Signaled System Error (SSE_0):** This bit is set whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. The following conditions can cause the generation of SERR#: a parity error is seen on address, command, or data (if the data was targeting the EHC) on the internal interface to the USB2 host controller due to a parity error on the system interface and bit 6 of the Command register is set to 1. An EHC-initiated memory read results in a completion packet with a status other than successful on the system interface (if SERR on Aborts Enable is also set) Software clears this bit by writing a '1' to this bit location. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
29	0b RWC	**Received Master-Abort Status (RMA_0):** This bit is set when USB2, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location. **Power Well:** Core
28	0b RWC	**Received Target Abort Status (RTA_0):** This bit is set when USB2, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location. **Power Well:** Core
27	0b RO	**Signaled Target-Abort Status (STA_0):** This bit is used to indicate when the USB2 function responds to a cycle with a target abort. There is no reason for this to happen, so this bit will be hard-wired to '0'. Read-Only **Power Well:** Core
26:25	01b RO	**DEVSEL# Timing Status (DEVT_0):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only. **Power Well:** Core
24	0b RWC	**Master Data Parity Error Detected (MDPED_0):** This bit is set whenever a data parity error is detected on a USB2 read completion packet on the internal interface to the USB2 host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a '1' to this bit location. **Power Well:** Core
23	1b RO	**Fast Back-to-Back Capable (FBCAP_0):** Reserved as '1'. **Power Well:** Core
22	0b RO	**User Definable Features (UDF_0):** Reserved as '0' **Power Well:** Core
21	0b RO	**66 Mhz Capable (CLKCAP_0):** Reserved as '0' **Power Well:** Core
20	1b RO	**Capabilities List (CAPLIST_0):** Hardwired to '1' indicating that offset 34h contains a valid capabilities pointer. **Power Well:** Core
19	0b RO	**Interrupt Status (INTRSTS_0):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit. **Power Well:** Core
18:11	00000000b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
10	0b RW	**Interrupt Disable (INTRDIS_0):** When cleared to '0', the function is capable of generating interrupts. When '1', the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. This bit defaults to '0'. This bit is added as part of the PCI 2.3 Specification. **Power Well:** Core
9	0b RO	**Fast Back to Back Enable (FBE_0):** Reserved as '0'. **Power Well:** Core
8	0b RW	**SERR# Enable (SERREN_0):** on a memory read completion (if SERR on Aborts Enable is also set) Detection of an address or command parity error and the Parity Error Response bit is setDetection of a data parity error (when the data is going to the EHC) and the Parity Error Response bit is set **Power Well:** Core
7	0b RO	**Wait Cycle Control (WCC_0):** Reserved as '0'. **Power Well:** Core
6	0b RW	**Parity Error Response (PER_0):** When set to 1, the USB2 Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the EHCI specification. If it detects bad parity on the address or command phases when this bit is set to 1, the host controller does not take the cycle, halts the host controller (if currently not halted) and sets the host system error bit in the USBSTS register. Note that this applies to both requests and completions from the system interface. See section 9.19.2.4 for information regarding parity errors detected by the Prefetch DMA Engine. This bit must be set in order for the parity errors to generate SERR#. **Power Well:** Core
5	0b RO	**VGA Palette Snoop (VGAPS_0):** Reserved as '0' **Power Well:** Core
4	0b RO	**Postable Memory Write Enable (PMWE_0):** Reserved as '0' **Power Well:** Core
3	0b RO	**Special Cycle Enable (SCE_0):** Reserved as '0' **Power Well:** Core
2	0b RW	**Bus Master Enable (BME_0):** When set, bus mastering from EHCI is allowed, and will generate memory reads and writes for USB transfers. Notes on the EHC implementation: - Writes to change this bit occur immediately. Specifically, a write followed by a read will return the updated value. - When the BME bit is changed from 1 to 0, the EHC will cease accessing main memory within 2 microframes (250 usec). During this time, any number of reads and/or writes to memory may occur. - Clearing the BME bit shuts down the EHC DMA engines in the same manner that clearing the Run/Stop does. However, the schedule status bits and the HCHalted bit do not change based on the BME value. **Power Well:** Core
1	0b RW	**Memory Space Enable (MSE_0):** This bit controls access to the USB2 Memory Space registers. If this bit is set, accesses to the USB2 registers are enabled. The Base Address register for USB2 should be programmed before this bit is set. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
0	0b RO	**I/O Space Enable (IOSE_0):** Reserved as '0'. **Power Well:** Core

18.8.3 Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 8h

Default: 0C032000h

31			28				24				20				16				12				8				4				0
0	0	0	0	1	1	0	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
BCC_0								SCC_0								PI_0								RID_0							

Bit Range	Default & Access	Field Name (ID): Description
31:24	0Ch RO	**Base Class Code (BCC_0):** A value of 0Ch indicates that this is a Serial Bus controller. **Power Well:** Core
23:16	03h RO	**Sub Class Code (SCC_0):** A value of 03h indicates that this is a Universal Serial Bus Host Controller. **Power Well:** Core
15:8	20h RO	**Programming Interface (PI_0):** A value of 20h indicates that this USB2 Host Controller conforms to the EHCI specification. **Power Well:** Core
7:0	00h RO	**Revision ID (RID_0):** The value reported in this register indicates stepping of the host controller hardware. **Power Well:** Core

18.8.4 Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch

Reserved, for padding Master Latency Timer Header Type Reserved

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:29, F:0] + Ch

Default: 00000000h

Bits	31:24	23	22:16	15:8	7:0
Value	0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0
Field	RSVD	MFB_0	CFG_LYT_0	MLT_0	RSVD

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23	0b RO	**Multi Function Bit (MFB_0):** When set to 1 this indicates that this is a multifunction device. Default to 0 since EHCI is at function 0, no other function beyond. **Power Well:** Core
22:16	0000000b RO	**Configuration Layout (CFG_LYT_0):** Hardwired to 0 to indicate a standard PCI configuration layout. **Power Well:** Core
15:8	00h RO	**Master Latency Timer (MLT_0):** Because the USB2 controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0 **Power Well:** Core
7:0	00h RO	**Reserved (RSVD):** Reserved.

18.8.5 Memory Base Address (MBAR)—Offset 10h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BA_0 (31:10)	RSVD (9:4)	PFETCH_0 (3)	TYPE_0 (2:1)	RTE_0 (0)

Bit Range	Default & Access	Field Name (ID): Description
31:10	000000h RW	**Base Address (BA_0):** Bits (31:10) correspond to memory address signals (31:10), respectively. This gives 1 KB of relocatable memory space aligned to 1 KB boundaries. **Power Well:** Core
9:4	000000b RO	**Reserved (RSVD):** Reserved.
3	0b RO	**Prefetchable (PFETCH_0):** Read Only. This bit is hardwired to 0 indicating that this range should not be prefetched. **Power Well:** Core
2:1	00b RO	**Type (TYPE_0):** indicating that this range can be mapped anywhere within 32-bit address space. **Power Well:** Core
0	0b RO	**Resource Type Indicator (RTE_0):** Read Only. This bit is hardwired to 0 indicating that the base address field in this register maps to memory space **Power Well:** Core

18.8.6 USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID_SSID)—Offset 2Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

Bits 31:16	Bits 15:0
USB2SSID_0	USB2SVID_0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/L	**USB2 Subsystem ID (USB2SSID_0):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Writes should be done as a single 16-bit cycle. Reset: none **Power Well:** Core
15:0	0000h RW/L	**USB2 Subsystem Vendor ID (USB2SVID_0):** This register, in combination with the USB2 Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Reset: none **Power Well:** Core

18.8.7 Capabilities Pointer and Reserved (CAP_PTR_RSVD)—Offset 34h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 34h

Default: 00000050h

31	28	24	20	16	12	8	4	0
	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 1 0 1	0 0 0 0

Bits 31:8	Bits 7:0
RSVD	CAP_PTR_0

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	50h RO	**Capabilities Pointer (CAP_PTR_0):** This register points to the starting offset of the USB2 capabilities ranges. **Power Well:** Core

18.8.8 Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 3Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																IPIN_0								ILINE_0							

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.
15:8	00h RO	**Interrupt Pin (IPIN_0):** Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. NOTE: As a single function device, only INTA# may be used while the other three interrupt lines have no meaning. (refer to PCI 3.0 spec section 2.2.6 Interrupt Pins) **Power Well:** Core
7:0	00h RW	**Interrupt line (ILINE_0):** This data is not used by the SOC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. Reset: core well and D3-to-D0. **Power Well:** Core

18.8.9 PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h

PCI Power Management Capabilities ID Next Item Pointer #1 Power Management Capabilities

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 50h

Default: C9C35801h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	0	1	0	0	1	1	1	0	0	0	0	1	1	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	1
RSVD					D2SUP_0	D1SUP_0	AUXCUR_0			DSI_0	RSVD	PMECLK_0	VERS_0			PM_NEXT_0								PM_CID_0							

Bit Range	Default & Access	Field Name (ID): Description
31:27	11001b RO	**Reserved (RSVD):** Reserved.
26	0b RO	**D2_Support (D2SUP_0):** The D2 state is not supported. Reset: core well, but not D3-to-D0. **Power Well:** Core
25	0b RO	**D1_Support (D1SUP_0):** The D1 state is not supported. Reset: core well, but not D3-to-D0. **Power Well:** Core
24:22	111b RW/L	**Aux_Current (AUXCUR_0):** The USB2 SIP EHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. **Power Well:** Core
21	0b RO	**DSI (DSI_0):** The Intel EHC reports 0, indicating that no device-specific initialization is required. Reset: core well, but not D3-to-D0. **Power Well:** Core
20	0b RO	**Reserved (RSVD):** Reserved.
19	0b RO	**PME Clock (PMECLK_0):** The Intel EHC reports 0, indicating that no PCI clock is required to generate PME#. Reset: core well, but not D3-to-D0. **Power Well:** Core
18:16	011b RW/L	**Version (VERS_0):** Version: The Intel EHC reports 011, indicating that it complies with Revision 1.21 of the PCI Power Management Specification. Note: As contigency plan, the bit can be reverted by BIOS to 010b to support PCI PM Revision 1.1, by manipulating the offset80h Access Control register's WRT_RDONLY bit. **Power Well:** Core
15:8	58h RW/L	**Next Item Pointer #1 (PM_NEXT_0):** This register defaults to 58h, which indicates that the next capability registers begin at configuration offset 58h. This register is writable when the WRT_RDONLY bit is set. This allows BIOS to effectively hide the Debug Port capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of 58h implies Debug Port and FLR capabilities visible 98h implies Debug Port invisible, next capability is FLR 00h implies that both Debug port and FLR capability are hidden Note that this value is never expected to be programmed. Reset: core well, but not D3-to-D0 **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
7:0	01h RO	**PCI Power Management Capability ID (PM_CID_0):** A value of 01h indicates that this is a PCI Power Management capabilities field. **Power Well:** Core

18.8.10 Power Management Control/Status (PM_CS)—Offset 54h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 54h

Default: 00000008h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
RSVD																PMESTS_0	DTScl_0		DTSel_0				PMEEN_0	RSVD				NO_SOFT_RESET	RSVD	PWRST_0	

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.
15	0b RWC	**PME_Status (PMESTS_0):** This bit is set when the EHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded. **Power Well:** Resume
14:13	00b RO	**Data_Scale (DTScl_0):** because it does not support the associated Data register. **Power Well:** Resume
12:9	0h RO	**Data_Select (DTSel_0):** because it does not support the associated Data register. **Power Well:** Resume
8	0b RW	**PME_En (PMEEN_0):** A '1' enables the EHC to generate an internal PME signal when PME_Status is '1'. This bit must be explicitly cleared by the operating system each time it is initially loaded. **Power Well:** Resume
7:4	0000b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	1b RO	**No Soft Reset (NO_SOFT_RESET):** A '0' indicates device does perform an internal reset upon D3hot to D0 transition via software control of the PowerState bits. Configuration Context is lost. Full re-initialization sequence is needed to return the device to D0 Initialized.(Default to '1') Note: As contigency plan, the bit can be reverted by BIOS to 0, by manipulating the offset80h Access Control register?s WRT_RDONLY bit. **Power Well:** Resume
2	0b RO	**Reserved (RSVD):** Reserved.
1:0	00b RW	**PowerState (PWRST_0):** This 2-bit field is used both to determine the current power state of EHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3hot state, the accesses to the EHC memory range must not be accepted; but the configuration space must still be accessible. When not in the D0 state, the generation of the interrupt output is blocked. Specifically, the PIRQ[H] is not asserted when not in the D0 state. When software changes this value from the D3hot state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function. **Power Well:** Resume

18.8.11 Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:29, F:0] + 58h

Default: 20A0980Ah

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RWC	**SMI on PortOwner (SMIonPO1_0):** Bits 29:22 correspond to the Port Owner bits for ports 1 (22) through 8 (29). These bits are set to '1' whenever the associated Port Owner bits transition from 0-)1 or 1-)0. Software clears these bits by writing a one. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
21	0b RWC	**SMI on PMCSR (SMIonPMCSR_0):** This bit is set to '1' whenever software modifies the Power State bits in the Power Management Control/Status register. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
20	0b RWC	**SMI on Async (SMIonAsync_0):** This bit is set to '1' whenever the Async Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
19	0b RWC	**SMI on Periodic (SMIonPeriodic_0):** This bit is set to '1' whenever the Periodic Schedule Enable bit transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
18	0b RWC	**SMI on CF (SMIonCF_0):** This bit is set to '1' whenever the Configure Flag transitions from 1-)0 or 0-)1. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
17	0b RWC	**SMI on HCHalted (SMIonHCHalted_0):** This bit is set to '1' whenever HCHalted transitions to '1' as a result of the Run/Stop bit being cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
16	0b RWC	**SMI on HCReset (SMIonHCRst_0):** This bit is set to '1' whenever HCRESET transitions to '1'. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
15:6	000h RW	**SMI on PortOwner Enable (SMIonPOEn_0):** When any of these bits are '1' and the corresponding SMI on PortOwner bits are '1', then the host controller will issue an SMI. Unused ports should have their corresponding bits cleared. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
5	0b RW	**SMI on PMSCR Enable (SMIonPMSCREn_0):** When this bit is '1' and SMI on PMSCR is '1', then the host controller will issue an SMI. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
4	0b RW	**SMI on Async Enable (SMIonAsyncEn_0):** When this bit is '1 and SMI on Async is '1' , then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
3	0b RW	**SMI on Periodic Enable (SMIonPeriodicEn_0):** When this bit is '1 and SMI on Periodic is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
2	0b RW	**SMI on CF Enable (SMIonCFEn_0):** When this bit is '1' and SMI on CF is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
1	0b RW	**SMI on HCHalted Enable (SMIonHCHaltedEn_0):** When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume
0	0b RW	**SMI on HCReset Enable (SMIonHCRstEn_0):** When this bit is a '1' and SMI on HCHalted is '1', then the host controller will issue an SMI. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition **Power Well:** Resume

18.8.17 OverCurrent Mapping (OCMAP)—Offset 74h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:29, F:0] + 74h

Default: C0300C03h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCMAPD_0								OCMAPC_0								OCMAPB_0								OCMAPA_0							

Bit Range	Default & Access	Field Name (ID): Description
31:24	C0h RW	**OC Mapping D (OCMAPD_0):** Each bit position maps OC4, for EHCI1 to a set of ports as follows: The OC4 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. **Power Well:** Resume
23:16	30h RW	**OC Mapping C (OCMAPC_0):** OC Mapping C. Each bit position maps OC3, for EHCI1 to a set of ports as follows: The OC3 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. **Power Well:** Resume
15:8	0Ch RW	**OC Mapping B (OCMAPB_0):** OC Mapping B. Each bit position maps OC2, for EHCI1 to a set of ports as follows: The OC2 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. **Power Well:** Resume
7:0	03h RW	**OC Mapping A (OCMAPA_0):** OC Mapping A: Each bit position maps OC1, for EHCI1 to a set of ports as follows: The OC1 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin. **Power Well:** Core

18.8.18 EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWC)—Offset 7Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:29, F:0] + 7Ch

Default: 0000408Ch

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0	1	1	0	0
RSVD							RMHIEWCS_0	RSVD				RMHUWDR_0	RMHUWOCD_0	RMHUWDD_0	RMHUWCE_0	RSVD	RSVD	RSVD	RSVD	RSVD		RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD	RSVD

Bit Range	Default & Access	Field Name (ID): Description
31:25	0000000b RO	**Reserved (RSVD):** Reserved.
24	0b RW	**RMH Inherit EHCI Wake Control Settings (RMHIEWCS_0):** When this bit is set, the RMH behaves as if bits 2:0 of this register reflect the appropriate bits of EHCI PORTSC0 bits 22:20. **Power Well:** Resume
23:20	0000b RO	**Reserved (RSVD):** Reserved.
19	0b RW	**RMH Upstream Wake on Device Resume (RMHUWDR_0):** This bit governs the hub behavior when globally suspended. When this bit is 0 it enables the port to be sensitive to device initiated resume events as system wake-up events. i.e, the hub will initiate a resume on its upstream port and cause a wake when a device resume occurs on an enabled DS port When this bit is set to 1 and a device resume event is seen on a downstream port, the hub does not initiate a wake upstream and does not cause a wake. **Power Well:** Resume
18	0b RW	**RMH Upstream Wake on OC Disable (RMHUWOCD_0):** This bit governs the hub behavior when globally suspended. When this bit is 0 it enables the port to be sensitive to overcurrent conditions as system wake-up events. i.e,, the hub will initiate a resume on its upstream port and cause a wake when an OC condition occurs on an enabled DS port When this bit is set to 1 and an over current event is seen, the hub does not initiate a wake upstream and does not cause a wake. **Power Well:** Resume
17	0b RW	**RMH Upstream Wake on Disconnect Disable (RMHUWDD_0):** This bit governs the hub behavior when globally suspended. When this bit is set to 0, the globally suspended hub treats disconnect events on downstream port as resume events to be propagated upstream. In this case, it is allowed to initiate a wake on its upstream por and cause a system wake in response to a disconnect event on a downstream port When this bit is set to 1, and the hub is globally suspended, the hub does not initiate a resume on its upstream port or cause a resume when a disconnect event occurs on a downstream port. **Power Well:** Resume
16	0b RW	**RMH Upstream Wake on Connect Enable (RMHUWCE_0):** This bit governs the hub behavior when globally suspended. When this bit is set to 0, and the hub is globally suspended, the hub treats connect events on a downstream port as resume events to be propagated upstream. As well as waking up the system. When this bit is set to 1,and the hub is globally suspended, the hub does not wake the system nor does it initiate a resume on its upstream port when a connect event occurs on a downstream port. **Power Well:** Resume

18.9.1 Capability Registers Length and HC Interface Version Number (CAP_HCIV)—Offset 0h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 01000020h

31	28	24	20	16	12	8	4	0

0 0 0 0 | 0 0 0 1 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 1 0 | 0 0 0 0

Bits 31:16	Bits 15:8	Bits 7:0
HCIVERSION_B0_0	RSVD	CAPLENGTH_0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0100h RO	**Host Controller Interface Version Number (HCIVERSION_B0_0):** This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms. **Power Well:** Core
15:8	00h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	20h RO	**Capability Registers Length (CAPLENGTH_0):** This register is used as an offset to add to the Memory Base Register to find the beginning of the Operational Register Space. This is fixed at 20h, indicating that the Operation Registers begin at offset 20h. **Power Well:** Resume

18.9.2 Host Controller Structural Parameters (HCSPARAMS)—Offset 4h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00200008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
RSVD								DP_N_0				RSVD			RSVD	N_CC_0				N_PCC_0				PRR_0	RSVD		RSVD	NPORTS_0			

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved (RSVD):** Reserved.
23:20	2h RO	**Debug Port Number (DP_N_0):** Hardwired to 2h, indicating that the Debug Port is on the 2nd port on the EHC. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset) **Power Well:** Resume
19:17	000b RO	**Reserved (RSVD):** Reserved.
16	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Number of Companion Controllers (N_CC_0):** This field indicates the number of companion controllers associated with this USB 2.0 host controller. A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports. A value larger than one in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports. There are no companion controllers. This field is set to '0' as Read-Only bit. **Power Well:** Core
11:8	0h RO	**Number of Ports per Companion Controller (N_PCC_0):** This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. Read-Only. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset) **Power Well:** Core
7	0b RO	**Port Routing Rules (PRR_0):** This field indicates the method used by this implementation for how all ports are mapped to companion controllers. This is hardwired to 0, indicating that the first N_PCC (=2) ports are routed to the lowest numbered function companion host controller, the next N_PCC ports are routed to the next lowest function companion controller, and so on **Power Well:** Resume
6:5	00b RO	**Reserved (RSVD):** Reserved.
4	0b RO	**Reserved (RSVD):** Reserved.
3:0	8h RW	**N_PORTS (NPORTS_0):** This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1H to FH. The default value for the EHCI controller indicates 8 ports. BIOS may overwrite the default value to properly describe the board or chip SKU . (please refer to RMH Configuration Details in section 1.23.2). A zero in this field is undefined. Integrated RMH - If USBr is disabled, this should be updated by BIOS to 2 such that the EHC reports 2ports to be default, port 0 assigned to the RMH and port 1 assigned to the debug device. If USB-R is enabled, the number reported should be updated to 3 by BIOS (port 2 will be assigned to USB-R in this case) Legacy Mode - The default value for the EHCI controller indicates 8 ports. If USB-R support is enabled, BIOS should account for the additional ports in calculating the value to write to this field. **Power Well:** Resume

18.9.3 Host Controller Capability Parameters (HCCPARAMS)—Offset 8h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + 8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00036881h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0	1
RSVD														ASPFC_0	PSPFC_0	EECP_0								IST_0				RSVD	ASPC_0	PFLF_0	AC64_0

Bit Range	Default & Access	Field Name (ID): Description
31:18	00000000000000b RO	**Reserved (RSVD):** Reserved.
17	1b RW	**Asynchronous Schedule Prefetch Capability (ASPFC_0):** This bit indicates that tthe hardware support the Asynch schedule prefetch enable bit in the USB command register. **Power Well:** Resume
16	1b RW	**Periodic Schedule Prefetch Capability (PSPFC_0):** This bit indicates that the EHC hardware supports the Periodic Schedule prefetch bit in the USB2 Command Register. **Power Well:** Core
15:8	68h RO	**EHCI Extended Capabilities Pointer (EECP_0):** This field is hardwired to 68h, indicating that the EHCI capabilities list exists and begins at offset 68h in the PCI configuration space. **Power Well:** Resume
7:4	8h RO	**Isochronous Scheduling Threshold (IST_0):** This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. Refer to the EHCI specification for details on how software uses this information for scheduling isochronous transfers. The Intel USB2 hardwires this field to 8h. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
3	0b RO	**Reserved (RSVD):** Reserved.
2	0b RO	**Asynchronous Schedule Park Capability (ASPC_0):** This bit is hardwired to 0 indicating that the Host Controller does not support this optional feature. **Power Well:** Resume
1	0b RO	**Programmable Frame List Flag (PFLF_0):** If this bit is set to a zero, then system software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. If set to a one, then system software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K page boundary. This requirement ensures that the frame list is always physically contiguous. The Intel EHC does not support different frame list lengths. This bit is read-only '0'. **Power Well:** Core
0	1b RO	**64-bit Addressing Capability (AC64_0):** This field documents the addressing range capability of this implementation. The value of this field determines whether software should use the 32-bit or 64-bit data structures. Values for this field have the following interpretation:0b data structures using 32-bit address memory pointers; 1b data structures using 64-bit address memory pointers The USB2 SIP supports 64-bit addressing only. This bit is read-only '1'. **Power Well:** Resume

18.9.4 USB2 Command Register (USB2CMD)—Offset 20h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 20h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00080000h

Bits	31:24	23:16	15:14	13	12	11:8	7	6	5	4	3:2	1	0

13	0b RO	**Reserved (RSVD):** Reserved.
12	0h RO	**Reserved (RSVD):** Reserved.
11:8	0h RO	**Unimplemented Asynchronous Park Mode Bits (UAPMB_0):** This field is hardwired to 000b because the host controller does not support this optional feature. **Power Well:** Core
7	0b RO	**Light Host Controller Reset (LHCR_0):** Read Only 0b. The Intel EHC does not implement this optional reset and hardwires this bit to 0. **Power Well:** Core
6	0b RW	**Interrupt on Async Advance Doorbell (IAAD_0):** This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state , it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. See the EHCI specification for operational details. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	**Asynchronous Schedule Enable (ASE_0):** This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0b Do not process the Asynchronous Schedule 1b Use the ASYNCLISTADDR register to access the Asynchronous Schedule. **Power Well:** Core
4	0b RW	**Periodic Schedule Enable (PSE_0):** This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0b Do not process the Periodic Schedule 1b Use the PERIODICLISTBASE register to access the Periodic Schedule. **Power Well:** Core
3:2	00b RO	**Frame List Size (FLS_0):** This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. . This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean:00b 1024 elements (4096 bytes) Default value; 01b 512 elements (2048 bytes); 10b 256 elements (1024 bytes) - for resource-constrained environments **Power Well:** Core
1	0b RW	**Host Controller Reset (HCRESET_0):** This control bit used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Note: PCI Configuration registers and Host Controller Capability Registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Port ownership will be disowned by the host controller(s), with the side effects described in the EHCI spec. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior. This reset must be used to leave EHCI port test modes. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
0	0b RW	**Run/Stop (RS_0):** 1=Run. 0=Stop. When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 microframes after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software should not write a 1 to this field unless the host controller is in the Halted state (i.e. HCHalted in the USBSTS register is a one). The following table explains how the different combinations of Run and Halted must be interpreted: Run/Stop Halted Interpretation 0 0 Valid- in the process of halting 0 1 Valid- halted 1 0 Valid- running 1 1 Invalid- the HCHalted bit clears immediately Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being cleared (and also affect the Host Error bit). **Power Well:** Core

18.9.5 USB2 Status (USB2STS)—Offset 24h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + 24h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00001000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
RSVD																ASS_0	PSS_0	RECL_0	HCHALT_0	RSVD						IAA_0	HSE_0	FLR_0	PCD_0	USBERRINT_0	USBINT_0

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0b RO	**Asynchronous Schedule Status (ASS_0):** This bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0). **Power Well:** Core
14	0b RO	**Periodic Schedule Status (PSS_0):** This bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it currently has a request pending, in addition to the regular Periodic DMA engine. **Power Well:** Core
13	0b RO	**Reclamation (RECL_0):** This is a read-only status bit, which is used to detect an empty asynchronous schedule. The operational model and valid transitions for this bit are described in Section 4 of the EHCI Specification. **Power Well:** Core
12	1b RO	**HCHalted (HCHALT_0):** This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it is currently has a request pending, in addition to the regular DMA engines. **Power Well:** Core
11:6	000000b RO	**Reserved (RSVD):** Reserved.
5	0b RWC	**Interrupt on Async Advance (IAA_0):** System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4	0b RWC	**Host System Error (HSE_0):** The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being set. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs. A hardware interrupt is generated to the system (if enabled in the Interrupt Enable Register). **Power Well:** Core
3	0b RWC	**Frame List Rollover (FLR_0):** The Host Controller sets this bit to a one when the Frame List Index (see Section 9.3.2.4) rolls over from its maximum value to zero. Since the USB2 SIP only supports the 1024-entry Frame List Size, the Frame List Index rolls over every time FRNUM[13] toggles. **Power Well:** Core
2	0b RWC	**Port Change Detect (PCD_0):** The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a zero to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change). Regardless of the implementation, whenever this bit is readable (i.e., in the D0 state), it must provide a valid view of the Port Status registers. **Power Well:** Core
1	0b RWC	**USB Error Interrupt (USBERRINT_0):** The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and Bit 0 are set. See the EHCI specification for a list of the USB errors that will result in this interrupt being asserted. **Power Well:** Core
0	0b RWC	**USB Interrupt (USBINT_0):** The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes). **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set. **Power Well:** Resume
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0). **Power Well:** Resume
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1). **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one. **Power Well:** Resume
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior. **Power Well:** Resume
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details. **Power Well:** Resume
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power. **Power Well:** Resume
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared. **Power Well:** Resume
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. **Power Well:** Resume
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner. **Power Well:** Resume
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'. **Power Well:** Resume
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it. **Power Well:** Resume
2	0b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it. **Power Well:** Resume
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0). **Power Well:** Resume
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1). **Power Well:** Resume
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one. **Power Well:** Resume
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior. **Power Well:** Resume
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power. **Power Well:** Resume
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset **Power Well:** Resume
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. **Power Well:** Resume
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. **Power Well:** Resume
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'. **Power Well:** Resume
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it. **Power Well:** Resume
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it. **Power Well:** Resume
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. **Power Well:** Resume

The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one. **Power Well:** Resume
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior. **Power Well:** Resume
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power. **Power Well:** Resume
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset **Power Well:** Resume
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. **Power Well:** Resume
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. **Power Well:** Resume
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'. **Power Well:** Resume
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it. **Power Well:** Resume
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it. **Power Well:** Resume
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. **Power Well:** Resume

Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. **Power Well:** Resume
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. **Power Well:** Resume
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'. **Power Well:** Resume
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it. **Power Well:** Resume
2	0b RO	**Reserved (RSVD):** Reserved.
1	0b RWC	**Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it. **Power Well:** Resume
0	0b RO	**Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. **Power Well:** Resume

31:23	000h RO	**Reserved (RSVD):** Reserved.
22	0b RW	**Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set. **Power Well:** Resume
21	0b RW	**Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0). **Power Well:** Resume
20	0b RW	**Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1). **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one. **Power Well:** Resume
15:14	00b RW	**Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior. **Power Well:** Resume
13	1b RW	**Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details. **Power Well:** Resume
12	1b RO	**Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power. **Power Well:** Resume
11:10	00b RO	**Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
9	0b RO	**Reserved (RSVD):** Reserved.
8	0b RW	**Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared. **Power Well:** Resume
7	0b RW	**Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. **Power Well:** Resume

Bit Range	Default & Access	Field Name (ID): Description
6	0b RW	**Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. **Power Well:** Resume
5	0b RWC	**Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner. **Power Well:** Resume
4	0b RO	**Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'. **Power Well:** Resume
3	0b RWC	**Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it. **Power Well:** Resume
2	0b RO	**Reserved (RSVD):** Reserved.

31	0b RO	**Reserved (RSVD):** Reserved.
30	0b RW	**OWNER_CNT (OWNERCNT_0):** When software writes a 1 to this bit, the ownership of the debug port is forced to the EHCI controller (i.e. immediately taken away from the companion Classic USB Host Controller) If the port was already owned by the EHCI controller, then setting this bit has no effect. This bit overrides all of the ownership-related bits in the standard EHCI registers. Note that the value in this bit does not affect the value reported in the PORTSC Port Owner bit. **Power Well:** Core
29	0b RO	**Reserved (RSVD):** Reserved.
28	0b RW	**ENABLED_CNT (ENABLEDCNT_0):** This bit = 1 if the debug port is enabled for operation. Software can clear this by writing a zero to it. The hardware clears the bit for the same conditions where hardware clears the Port Enable/Disable bit (in the PORTSC register). (Note this bit is not cleared when software clears the Port Enabled/Disabled bit in the PORTSC.) Software can directly set this bit if the port is already enabled in the associated Port Status and Control register (this is enforced by the hardware). Reset default = 0. **Power Well:** Core
27:17	00000000000b RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
16	0b RWC	**DONE_STS (DONESTS_0):** Read/Write-Clear. This bit is set by hardware to indicate that the request is complete. Writing a 1 to this bit will clear it if it is set. Writing a 0 to this bit has no effect. Reset default = 0 **Power Well:** Core
15:12	0000b RO	**LINK_ID_STS (LINKIDSTS_0):** Read-Only. This field identifies the link interface. It is hardwired to 0h to indicate that it is a USB Debug Port. **Power Well:** Core
11	0b RO	**Reserved (RSVD):** Reserved.
10	0b RO	**IN_USE_CNT (INUSECNT_0):** Set by software to indicate that the port is in use. Cleared by software to indicate that the port is free and may be used by other software. This bit is cleared after reset. (This bit has no affect on hardware.) **Power Well:** Core
9:7	000b RO	**EXCEPTION_STS (EXCP_STS_0):** Read-Only. This field indicates the exception when the ERROR_GOOD#_STS bit is set. This field should be ignored if the ERROR_GOOD#_STS bit is 0. 000 No Error. Note: this should not be seen, since this field should only be checked if there is an erro. 001 Transaction error: indicates the USB2 transaction had an error (CRC, bad PID, timeout, etc.) 010 HW error. Request was attempted (or in progress) when port was suspended or reset. All Others are reserved Reset default = 000b **Power Well:** Core
6	0b RO	**ERROR_GOOD_STS (ERRGOODSTS_0):** Read-Only. The hardware clears this bit to 0 upon the proper completion of a read or write. The hardware sets this bit to indicate that an error has occurred. Details on the nature of the error are provided in the Exception field. Reset default = 0. **Power Well:** Core
5	0b RW	**GO_CNT (GOCNT_0):** Software sets this bit to cause the hardware to perform a read or write request. Writing a 0 to this bit has no effect. Writing a 1 to this bit when it is already set may result in undefined behavior. When set, the hardware clears this bit when the hardware sets the DONE_STS bit. Reset default = 0. **Power Well:** Core
4	0b RW	**WRITE_READ_CNT (WRRDCNT_0):** Software sets this bit to indicate that the current request is a write. Software clears this bit to indicate that the current request is a read. Reset default = 0. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
3:0	0000b RW	**DATA_LEN_CNT (DATALENCNT_0):** This field is used to indicate the size of the data to be transferred. Reset default = 0h. For write operations, this field is set by software to indicate to the hardware how many bytes of data in Data Buffer are to be transferred to the console. A value of 0h indicates that a zero-length packet should be sent. A value of 1-8 indicates 1-8 bytes are to be transferred. Values 9-Fh are illegal and how hardware behaves if used is undefined. For read operations, this field is set by hardware to indicate to software how many bytes in Data Buffer are valid in response to a read operation. A value of 0h indicates that a zero length packet was returned and the state of Data Buffer is not defined. A value of 1-8 indicates 1-8 bytes were received. Hardware is not allowed to return values 9-Fh. The transferring of data always starts with byte 0 in the data area and moves toward byte 7 until the transfer size is reached. **Power Well:** Core

18.9.21 USB PIDs Register (DP_USB_PIDs)—Offset A4h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [MBAR] + A4h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00000000h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Default	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
Field	RSVD		RECEIVED_PID_STS_0		SEND_PID_CNT_0		TOKEN_PID_CNT_0	

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:16	00h RO	**RECEIVED_PID_STS (RECEIVED_PID_STS_0):** The hardware updates this field with the received PID for transactions in either direction. When the controller is writing data, this field is updated with the handshake PID that is received from the device. When the host controller is reading data, this field is updated with the data packet PID (if the device sent data), or the handshake PID (if the device NAKs the request). This field is valid when the hardware clears the GO_DONE#_CNT bit. Reset Default = 0. **Power Well:** Core
15:8	00h RW	**SEND_PID_CNT (SEND_PID_CNT_0):** The hardware sends this PID to begin the data packet when sending data to USB (ie. WRITE_READ#_CNT is asserted). Software will typically set this field to either DATA0 or DATA1 PID values. Reset Default = 0 **Power Well:** Core
7:0	00h RW	**TOKEN_PID_CNT (TOKEN_PID_CNT_0):** The hardware sends this PID as the Token PID for each USB transaction. Software will typically set this field to either IN, OUT or SETUP PID values. Reset Default = 0. **Power Well:** Core

18.9.22 Debug Port Data Buffer Bytes 7:0 (DP_DATA_BUF_B)—Offset A8h

Access Method

Type: Memory Mapped I/O Register (Size: 64 bits)

Offset: [MBAR] + A8h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 0000000000000000h

63	60	56	52	48	44	40	36	32	28	24	20	16	12	8	4	0

0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000 0000

DATABUFFER_0

Bit Range	Default & Access	Field Name (ID): Description
63:0	0000000000000000h RW	**DATABUFFER (DATABUFFER_0):** These are the 8 bytes of the data buffer. Bits 7:0 correspond to least significant byte (byte 0). Bits 63:56 correspond to the most significant byte (byte 7). The bytes in the Data Buffer must be written with data before software initiates a write request. For a read request, the Data Buffer contains valid data when DONE_STS is set by the hardware, ERROR_GOOD#_STS is cleared by the hardware, and the DATA_LENGTH_CNT field indicates the number of bytes that are valid. Reset Default = 0. **Power Well:** Core

18.9.23 Debug Port Config Register (DP_CFG)—Offset B0h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [MBAR] + B0h

MBAR Type: PCI Configuration Register (Size: 32 bits)
MBAR Reference: [B:0, D:29, F:0] + 10h

Default: 00007F01h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	0	0	0	0	0	0	0	1

Fields: RSVD (31:15), USB_ADDR_CNF_0 (14:8), RSVD (7:4), USB_ENDPT_CNF_0 (3:0)

Bit Range	Default & Access	Field Name (ID): Description
31:15	000000000 00000000b RO	**Reserved (RSVD):** Reserved.
14:8	7fh RW	**USB_ADDRESS_CNF (USB_ADDR_CNF_0):** 7-bit field that identifies the USB device address used by the controller for all Token PID generation. This is a R/W field that is set to 7Fh after reset **Power Well:** Core
7:4	0000b RO	**Reserved (RSVD):** Reserved.
3:0	01h RW	**USB_ENDPOINT_CNF (USB_ENDPT_CNF_0):** This 4-bit field identifies the endpoint used by the controller for all Token PID generation. This is a R/W field that is set to 01h after reset. **Power Well:** Core

18.9.24 USB Test Per Port Register 1 (USB2_TEST_PERPORT_REG1_LANE0/1/2/3) - Offset 4113h/4213h/4313h/4413h

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x43] + 4113h/4213h/4313h/4413h

Op Codes: 6h - Read, 7h – Write

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	Reserved.
8	0x0 RW	This register field is used in the workaround in the erratum VL184. It is Reserved for all other purposes.

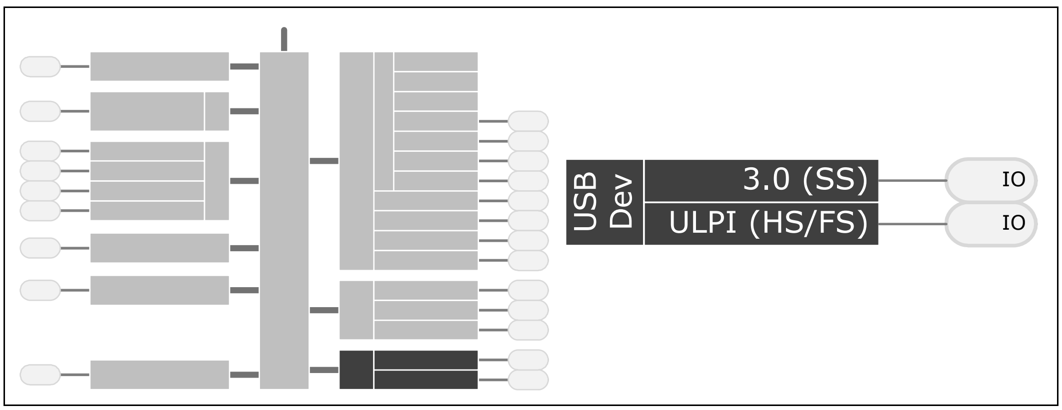
19 USB Device Controller Interfaces (3.0, ULPI)

The SoC implements a single USB 3.0 device controller, where the platform acts as a peripheral to another device or another PC.

The USB Device controller supports connections at Super Speed (3.0) on the USB3DEV interface, and High and Full speeds (2.0/1.x) on the ULPI interface. To support High and Full Speed devices on ULPI, an external PHY is required.

Note: The ULPI interface must be implemented even if only SuperSpeed support is required. The USB3DEV interface will not operate if the ULPI interface is disabled.



19.0.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 217. USB 3.0 Device Signals

Signal Name	Direction Plat. Power	Description
USB3DEV_RXP/N[0]	I V1P0S	**Data In:** High speed serialized data inputs
USB3DEV_TXP/N[0]	O V1P0S	**Data Out:** High speed serialized data outputs.
USB3DEV_REXT[0]		**Resistor Compensation:** An external resistor must be connected between this pin and package ground. Contact your Intel representative for details.

Table 218. USB ULPI Device Signals

Signal Name	Direction Plat. Power	Description
USB_ULPI_CLK	I V1P8A	**Interface Clock** By default, control and data signals are synchronous to clock.
USB_ULPI_DATA[7:0]	I/O V1P8A	**Bi-directional data bus** Driven low by the Link during idle. The Link starts a transfer by sending a non-zero pattern. The PHY must assert USB_ULPI_DIR before using the data bus. A turnaround cycle is required every time that USB_ULPI_DIR toggles.
USB_ULPI_DIR	I V1P8A	**Direction of the data bus** By default, USB_ULPI_DIR is low and the PHY listens for non-zero data from the Link. The PHY asserts USB_ULPI_DIR to get control of the data bus.
USB_ULPI_NXT	I V1P8A	**Next Data** The PHY drives USB_ULPI_NXT high to throttle the data bus
USB_ULPI_STP	O V1P8A	**Stop data** The Link drives USB_ULPI_STP high to signal the end of its data stream. The Link can also drive USB_ULPI_STP high to request data bus access from the PHY
USB_ULPI_REFCLK	O V1P8A	**Reference clock** ULPI reference clock for external PHY
USB_ULPI_RST#	O V1P8A	**Reset** Used to reset the external PHY. Not part of ULPI specification. Optionally used by driver.

19.1 USB Device Controller

The USB device controller can control one USB 3.0 Device port. Either a combo SS + ULPI Device port, or UPLI only port. It supports hosts conforming to USB 3.0 at bit rates up to 5 Gbps on USB3DEV interface as well as USB 2.0 hosts at up to 480 Mbps via a PHY on ULPI.

19.1.1 Features

Features supported by the Device Controller include:

- Enumerable by both ACPI and PCI. The USB3 device subsystem is designed to appear to the OS as a true PCI device. It will also support ACPI-enumerated methods.
- Device controller registers and data structures are implemented as extensions to the EHCI programmers interface.
- Support for LPM (Link Power Management)

Some of the key features of the ULPI device controller are:

- Supports up to 8 endpoints when acting as device
- 8-bit data interface transmitted at 60 MHz ULPI clock

Note: Recommended not to disconnect the connection when a debug session is in progress.

19.1.2 Power Management Features

The USB 3.0 device subsystem supports the following device power states:

- D0: Functional and highest power state.
- RTD3 (D3): Software managed deepest low power state in which state is saved/ restored if needed prior to entry/exit

19.1.2.1 D0

This is the Functional and highest power state. The USB 3.0 device subsystem is in this state when the USB link is in U0 (U0 is the normal operational state where packets can be transmitted and received).

19.1.2.2 D3

D3 is a low power state that is used when the link is suspended; for example, U3 (U3 is a link state where a device is put into a suspend state. Significant link and device powers are saved).

This is a software directed state in which the controller is either power gated or the power is disabled.

19.1.3 Interrupts

A Functional Interrupt is generated by the logic in the USB device controller core to indicate the occurrence of an event needing application intervention. The design of the USB device core is such that events such as "link change" that would traditionally trigger an interrupt through an interrupt status register, are instead delivered to an 'Event buffer' in host memory, together with an interrupt indicating this.

19.2 References

Universal Serial Bus (USB) 3.0 Revision Specification

Universal Serial Bus (USB) 2.0 Revision Specification

ULPI Working Group: http://www.ulpi.org/

19.3 Register Map

See Chapters Section 3, "Register Access Methods" on page 69 and Section 4, "Mapping Address Spaces" on page 75 for additional information. Also note that the device controller also contains both device and host registers. The host functionality of this controller is not fully functional and should not be used. See the USB Host chapter for host controllers.

19.4.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:22, F:0] + Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: Reserved0 (bits 31:24), MULFNDEV (bit 23), HEADERTYPE (bits 22:16), LATTIMER (bits 15:8), CACHELINE_SIZE (bits 7:0)

Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.

Bit Range	Default & Access	Description
15:8	00h RO	**LATTIMER:** Reserved.
7:0	00h RW	**CACHELINE_SIZE:** Reserved.

19.4.5 reg_BAR_type (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: PCI Configuration Register (Size: 32 bits) **BAR:** [B:0, D:22, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

19.4.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SUBSYSTEMID: [B:0, D:22, F:0] + 2Ch

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

SUBSYSTEMID | SUBSYSTEMVENDORID

Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBSYSTEMID:** Reserved.
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** Reserved.

19.4.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**EXPANSION_ROM_BASEADDR:** [B:0, D:22, F:0] + 30h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EXPANSION_ROM_BASE

Bit Range	Default & Access	Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** Reserved.

19.4.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**CAPABILITYPTR:** [B:0, D:22, F:0] + 34h

Default: 00000080h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

0	0h RO	**Reserved6:** Reserved.

19.5.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h

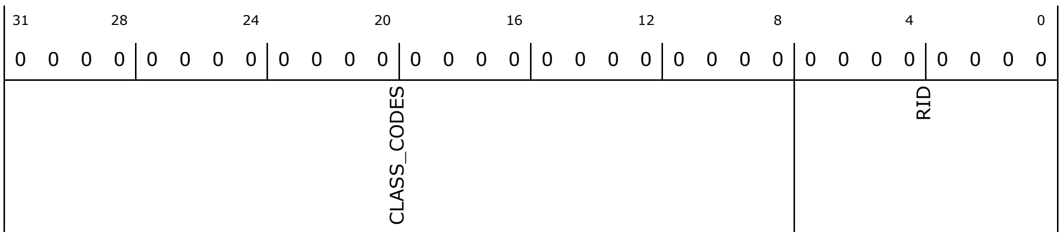
REVCLASSCODE - Revision ID and Class Code

Access Method

Type: PCI Configuration Register (Size: 32 bits)

REVCLASSCODE: [B:0, D:22, F:0] + 8h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	000000h RO	**CLASS_CODES:** Reserved.
7:0	00h RO	**RID:** Reserved.

19.5.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch

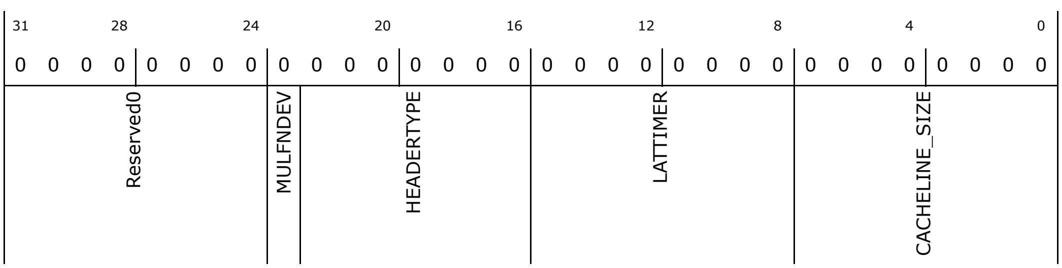
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CLLATHEADERBIST: [B:0, D:22, F:0] + Ch

Default: 00000000h



Bit Range	Default & Access	Description
31:24	00h RO	**Reserved0:** Reserved.
23	0h RO	**MULFNDEV:** Reserved.
22:16	00h RO	**HEADERTYPE:** Reserved.

Bit Range	Default & Access	Description

19.6.1 CAPLENGTH—Offset 0h

This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

CAPLENGTH: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00960020h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	1	0	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

HCIVERSION | RSVD0 | CAPLENGTH

Bit Range	Default & Access	Description
31:16	096h RO	**HCIVERSION:** This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. e.g. 0100h corresponds to xHCI version 1.0.xs
15:8	0h RO	**RSVD0:** Reserved.
7:0	20h RO	**CAPLENGTH:** This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

19.6.2 HCSPARAMS1—Offset 4h

number of ports implemented is 2 because there is 1 DWC_USB2_HOST_NUM_U2_ROOT_PORTS and 1 DWC_USB3_HOST_NUM_U3_ROOT_PORT

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS1: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 0200017Fh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	1	1	1	1	1

MAXPORTS | HCSPARAMS1_RSVD1 | MAXINTRS | MAXSLOTS

Bit Range	Default & Access	Description
31:24	02h RO	**MAXPORTS:** Number of Ports (MaxPorts). This field specifies the maximum Port Number value, i.e. the highest numbered Port Register Set that are addressable in the Operational Register Space (refer to Table 29). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an xHCI Supported Protocol Capability, described in section 7.2. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.
23:19	0h RO	**HCSPARAMS1_RSVD1:** reserved

Bit Range	Default & Access	Description
18:8	1h RO	**MAXINTRS:** Number of Interrupters (MaxIntrs). This field specifies the number of Interrupters implemented on this host controller. Each Interrupter may be allocated to a MSI or MSI-X vector and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to section 5.5). Valid values are in the range of 1h to 400h. A 0 in this field is undefined.
7:0	7fh RO	**MAXSLOTS:** Number of Device Slots (MaxSlots). This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255. The value of 0 is reserved.

19.6.3 HCSPARAMS2—Offset 8h

Host Controller Structural Parameters 2

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

HCSPARAMS2: [BAR] + 8h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 140000F1h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Value	0 0 0 1	0 1 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 1	0 0 0 1

Field	Bits
MAXSCRATCHPADBUFS	31:27
SPR	26
HCSPARAMS2_RSVD1	25:13
IOCINTERVAL	12:8
ERSTMAX	7:4
IST	3:0

Bit Range	Default & Access	Description
31:27	02h RO	**MAXSCRATCHPADBUFS:** For xHCI 0.96,this field is Max Scratchpad Bufs / For xHCI 1.0, this field is Max Scratchpad Bufs Lo
26	1h RO	**SPR:** Scratchpad Restore (SPR)
25:13	0h RO	**HCSPARAMS2_RSVD1:** reserved
12:8	0h RO	**IOCINTERVAL:** This field is valid only for xHCI 0.96. For xHCI 1.0, this field is Reserved.
7:4	fh RO	**ERSTMAX:** Event Ring Segment Table Max (ERST Max)
3:0	1h RO	**IST:** Isochronous Scheduling Threshold (IST)

19.6.4 HCSPARAMS3—Offset Ch

Structural Parameters 3 Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

HCSPARAMS3: [BAR] + Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 07FF000Ah

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0

U2_DEVICE_EXIT_LAT | HCSPARAMS3_RSVD | U1_DEVICE_EXIT_LAT

Bit Range	Default & Access	Description
31:16	07ffh RO	**U2_DEVICE_EXIT_LAT:** Reserved.
15:8	0h RO	**HCSPARAMS3_RSVD:** Reserved.
7:0	0ah RO	**U1_DEVICE_EXIT_LAT:** Reserved.

19.6.5 HCCPARAMS—Offset 10h

Capability Parameters Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

HCCPARAMS: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 0220F04Ch

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	1	0	0	0	1	0	0	0	0	0	1	1	1	1	0	0	0	0	0	1	0	0	1	1	0	0

XECP | MAXPSASIZE | HCCPARAMS_RSVD | SBD | FSE | NSS | LTC | LHRC | PIND | PPC | CSZ | BNC | AC64

Bit Range	Default & Access	Description
31:16	220h RO	**XECP:** Based on configuration, core automatically updates it

Bit Range	Default & Access	Description
15:12	fh RO	**MAXPSASIZE:** Maximum Primary Stream Array Size
11:10	0h RO	**HCCPARAMS_RSVD:** Reserved
9	0h RO	**SBD:** Secondary Bandwidth Domain Reporting (SBD)
8	0h RO	**FSE:** For xHCI 0.96, this field is Force Stopped Event (FSE) / For xHCI 1.0, this field is Parse All Event Data (PAE)
7	0h RO	**NSS:** No Secondary SID Support (NSS). This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. (refer to Sections 4.12.2 and 6.2.3).
6	1h RO	**LTC:** Latency Tolerance Messaging Capability (LTC). This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to section 4.13.1 for more information on LTM.
5	0h RO	**LHRC:** Light HC Reset Capability (LHRC). This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the Light Host Controller Reset (LHCRST) flag in the USBCMD register (refer to Section 5.4.1).
4	0h RO	**PIND:** Port Indicators (PIND). This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. Refer to Section 5.4.8 for definition of the Port Indicator Control field.
3	1h RO	**PPC:** Port Power Control (PPC). This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port do not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register (refer to Section 5.4.8).
2	1h RO	**CSZ:** Context Size (CSZ). If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does not apply to Stream Contexts.
1	0h RO	**BNC:** BW Negotiation Capability (BNC). This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: for Value 0 Description BW Negotiation not implemented. for Value 1 DescriptionBW Negotiation implemented. Refer to section 4.16 of XHCI specification for more information on Bandwidth Negotiation.
0	0h RO	**AC64:** 64-bit Addressing Capability (AC64). This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: for Value 0 Description 32-bit address memory pointers implemented. for Value 1 description 64-bit address memory pointers implemented. If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.

19.6.6 DBOFF—Offset 14h

Doorbell Offset Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DBOFF: [BAR] + 14h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000480h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0	0	0	0

DOORBELL_ARRAY_OFFSET | RSVD4

Bit Range	Default & Access	Description
31:2	120h RO	**DOORBELL_ARRAY_OFFSET:** Based on configuration, core automatically updates it
1:0	0h RO	**RSVD4:** Reserved

19.6.7 RTSOFF—Offset 18h

Runtime Register Space Offset Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RTSOFF: [BAR] + 18h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000440h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0	0	0

RUNTIME_REG_SPACE_OFFSET | RSVD5

Bit Range	Default & Access	Description
31:5	22h RO	**RUNTIME_REG_SPACE_OFFSET:** Based on configuration, core automatically updates it
4:0	0h RO	**RSVD5:** Reserved

19.6.8 Rsvd_HC—Offset 1Ch

reserved

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Rsvd_HC: [BAR] + 1Ch

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h

Bits	31:0
Default	0000 0000 0000 0000 0000 0000 0000 0000
Field	RSVD6

Bit Range	Default & Access	Description
31:0	0h RO	**RSVD6:** Reserved.

19.6.9 USBCMD—Offset 20h

USB Command Register Bit Definitions

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

USBCMD: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h

Bits	31:12	11	10	9	8	7	6:4	3	2	1	0
Default	0000 0000 0000 0000 0000	0	0	0	0	0	000	0	0	0	0
Field	RSVD8	EU3S	EWE	CRS	CSS	LHCRST	RSVD7	HSEE	INTE	HCRST	R_S

Bit Range	Default & Access	Description
31:12	0h RO	**RSVD8:** reserved
11	0h RW	**EU3S:** Enable U3 MFINDEX Stop (EU3S) - RW. Default = 0. When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to section 4.14.2 for more information.
10	0h RW	**EWE:** Enable Wrap Event (EWE) - RW. Default = 0. When set to 1, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to section 4.14.2 for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.

Bit Range	Default & Access	Description
9	0h RW	**CRS:** Controller Restore State: This command is similar to the USBCMD. CRS bit in host mode and initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'.
8	0h RW	**CSS:** Controller Save State: This command is similar to the USBCMD. CSS bit in host mode and initiates the save process. When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'.
7	0h RW	**LHCRST:** Light Host Controller Reset (LHCRST) RO or RW. Optional normative. Default = 0. If the Light HC Reset Capability (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the Light Host Controller Reset has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. Refer to section 4.23.1 for more information. When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. Disable the VFs device slots and set the associated VF Run bit to Stopped. Refer to section 8 for more information.
6:4	0h RO	**RSVD7:** Reserved
3	0h RW	**HSEE:** Host System Error Enable (HSEE) RW. Default = 0. When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to section 4.10.2.6 for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to section 8 for more information.
2	0h RW	**INTE:** Interrupter Enable (INTE) RW. Default = 0. This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, e.g. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSI-X, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF. Refer to section 7.7.2 for more information.
1	0h RW	**HCRST:** Host Controller Reset (HCRST) RW. Default = 0. This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reset shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller as described in Section 4.1 in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to section 8 for more information.

Bit Range	Default & Access	Description
0	0h RW	**R_S:** Run/Stop (R/S) RW. Default = 0. 1 = Run. 0 = Stop. When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may result in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF. Refer to section 8 for more information.

19.6.10 USBSTS—Offset 24h

USB Command Register Bit Definitions

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

USBSTS: [BAR] + 24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
RSVD11																			HCE	CNR	SRE	RSS	SSS	RSVD10			PCD	EINT	HSE	RSVD9	HCH

Bit Range	Default & Access	Description
31:13	0h RO	**RSVD11:** reserved
12	0h RO	**HCE:** Host Controller Error (HCE) - RO. Default = 0. 0' = No internal xHC error conditions exist '1' = Internal xHC error condition. This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and reinitialize the xHC. Refer to section 4.24.1 of xhci specification for more information.
11	0h RO	**CNR:** Controller Not Ready (CNR) - RO. Default = '1'. '0' = Ready '1' = Not Ready. Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = '0'. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared ('0') until the next Chip Hardware Reset.
