BACKLIGHT

Using the LED backlight requires an current source or external current-limiting resistor. Forward voltage for white LED backlight is 3.0~3.6V. Please take care of derating for $T_a > +25^\circ\text{C}$

Attention: Do never drive backlight directly to 5V; this may damage backlight immediately !

The blue display cannot be read without backlight. For direct sunlight we suggest to use the J-type.

SERIAL MODE SPI

Factory set for interface is parallel with 4 bit or 8 bit data bus. Alternative module can be programmed with serial data stream. For that solder link **SPI** has to be closed. Hardware specification for serial operation mode is written down in user manual for SSD1803: http://www.lcd-module.de/fileadmin/user_upload/pdf/zubehoer/SSD1803_0.20.pdf. Software for initialisation and programming keeps the same.

Please make shure that software will check busy-flag before writing any command !

CHARACTER SET

Beside there's a copy of built.in character set. In addition to that up to 8 individual character can be created.

CONTRAST ADJUSTMENT

Contrast will be set by pin 3 (VCI). Module EA DIP203 comes with built-in temperature compensation for -20..+70°C as a standard; any contrast adjustment while operation is no longer required.

CREATING YOUR OWN CHARACTERS

All these character display modules got the feature to create 8 own characters (ASCII Codes 0..7) in addition to the 240 ROM fixed codes.

- 1.) The command "CG RAM Address Set" defines the ASCII code (Bit 3,4,5) and the dot line (Bit 0,1,2) of the new character. Example demonstrates creating ASCII code \$00.
- 2.) Doing 8 times the write command "Data Write" defines line by line the new character. 8th. byte stands for the cursor line.
- 3.) The new defined character can be used as a "normal" ASCII code (0..7); use with "DD RAM Address Set" and "Data Write".

Set CG RAM Address				Data									
Adresse		Hex	Bit		Hex								
7	6	5	4			3	2	1	0				
0	1	0	0	X	X	X	X	0	0	1	0	0	\$04
								0	0	1	0	0	\$04
								0	1	0	0	\$04	
								0	1	1	0	\$04	
								1	0	0	0	\$15	
								1	0	1	0	\$0E	
								1	1	0	0	\$04	
								1	1	1	0	\$00	

DRIVING WITH 5V-SYSTEMS

The supply voltage of the display is necessarily 3.3V. If a 5V-system is used, the level have to be adapted. For example you can use a bidirectional levelshifter (e.g. PS 74LVC4245A), like shown in the opposite figure.

COMPATIBILITY WITH EA DIP204-6

The displays of EA DIP203 and EA DIP204 series are electrically and mechanically identical to each other running with 3.3V supply mode. Merely a 5V supply is not acceptable with the new EA DIP203 series.

DIMENSIONS

all dimensions are in mm

Note:
LC-Displays are generally not suited to wave or reflow soldering. Temperatures of over 90°C can cause lasting damage.

DRIVING THE SYMBOLS

After power-on symbols will be set accidental. To switch off them all please refer to the example of initializing on page 3. To display an individual symbol have a look at the program example at the right.

Each symbol can be displayed in normal (solid) and blinking style.
