CYRS1545AV18

72-Mbit QDR® II+ SRAM Four-Word Burst Architecture with RadStop™ Technology

Radiation Performance

Radiation Data

- Total Dose = 300 Krad
- Soft error rate (both Heavy Ion and proton) Heavy ions $\leq 1 \times 10^{-10}$ upsets/bit-day with an external SECDED EDAC Controller
- Neutrons = 2.0×10^{14} N/cm^2
- Dose rate = 2.0×10^{9} rad(Si)/sec
- Dose rate survivability (rad(Si)/sec) = 1.5 × 10^11 (rad(Si)/sec
- Latch up immunity = 120 MeV.cm^2/mg (125 °C)

Prototyping Options

- Non-qualified CYPT1543AV18, and CYPT1545AV18 devices with same functional and timing characteristics in a 165-ball Ceramic Column Grid Array (CCGA) package and Land Grid Array (LGA) package without solder columns attached.

Features

- Separate independent read and write data ports
  - Supports concurrent transactions
- 250 MHz clock for high bandwidth
- Four-word burst for reducing address bus frequency
- Double data rate (DDR) interfaces on both read and write ports at 250 MHz (data transferred at 500 MHz)
- Two input clocks (K and $\overline{K}$) for precise DDR timing
  - SRAM uses rising edges only
- Echo clocks (CQ and $\overline{CQ}$) simplify data capture in high speed systems
- Single multiplexed address input bus latches address inputs for read and write ports
- Separate port selects for depth expansion
- Synchronous internally self-timed writes
- QDR® II+ operates with 2.0 cycle read latency when the delay lock loop (DLL) is enabled
- Available in × 18, and × 36 configurations
- Full data coherency, providing most current data
- Core V_{DD} = 1.8 (± 0.1 V); I/O V_{DDQ} = 1.4 V to V_{DD}
- Available in 165-ball CCGA (21 × 25 × 2.83 mm)
- HSTL inputs and variable drive HSTL output buffers
- JTAG 1149.1 compatible test access port
- DLL for accurate data placement

Configurations

CYRS1543AV18 – 4M × 18

CYRS1545AV18 – 2M × 36

Functional Description

The CYRS1543AV18 and CYRS1545AV18 are synchronous pipelined SRAMs, equipped with 1.8 V QDR II+ architecture with RadStop™ technology. Cypress's state-of-the-art RadStop Technology is radiation hardened through proprietary design and process hardening techniques.

The QDR II+ architecture consists of two separate ports: the read port and the write port to access the memory array. The read port has dedicated data outputs to support read operations and the write port has dedicated data inputs to support write operations. QDR II+ architecture has separate data inputs and data outputs to completely eliminate the need to turnaround the data bus that exists with common I/O devices. Each port can be accessed through a common address bus. Addresses for read and write addresses are latched on alternate rising edges of the input (K) clock. Accesses to the QDR II+ read and write ports are completely independent of one another. To maximize data throughput, both read and write ports are equipped with DDR interfaces. Each address location is associated with four 18-bit words (CYRS1543AV18) or 36-bit words (CYRS1545AV18) that burst sequentially into or out of the device. Because data can be transferred into and out of the device on every rising edge of both input clocks (K and $\overline{K}$), memory bandwidth is maximized while simplifying system design by eliminating bus turnarounds.

Depth expansion is accomplished with port selects, which enables each port to operate independently.

All synchronous inputs pass through input registers controlled by the K or $\overline{K}$ input clocks. All data outputs pass through output registers controlled by the K or $\overline{K}$ input clocks. Writes are conducted with on-chip synchronous self-timed write circuitry.

Radiation Hardened Design

The single event latch up (SEL) immunity is improved by a radiation hardened design technique developed by Cypress called RadStop. This design mitigation technique allows the SEL performance to achieve radiation hard performance levels.

Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max*	Unit
LSBU	Logical single-bit upsets	25 °C	320	368	FIT/ Mb

Pin Definitions

Pin Name	I/O	Pin Description
$D_{[x:0]}$	Input-Synchronous	**Data input signals**. Sampled on the rising edge of K and $\overline{K}$ clocks when valid write operations are active. CYRS1543AV18 – $D_{[17:0]}$ CYRS1545AV18 – $D_{[35:0]}$
$\overline{WPS}$	Input-Synchronous	**Write port select** – **Active LOW**. Sampled on the rising edge of the K clock. When asserted active, a write operation is initiated. Deasserting deselects the write port. Deselecting the write port ignores $D_{[x:0]}$.
$\overline{BWS_0}$, $\overline{BWS_1}$, $\overline{BWS_2}$, $\overline{BWS_3}$	Input-Synchronous	**Byte write select (BWS) 0, 1, 2, and 3** – **Active LOW**. Sampled on the rising edge of the K and $\overline{K}$ clocks when write operations are active. Used to select which byte is written into the device during the current portion of the write operations. Bytes not written remain unaltered. CYRS1543AV18 – $\overline{BWS_0}$ controls $D_{[8:0]}$ and $\overline{BWS_1}$ controls $D_{[17:9]}$. CYRS1545AV18 – $\overline{BWS_0}$ controls $D_{[8:0]}$, $\overline{BWS_1}$ controls $D_{[17:9]}$, $\overline{BWS_2}$ controls $D_{[26:18]}$ and $\overline{BWS_3}$ controls $D_{[35:27]}$. All the BWS are sampled on the same edge as the data. Deselecting a BWS ignores the corresponding byte of data and it is not written into the device.
$A_{[x:0]}$	Input-Synchronous	**Address inputs**. Sampled on the rising edge of the K clock during active read and write operations. These address inputs are multiplexed for both read and write operations. Internally, the device is organized as 4M × 18 (4 arrays each of 1M × 18) for CYRS1543AV18 and 2M × 36 (4 arrays each of 512K × 36) for CYRS1545AV18. Therefore, only 20 address inputs for CYRS1543AV18 and 19 address inputs for CYRS1545AV18. These inputs are ignored when the appropriate port is deselected.
$Q_{[x:0]}$	Outputs-Synchronous	**Data output signals**. These pins drive out the requested data when the read operation is active. Valid data is driven out on the rising edge of the K and K clocks during read operations. On deselecting the read port, $Q_{[x:0]}$ are automatically tristated. CYRS1543AV18 – $Q_{[17:0]}$ CYRS1545AV18 – $Q_{[35:0]}$
$\overline{RPS}$	Input-Synchronous	**Read port select** – **Active LOW**. Sampled on the rising edge of positive input clock (K). When active, a read operation is initiated. Deasserting deselects the read port. When deselected, the pending access is allowed to complete and the output drivers are automatically tristated following the next rising edge of the K clock. Each read access consists of a burst of four sequential transfers.
QVLD	Valid Output Indicator	**Valid output indicator**. The Q Valid indicates valid output data. QVLD is edge aligned with CQ and $\overline{CQ}$.
K	Input Clock	**Positive input clock input**. The rising edge of K is used to capture synchronous inputs to the device and to drive out data through $Q_{[x:0]}$ when in single clock mode. All accesses are initiated on the rising edge of K.
$\overline{K}$	Input Clock	**Negative input clock input**. $\overline{K}$ is used to capture synchronous inputs being presented to the device and to drive out data through $Q_{[x:0]}$ when in single clock mode.
CQ	Echo Clock	**Synchronous echo clock outputs**. This is a free running clock and is synchronized to the input clock K. The timings for the echo clocks are shown in the Switching Characteristics on page 25.
$\overline{CQ}$	Echo Clock	**Synchronous echo clock outputs**. This is a free running clock and is synchronized to the input clock K. The timings for the echo clocks are shown in the Switching Characteristics on page 25.
ZQ	Input	**Output impedance matching input**. This input is used to tune the device outputs to the system data bus impedance. CQ, $\overline{CQ}$, and $Q_{[x:0]}$ output impedance are set to 0.2 × RQ, where RQ is a resistor connected between ZQ and ground. Alternatively, this pin can be connected directly to V_{DDQ}, which enables the minimum impedance mode. This pin cannot be connected directly to GND or left unconnected.
$\overline{DOFF}$	Input	**DLL turn off** – **Active LOW**. Connecting this pin to ground turns off the DLL inside the device. The timings in the DLL turned off operation differs from those listed in this data sheet. For normal operation, this pin can be connected to a pull up through a 10 KΩ or less pull up resistor. The device behaves in QDR I mode when the DLL is turned off. In this mode, the device can be operated at a frequency of up to 167 MHz with QDR I timing.
TDO	Output	**Test data out (TDO) Pin for JTAG**.
TCK	Input	**Test clock (TCK) Pin for JTAG**.

Pin Definitions (continued)

Pin Name	I/O	Pin Description
TDI	Input	**Test data in (TDI) Pin for JTAG**.
TMS	Input	**Test mode select (TMS) Pin for JTAG**.
NC	N/A	**Not connected to the die**. Can be tied to any voltage level.
NC/144M	N/A	**Not connected to the die**. Can be tied to any voltage level.
NC/288M	N/A	**Not connected to the die**. Can be tied to any voltage level.
V_{REF}	Input-Reference	**Reference voltage input**. Static input used to set the reference level for HSTL inputs, outputs, and AC measurement points.
V_{DD}	Power Supply	**Power supply inputs to the core of the device**.
V_{SS}	Ground	**Ground for the device**.
V_{DDQ}	Power Supply	**Power supply inputs for the outputs of the device**.

Functional Overview

The CYRS1543AV18, CYRS1545AV18 are synchronous pipelined burst SRAMs with a read port and a write port. The read port is dedicated to read operations and the write port is dedicated to write operations. Data flows into the SRAM through the write port and flows out through the read port. These devices multiplex the address inputs to minimize the number of address pins required. By having separate read and write ports, the QDR II completely eliminates the need to turnaround the data bus and avoids any possible data contention, thereby simplifying system design. Each access consists of four 18-bit data transfers in the case of CYRS1543AV18, and four 36-bit data transfers in the case of CYRS1545AV18 in two clock cycles.

This device operates with a read latency of two cycles when $\overline{DOFF}$ pin is tied HIGH. When $\overline{DOFF}$ pin is set LOW or connected to V_{SS} then device behaves in QDR I mode with a read latency of one clock cycle. $\overline{DOFF}$ is not a recommended mode of operation.

Accesses for both ports are initiated on the positive input clock (K). All synchronous input timing is referenced from the rising edge of the input clocks (K and $\overline{K}$) and all output timing is referenced to the output clocks (K and $\overline{K}$).

All synchronous data inputs ($D_{[x:0]}$) pass through input registers controlled by the input clocks (K and $\overline{K}$). All synchronous data outputs ($Q_{[x:0]}$) pass through output registers controlled by the rising edge of the output clocks (K and $\overline{K}$).

All synchronous control ($\overline{RPS}$, $\overline{WPS}$, $\overline{BWS}_{[x:0]}$) inputs pass through input registers controlled by the rising edge of the input clocks (K and $\overline{K}$).

CYRS1543AV18 is described below. The same basic descriptions also apply to CYRS1545AV18.

Read Operations

The CYRS1543AV18 is organized internally as four arrays of 1M × 18. Accesses are completed in a burst of four sequential 18-bit data words. Read operations are initiated by asserting $\overline{RPS}$ active at the rising edge of the positive input clock (K). The address presented to the address inputs is stored in the read address register. Following the next two K clock rising edges, the corresponding lower order 18-bit word of data is driven onto the $Q_{[17:0]}$ using K as the output timing reference. On the subsequent rising edge of $\overline{K}$, the next 18-bit data word is drive onto the $QQ_{[17:0]}$. This process continues until all four 18-bit data words have been driven out onto $Q_{[17:0]}$. The requested data is valid 0.45 ns from the rising edge of the output clock (K or $\overline{K}$). To maintain the internal logic, each read access must be allowed to complete. Each read access consists of four 18-bit data words and takes two clock cycles to complete. Therefore, read accesses to the device can not be initiated on two consecutive K clock rises. The internal logic of the device ignores the second read request. Read accesses can be initiated on every other K clock rise. Doing so pipelines the data flow such that data is transferred out of the device on every rising edge of the output clocks (K or $\overline{K}$).

When the read port is deselected, the CYRS1543AV18 first completes the pending read transactions. Synchronous internal circuitry automatically tri-states the outputs following the next rising edge of the positive input clock (K).

Write Operations

Write operations are initiated by asserting $\overline{WPS}$ active at the rising edge of the positive input clock (K). On the following K clock rise the data presented to $D_{[17:0]}$ is latched and stored into the lower 18-bit write data register, provided $\overline{BWS}_{[1:0]}$ are both asserted active. On the subsequent rising edge of the negative input clock ($\overline{K}$) the information presented to $D_{[17:0]}$ is stored into the higher 18-bit write data register, provided $\overline{BWS}_{[1:0]}$ are both asserted active. This process continues for one more cycle until four 18-bit words (a total of 72 bits) of data are stored in the SRAM. The 72 bits of data are then written into the memory array at the specified location. Therefore, write accesses to the device can not be initiated on two consecutive K clock rises. The internal logic of the device ignores the second write request. Write accesses can be initiated on every other rising edge of the positive input clock (K). Doing so pipelines the data flow such that 18 bits of data can be transferred into the device on every rising edge of the input clocks (K and $\overline{K}$).

When deselected, the write port ignores all inputs after the pending write operations have been completed.

Byte Write Operations

Byte write operations are supported by the CYRS1543AV18. A write operation is initiated as described in the Write Operations section. The bytes that are written are determined by $\overline{BWS}_0$ and $\overline{BWS}_1$, which are sampled with each set of 18-bit data words. Asserting the appropriate BWS input during the data portion of a write latches the data being presented and writes it into the device. Deasserting the BWS input during the data portion of a write allows the data stored in the device for that byte to remain unaltered. This feature can be used to simplify read, modify, or write operations to a byte write operation.

Concurrent Transactions

The read and write ports on the CYRS1543AV18 operate independently of one another. As each port latches the address inputs on different clock edges, you can read or write to any location, regardless of the transaction on the other port. If the ports access the same location when a read follows a write in successive clock cycles, the SRAM delivers the most recent information associated with the specified address location. This includes forwarding data from a write cycle that was initiated on the previous K clock rise.

Read access and write access must be scheduled such that one transaction is initiated on any clock cycle. If both ports are selected on the same K clock rise, the arbitration depends on the previous state of the SRAM. If both ports are deselected, the read port takes priority. If a read was initiated on the previous cycle, the write port takes priority (as read operations can not be initiated on consecutive cycles). If a write was initiated on the previous cycle, the read port takes priority (as write operations can not be initiated on consecutive cycles). Therefore, asserting both port selects active from a deselected state results in alternating read or write operations being initiated, with the first access being a read.

Depth Expansion

The CYRS1543AV18 has a port select input for each port. This allows for easy depth expansion. Both port selects are sampled on the rising edge of the positive input clock only (K). Each port select input can deselect the specified port. Deselecting a port does not affect the other port. All pending transactions (read and write) are completed before the device is deselected.

Programmable Impedance

An external resistor, RQ, must be connected between the ZQ pin on the SRAM and V_{SS} to allow the SRAM to adjust its output driver impedance. The value of RQ must be 5 × the value of the intended line impedance driven by the SRAM, the allowable range of RQ to guarantee impedance matching with a tolerance of ±15% is between 175 Ω and 350 Ω, with V_{DDQ} = 1.5 V. The output impedance is adjusted every 1024 cycles upon power up to account for drifts in supply voltage and temperature.

Echo Clocks

Echo clocks are provided on the QDR II+ to simplify data capture on high-speed systems. Two echo clocks are generated by the QDR II+. CQ is referenced with respect to K and $\overline{CQ}$ is referenced with respect to $\overline{K}$. These are free-running clocks and are synchronized to the input clock of the QDR II+. The timing for the echo clocks is shown in the Switching Characteristics on page 25.

Valid Data Indicator (QVLD)

QVLD is provided on the QDR II+ to simplify data capture on high speed systems. The QVLD is generated by the QDR II+ device along with data output. This signal is also edge-aligned with the echo clock and follows the timing of any data pin. This signal is asserted half a cycle before valid data arrives.

DLL

These chips use a DLL that is designed to function between 120 MHz and the specified maximum clock frequency. During power up, when the DOFF is tied HIGH, the DLL is locked after 10240 cycles of stable clock. The DLL can also be reset by slowing or stopping the input clocks K and $\overline{K}$ for a minimum of 30 ns. The DLL may be disabled by applying ground to the DOFF pin. When the DLL is turned off, the device behaves in QDR I mode (with one cycle latency and a longer access time). For information refer to the application note AN5062, DLL Considerations in QDRII/DDRII.

Qualification and Screening

The 90 nm RadStop technology was qualified by Cypress after meeting the criteria of the General Manufacturing Standards. The test flow includes screening units with the defined flow (Class Q, Class V) and the appropriate periodic or lot conformance testing (Groups B, C, D, and E). Both the 90 nm process and the SRAM products are subject to period or lot based technology conformance inspection (TCI) and quality conformance inspection (QCI) tests, respectively. Cypress offers both prototyping models and flight units of these product configurations.

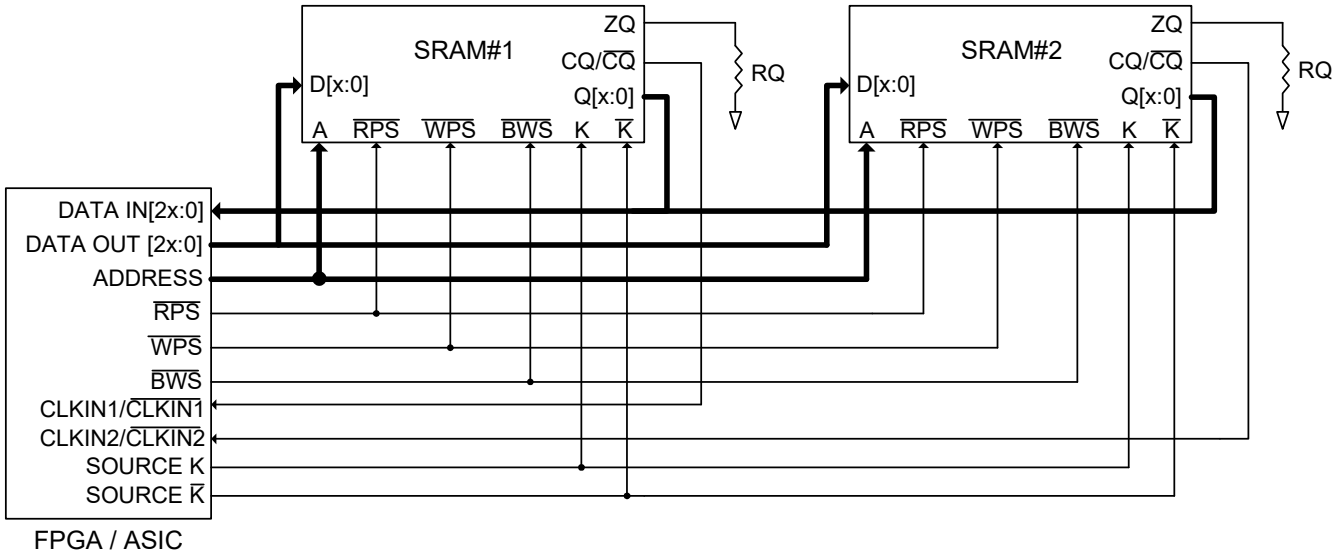
Table 1. Qualification Tests

Groups	Tests
Group A	General electrical tests
Group B	Mechanical - Dimensions, bond strength, solvents, die shear, solderability, lead Integrity, seal, and acceleration
Group C	Life tests - 1000 hours at 125 °C or equivalent
Group D	Package related mechanical tests - shock, vibration, accel, salt, seal, lead finish adhesion, lid torque, thermal shock, and moisture resistance
Group E	Radiation tests

Application Example

Figure 2 shows two QDR II+ used in an application.

Figure 2. Application Example



Truth Table

CYRS1543AV18 and CYRS1545AV18 [2, 3, 4, 5, 6, 7]

Operation	K	$\overline{RPS}$	$\overline{WPS}$	DQ	DQ	DQ	DQ
Write cycle: Load address on the rising edge of K; input write data on two consecutive K and $\overline{K}$ rising edges.	L–H	H [8]	L [9]	D(A) at K(t + 1)↑	D(A + 1) at $\overline{K}$(t + 1)↑	D(A + 2) at K(t + 2)↑	D(A + 3) at $\overline{K}$(t + 2)↑
Read cycle: (2.0 Cycle Latency) Load address on the rising edge of K; wait two cycles; read data on two consecutive K and $\overline{K}$ rising edges.	L–H	L [9]	X	Q(A) at K(t + 2)↑	Q(A + 1) at $\overline{K}$(t + 2)↑	Q(A + 2) at K(t + 3)↑	Q(A + 3) at $\overline{K}$(t + 3)↑

Write Cycle Descriptions

CYRS1543AV18 [2, 10]

$\overline{BWS_0}$	$\overline{BWS_1}$	K	$\overline{K}$	Comments
L	L	L–H	–	During the data portion of a write sequence: CYRS1543AV18 – both bytes ($D_{[17:0]}$) are written into the device.
L	L	–	L–H	During the data portion of a write sequence: CYRS1543AV18 – both bytes ($D_{[17:0]}$) are written into the device.
L	H	L–H	–	During the data portion of a write sequence: CYRS1543AV18 – only the lower byte ($D_{[8:0]}$) is written into the device, $D_{[17:9]}$ remains unaltered.
L	H	–	L–H	During the data portion of a write sequence: CYRS1543AV18 – only the lower byte ($D_{[8:0]}$) is written into the device, $D_{[17:9]}$ remains unaltered.
H	L	L–H	–	During the data portion of a write sequence: CYRS1543AV18 – only the upper byte ($D_{[17:9]}$) is written into the device, $D_{[8:0]}$ remains unaltered.
H	L	–	L–H	During the data portion of a write sequence: CYRS1543AV18 – only the upper byte ($D_{[17:9]}$) is written into the device, $D_{[8:0]}$ remains unaltered.
H	H	L–H	–	No data is written into the devices during this portion of a write operation.
H	H	–	L–H	No data is written into the devices during this portion of a write operation.

Notes
2. X = “Don't Care,” H = Logic HIGH, L = Logic LOW, ↑represents rising edge.
3. Device powers up deselected with the outputs in a tristate condition.
4. “A” represents address location latched by the devices when transaction was initiated. A + 1, A + 2, and A +3 represents the address sequence in the burst.
5. “t” represents the cycle at which a read/write operation is started. t + 1, t + 2, and t + 3 are the first, second and third clock cycles respectively succeeding the “t” clock cycle.
6. Data inputs are registered at K and $\overline{K}$ rising edges. Data outputs are delivered on K and $\overline{K}$ rising edges.
7. We recommend that K = $\overline{K}$ = HIGH when clock is stopped. This is not essential, but permits most rapid restart by overcoming transmission line charging symmetrically.
8. If this signal was LOW to initiate the previous cycle, this signal becomes a “Don’t Care” for this operation.
9. This signal was HIGH on previous K clock rise. Initiating consecutive read or write operations on consecutive K clock rises is not permitted. The device ignores the second read or write request.
10. Is based on a write cycle that was initiated in accordance with the Write Cycle Descriptions table. $\overline{BWS_0}$, $\overline{BWS_1}$, $\overline{BWS_2}$, and $\overline{BWS_3}$ can be altered on different portions of a write cycle, as long as the setup and hold requirements are achieved.

Write Cycle Descriptions

The write cycle description table for CYRS1545AV18 follows. [11, 12]

$\overline{BWS_0}$	$\overline{BWS_1}$	$\overline{BWS_2}$	$\overline{BWS_3}$	K	$\overline{K}$	Comments
L	L	L	L	L–H	–	During the data portion of a write sequence, all four bytes ($D_{[35:0]}$) are written into the device.
L	L	L	L	–	L–H	During the data portion of a write sequence, all four bytes ($D_{[35:0]}$) are written into the device.
L	H	H	H	L–H	–	During the data portion of a write sequence, only the lower byte ($D_{[8:0]}$) is written into the device. $D_{[35:9]}$ remains unaltered.
L	H	H	H	–	L–H	During the data portion of a write sequence, only the lower byte ($D_{[8:0]}$) is written into the device. $D_{[35:9]}$ remains unaltered.
H	L	H	H	L–H	–	During the data portion of a write sequence, only the byte ($D_{[17:9]}$) is written into the device. $D_{[8:0]}$ and $D_{[35:18]}$ remains unaltered.
H	L	H	H	–	L–H	During the data portion of a write sequence, only the byte ($D_{[17:9]}$) is written into the device. $D_{[8:0]}$ and $D_{[35:18]}$ remains unaltered.
H	H	L	H	L–H	–	During the data portion of a write sequence, only the byte ($D_{[26:18]}$) is written into the device. $D_{[17:0]}$ and $D_{[35:27]}$ remains unaltered.
H	H	L	H	–	L–H	During the data portion of a write sequence, only the byte ($D_{[26:18]}$) is written into the device. $D_{[17:0]}$ and $D_{[35:27]}$ remains unaltered.
H	H	H	L	L–H	–	During the data portion of a write sequence, only the byte ($D_{[35:27]}$) is written into the device. $D_{[26:0]}$ remains unaltered.
H	H	H	L	–	L–H	During the data portion of a write sequence, only the byte ($D_{[35:27]}$) is written into the device. $D_{[26:0]}$ remains unaltered.
H	H	H	H	L–H	–	No data is written into the device during this portion of a write operation.
H	H	H	H	–	L–H	No data is written into the device during this portion of a write operation.

Notes
11. X = "Don't Care," H = Logic HIGH, L = Logic LOW, ↑represents rising edge.
12. Is based on a write cycle that was initiated in accordance with the Write Cycle Descriptions table. $\overline{NWS_0}$, $\overline{NWS_1}$, $\overline{BWS_0}$, $\overline{BWS_1}$, $\overline{BWS_2}$, and $\overline{BWS_3}$ can be altered on different portions of a write cycle, as long as the setup and hold requirements are achieved.

IEEE 1149.1 Serial Boundary Scan (JTAG)

These SRAMs incorporate a serial boundary scan Test Access Port (TAP) in the FBGA package. This part is fully compliant with IEEE Standard #1149.1-2001. The TAP operates using JEDEC standard 1.8 V I/O logic levels.

Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW (V_{SS}) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternatively be connected to V_{DD} through a pull up resistor. TDO must be left unconnected. Upon power up, the device comes up in a reset state, which does not interfere with the operation of the device.

Test Access Port

Test Clock

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. This pin may be left unconnected if the TAP is not used. The pin is pulled up internally, resulting in a logic HIGH level.

Test Data In (TDI)

The TDI pin is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see the TAP Controller State Diagram on page 15. TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) on any register.

Test Data Out (TDO)

The TDO output pin is used to serially clock data out from the registers. The output is active, depending upon the current state of the TAP state machine (see Instruction Codes on page 19). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

Performing a TAP Reset

A reset is performed by forcing TMS HIGH (V_{DD}) for five rising edges of TCK. This reset does not affect the operation of the SRAM and can be performed while the SRAM is operating. At power up, the TAP is reset internally to ensure that TDO comes up in a high Z state.

TAP Registers

Registers are connected between the TDI and TDO pins to scan the data in and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction registers. Data is serially loaded into the TDI pin on the rising edge of TCK. Data is output on the TDO pin on the falling edge of TCK.

Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO pins, as shown in TAP Controller Block Diagram on page 16. Upon power up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state, as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary “01” pattern to allow for fault isolation of the board level serial test path.

Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between TDI and TDO pins. This enables shifting of data through the SRAM with minimal delay. The bypass register is set LOW (V_{SS}) when the BYPASS instruction is executed.

Boundary Scan Register

The boundary scan register is connected to all of the input and output pins on the SRAM. Several no connect (NC) pins are also included in the scan register to reserve pins for higher density devices.

The boundary scan register is loaded with the contents of the RAM input and output ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO pins when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD, and SAMPLE Z instructions can be used to capture the contents of the input and output ring.

The Boundary Scan Order on page 20 shows the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI, and the LSB is connected to TDO.

Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in Identification Register Definitions on page 19.

TAP Instruction Set

Eight different instructions are possible with the three-bit instruction register. All combinations are listed in Instruction Codes on page 19. Three of these instructions are listed as RESERVED and must not be used. The other five instructions are described in this section in detail.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO pins. To execute the instruction after it is shifted in, the TAP controller must be moved into the Update-IR state.

IDCODE

The IDCODE instruction loads a vendor-specific, 32-bit code into the instruction register. It also places the instruction register between the TDI and TDO pins and shifts the IDCODE out of the device when the TAP controller enters the Shift-DR state. The IDCODE instruction is loaded into the instruction register at power up or whenever the TAP controller is supplied a Test-Logic-Reset state.

SAMPLE Z

The SAMPLE Z instruction connects the boundary scan register between the TDI and TDO pins when the TAP controller is in a Shift-DR state. The SAMPLE Z command puts the output bus into a high Z state until the next command is supplied during the Update IR state.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is an 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the input and output pins is captured in the boundary scan register.

You must be aware that the TAP controller clock only operates at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output undergoes a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times (t_{CS} and t_{CH}). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the K and $\overline{K}$ captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD places an initial data pattern at the latched parallel outputs of the boundary scan register cells before the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required, that is, while the data captured is shifted out, the preloaded data can be shifted in.

BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO pins. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

EXTEST

The EXTEST instruction drives the preloaded data out through the system output pins. This instruction also connects the boundary scan register for serial access between the TDI and TDO in the Shift-DR controller state.

EXTEST OUTPUT BUS TRISTATE

IEEE Standard 1149.1 mandates that the TAP controller be able to put the output bus into a tristate mode.

The boundary scan register has a special bit located at bit #108. When this scan cell, called the "extest output bus tristate," is latched into the preload register during the Update-DR state in the TAP controller, it directly controls the state of the output (Q-bus) pins, when the EXTEST is entered as the current instruction. When HIGH, it enables the output buffers to drive the output bus. When LOW, this bit places the output bus into a high Z condition.

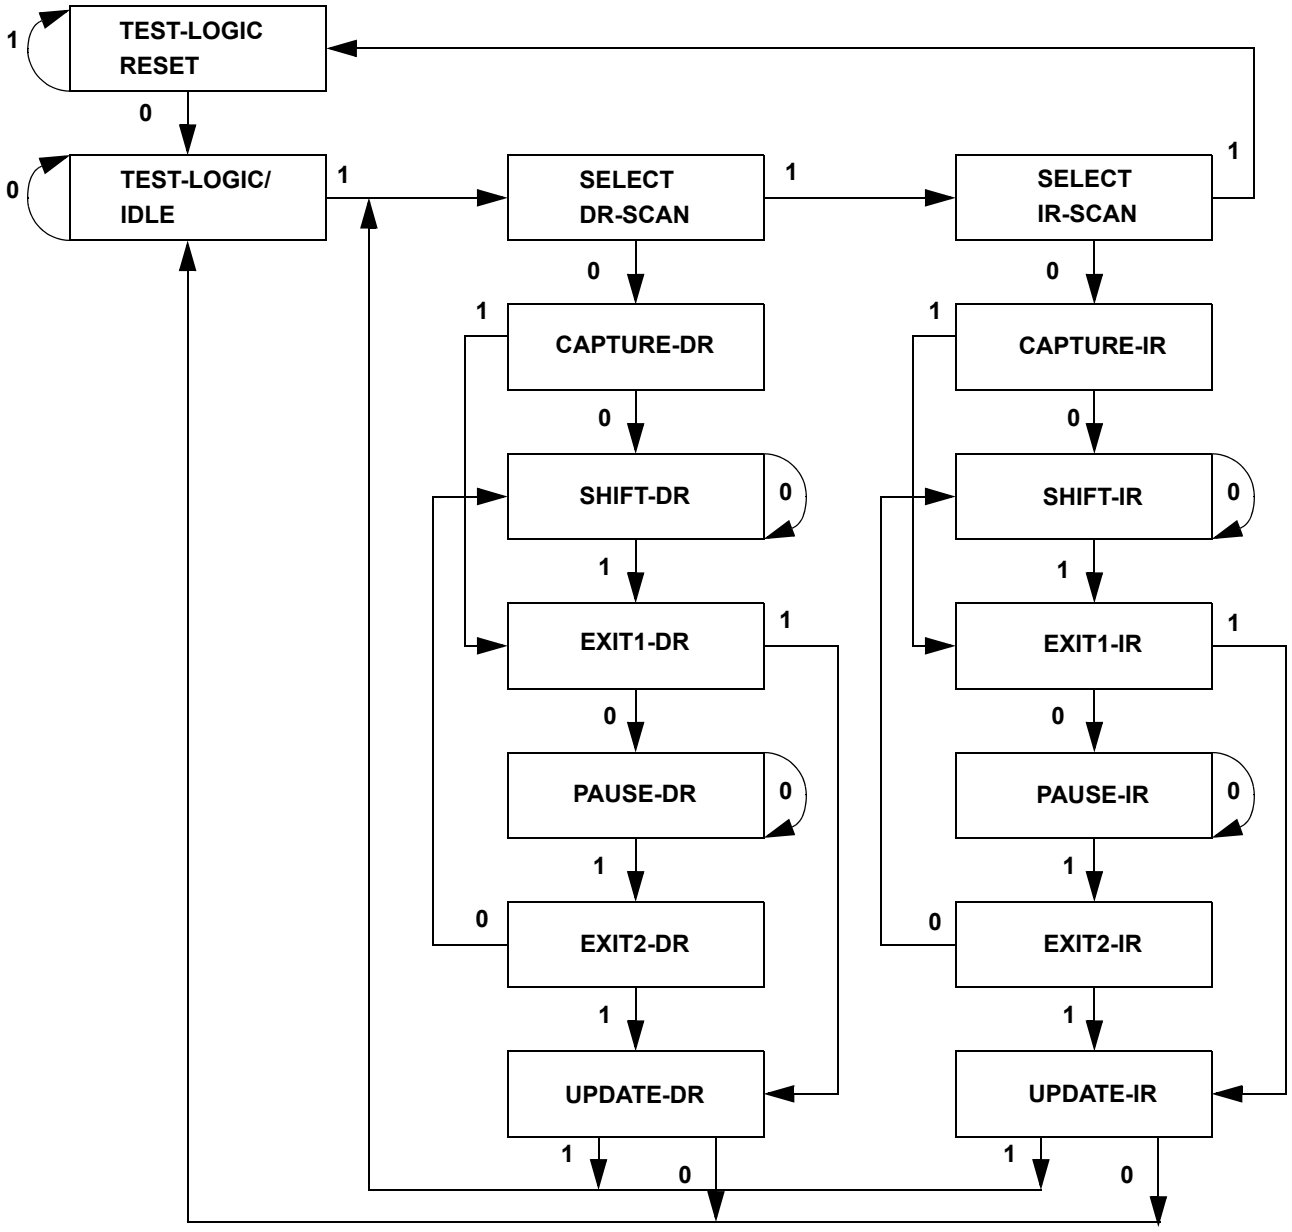
This bit can be set by entering the SAMPLE/PRELOAD or EXTEST command, and then shifting the desired bit into that cell, during the Shift-DR state. During Update-DR, the value loaded into that shift-register cell latches into the preload register. When the EXTEST instruction is entered, this bit directly controls the output Q-bus pins. Note that this bit is preset HIGH to enable the output when the device is powered up, and also when the TAP controller is in the Test-Logic-Reset state.

Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

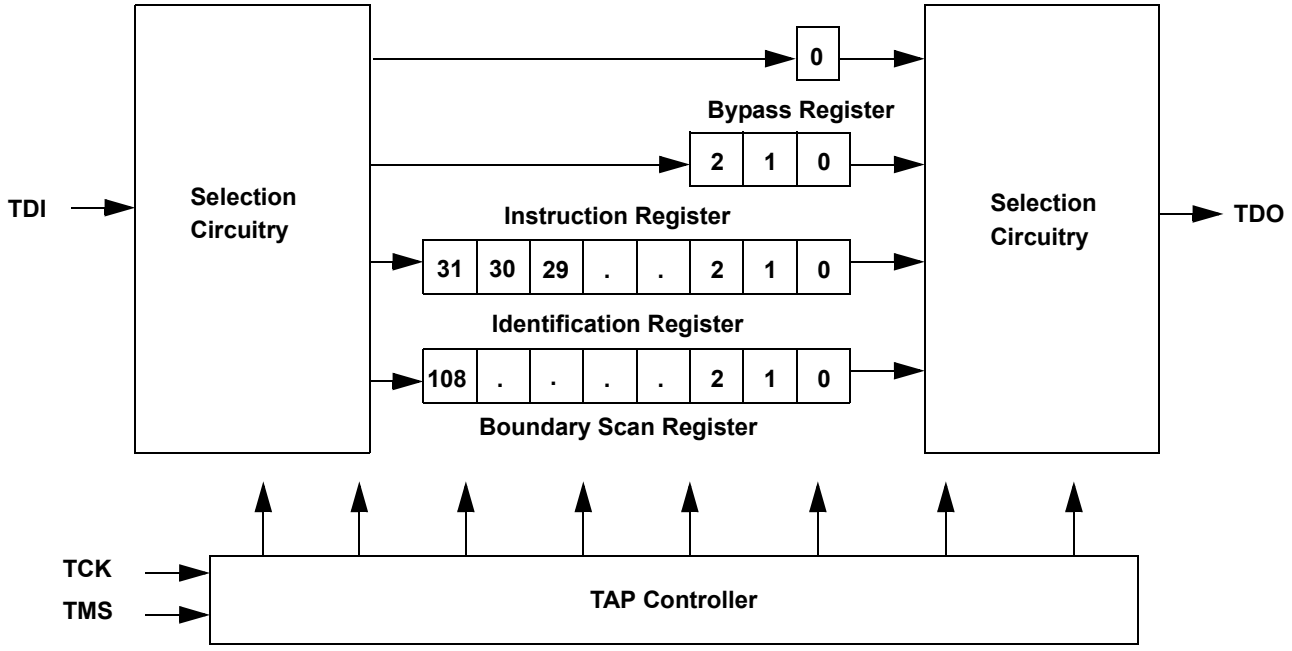
TAP Controller State Diagram

The state diagram for the TAP controller follows. [13]



Note
13. The 0/1 next to each state represents the value at TMS at the rising edge of TCK.

TAP Controller Block Diagram



TAP Electrical Characteristics

Over the Operating Range

Parameter [14, 15, 16]	Description	Test Conditions	Min	Max	Unit
V_{OH1}	Output HIGH voltage	I_{OH} = –2.0 mA	1.4	–	V
V_{OH2}	Output HIGH voltage	I_{OH} = –100 µA	1.6	–	V
V_{OL1}	Output LOW voltage	I_{OL} = 2.0 mA	–	0.4	V
V_{OL2}	Output LOW voltage	I_{OL} = 100 µA	–	0.2	V
V_{IH}	Input HIGH voltage		0.65 × V_{DD}	V_{DD} + 0.3	V
V_{IL}	Input LOW voltage		–0.3	0.35 × V_{DD}	V
I_X	Input and output load current	GND ≤ V_I ≤ V_{DD}	–5	5	µA

Notes
14. These characteristics pertain to the TAP inputs (TMS, TCK, TDI and TDO). Parallel load levels are specified in Electrical Characteristics on page 22.
15. Overshoot: $V_{IH(AC)}$ < V_{DDQ} + 0.85 V (Pulse width less than $t_{CYC}/2$), Undershoot: $V_{IL(AC)}$ > −1.5 V (Pulse width less than $t_{CYC}/2$).
16. All Voltage referenced to Ground.

TAP AC Switching Characteristics

Over the Operating Range

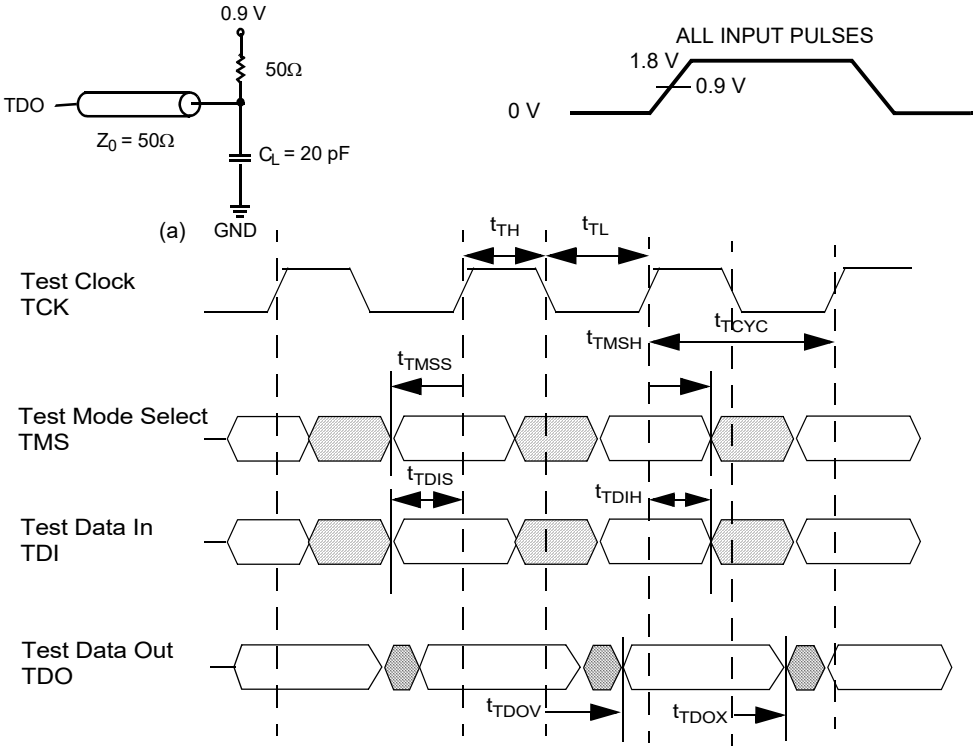
Parameter [17, 18]	Description	Min	Max	Unit
t_{TCYC}	TCK clock cycle time	50	–	ns
t_{TF}	TCK clock frequency	–	20	MHz
t_{TH}	TCK clock HIGH	20	–	ns
t_{TL}	TCK clock LOW	20	–	ns
Setup Times				
t_{TMSS}	TMS setup to TCK clock rise	5	–	ns
t_{TDIS}	TDI setup to TCK clock rise	5	–	ns
t_{CS}	Capture setup to TCK rise	5	–	ns
Hold Times				
t_{TMSH}	TMS hold after TCK clock rise	5	–	ns
t_{TDIH}	TDI hold after clock rise	5	–	ns
t_{CH}	Capture hold after clock rise	5	–	ns
Output Times				
t_{TDOV}	TCK clock LOW to TDO valid	–	10	ns
t_{TDOX}	TCK clock LOW to TDO invalid	0	–	ns

Notes
17. t_{CS} and t_{CH} refer to the setup and hold time requirements of latching data from the boundary scan register.
18. Test conditions are specified using the load in TAP AC Test Conditions. t_R/t_F = 1 ns.

TAP Timing and Test Conditions

Figure 3 shows the TAP timing and test conditions. [19]

Figure 3. TAP Timing and Test Conditions



Note
19. Test conditions are specified using the load in TAP AC Test Conditions. t_R/t_F = 1 ns.

Identification Register Definitions

Instruction Field	Value		Description
	CYRS1543AV18	CYRS1545AV18	
Revision number (31:29)	000	000	Version number.
Cypress device ID (28:12)	11010010101010100	11010010101100100	Defines the type of SRAM.
Cypress JEDEC ID (11:1)	00000110100	00000110100	Allows unique identification of SRAM vendor.
ID register presence (0)	1	1	Indicates the presence of an ID register.

Scan Register Sizes

Register Name	Bit Size

Power Up Sequence in QDR II+ SRAM

QDR II+ SRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

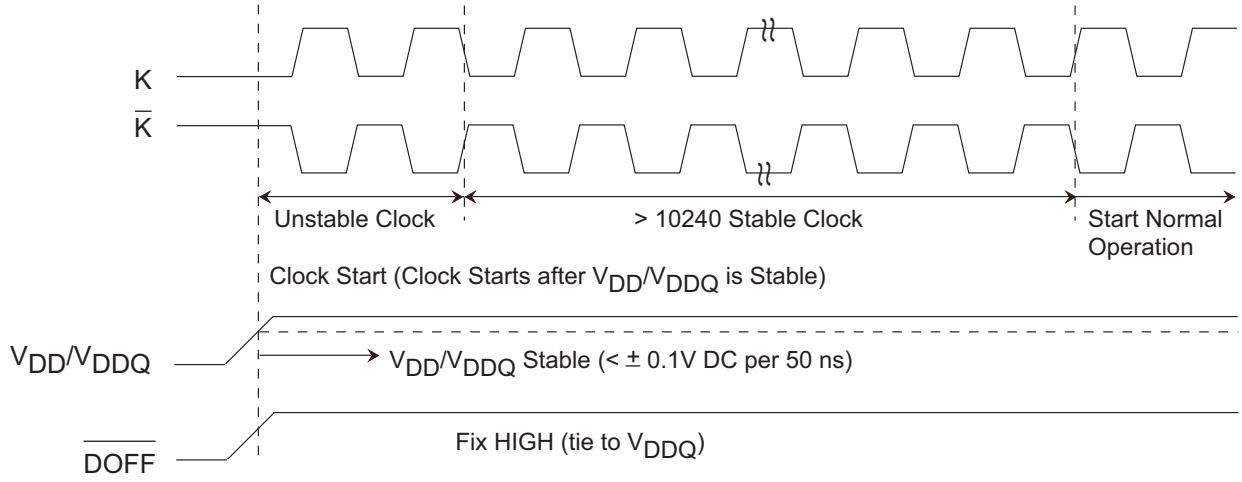
Power Up Sequence

- Apply power and drive $\overline{DOFF}$ either HIGH or LOW (All other inputs can be HIGH or LOW).
  - Apply V_{DD} before V_{DDQ}.
  - Apply V_{DDQ} before V_{REF} or at the same time as V_{REF}.
  - Drive $\overline{DOFF}$ HIGH.
- Provide stable $\overline{DOFF}$ (HIGH), power and clock (K, $\overline{K}$) for 10240 cycles to lock the DLL.

DLL Constraints

- DLL uses K clock as its synchronizing input. The input must have low phase jitter, which is specified as $t_{KC\ Var}$.
- The DLL functions at frequencies down to 120 MHz.
- If the input clock is unstable and the DLL is enabled, then the DLL may lock onto an incorrect frequency, causing unstable SRAM behavior. To avoid this, provide 10240 cycles stable clock to relock to the desired clock frequency.

Figure 4. Power Up Waveforms



Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature ..... –65 °C to +150 °C

Case temperature under power ..... –55 °C to +125 °C

Junction temperature under power ..... –55 °C to +155 °C

Supply voltage on V_{DD} relative to GND .....–0.5 V to +2.9 V

Supply voltage on V_{DDQ} relative to GND ..... –0.5 V to +V_{DD}

DC applied to outputs in high Z .....–0.5 V to V_{DDQ} + 0.3 V

DC input voltage [20] ..... –0.5 V to V_{DD} + 0.3 V

Current into outputs (LOW) ..... 20 mA

Static discharge voltage (MIL-STD-883, TM. 3015) ..... > 2001 V

Latch-up current ..... > 200 mA

Operating Range

Range	Case Temperature (T_c)	V_{DD}[21]	V_{DDQ}[21]
Military	–55 °C to +125 °C	1.8 ± 0.1 V	1.4 V to V_{DD}

Electrical Characteristics

Over the Operating Range

DC Electrical Characteristics

Over the Operating Range

Parameter [22]	Description	Test Conditions			Min	Typ	Max	Unit
V_{DD}	Power supply voltage				1.7	1.8	1.9	V

				(× 36)	–	–	1275	
I_{SB1}	Automatic power down current	Max V_{DD}, Both Ports Deselected, $V_{IN} \ge V_{IH}$ or $V_{IN} \le V_{IL}$, $f = f_{MAX} = 1/t_{CYC}$, T_J = 125 °C, Inputs Static	250 MHz	(× 18)	–	–	570	mA
				(× 36)	–	–	570	

Notes

20. Overshoot: $V_{IH(AC)} < V_{DDQ} + 0.85$ V (Pulse width less than $t_{CYC}/2$), Undershoot: $V_{IL(AC)} > -1.5$ V (Pulse width less than $t_{CYC}/2$).
21. Power up: Assumes a linear ramp from 0 V to $V_{DD(min)}$ within 200 ms. During this time $V_{IH} < V_{DD}$ and $V_{DDQ} \le V_{DD}$.
22. All Voltage referenced to Ground.
23. Output are impedance controlled. $I_{OH} = -(V_{DDQ}/2)/(RQ/5)$ for values of $175\ \Omega \le RQ \le 350\ \Omega$.
24. Output are impedance controlled. $I_{OL} = (V_{DDQ}/2)/(RQ/5)$ for values of $175\ \Omega \le RQ \le 350\ \Omega$.
25. $V_{REF(min)}$ = 0.68 V or 0.46 V_{DDQ}, whichever is larger, $V_{REF(max)}$ = 0.95 V or 0.54 V_{DDQ}, whichever is smaller.
26. The operation current is calculated with concurrent read and write cycles.

V_{IL}	Input Low voltage		–	–	V_{REF} – 0.2	V

Radiation Performance

Parameter	Test Conditions	Limits	Unit
Total dose	T_A = 25 °C, V_{DD} = V_{DDQ} = 1.8 V	300 Krad	Rads(Si) Co60
Soft error rate	T_A = 25 °C to 125 °C, V_{DD} = V_{DDQ} = 1.8 V w/ EDAC	1.0 × 10^-10	Upsets/bit-day
Transient dose rate upset	Pulse Width (FWHM) = 50 ns, X-Ray, T_C = 25 °C, V_{DD} = V_{DDQ} = 1.8 V	2.0 × 10^9	Rads(Si)/s
Neutron fluence	1 MeV equivalent energy, Unbiased T_A = 25 °C	2e14	N/cm^2
Latch up immunity	T_A = 125 °C, V_{DD} = V_{DDQ} = 1.9 V	110	$MeVcm^2/mg$

Capacitance

Parameter [29]	Description	Test Conditions	Max	Unit
C_{IN}	Input capacitance	T_A = 25 °C, f = 1 MHz, V_{DD} = 1.8 V, V_{DDQ} = 1.5 V	10	pF
C_{CLK}	Clock input capacitance		10	pF
C_O	Output capacitance		10	pF

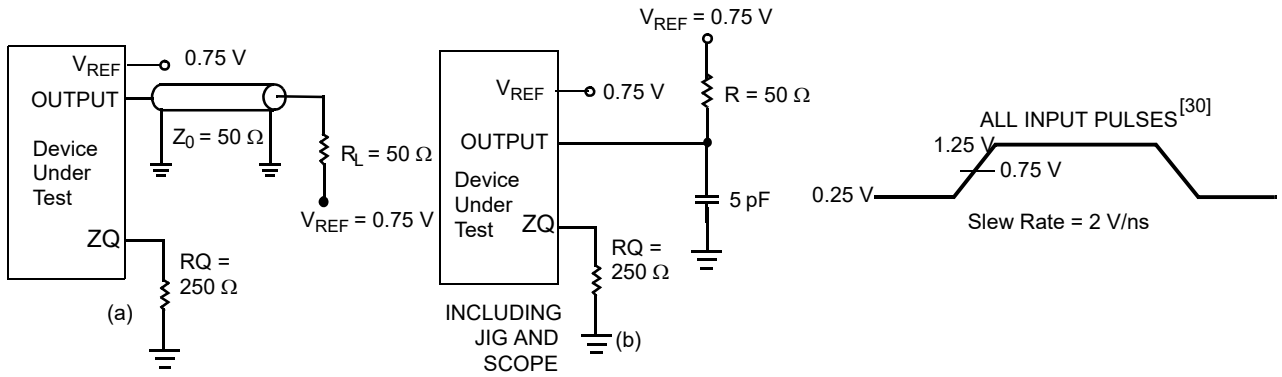
Thermal Resistance

Parameter [29]	Description	Test Conditions	165-ball CCGA Package	Unit
Θ_{JC}	Thermal resistance (junction to case)	Test conditions follow standard test methods and procedures for measuring thermal impedance, in accordance with EIA/JESD51.	8.9	°C/W

Notes
27. Overshoot: $V_{IH(AC)} < V_{DDQ} + 0.85$ V (Pulse width less than $t_{CYC}/2$), Undershoot: $V_{IL(AC)} > -1.5$ V (Pulse width less than $t_{CYC}/2$).
28. Power up: Assumes a linear ramp from 0 V to $V_{DD(min)}$ within 200 ms. During this time $V_{IH} < V_{DD}$ and $V_{DDQ} \leq V_{DD}$.
29. Tested initially and after any design or process change that may affect these parameters.

AC Test Loads and Waveforms

Figure 5. AC Test Loads and Waveforms



Note

30. Unless otherwise noted, test conditions are based on signal transition time of 2 V/ns, timing reference levels of 0.75 V, Vref = 0.75 V, RQ = 250 Ω, V_{DDQ} = 1.5 V, input pulse levels of 0.25 V to 1.25 V, and output loading of the specified I_{OL}/I_{OH} and load capacitance shown in (a) of Figure 5.

Switching Characteristics

Over the Operating Range

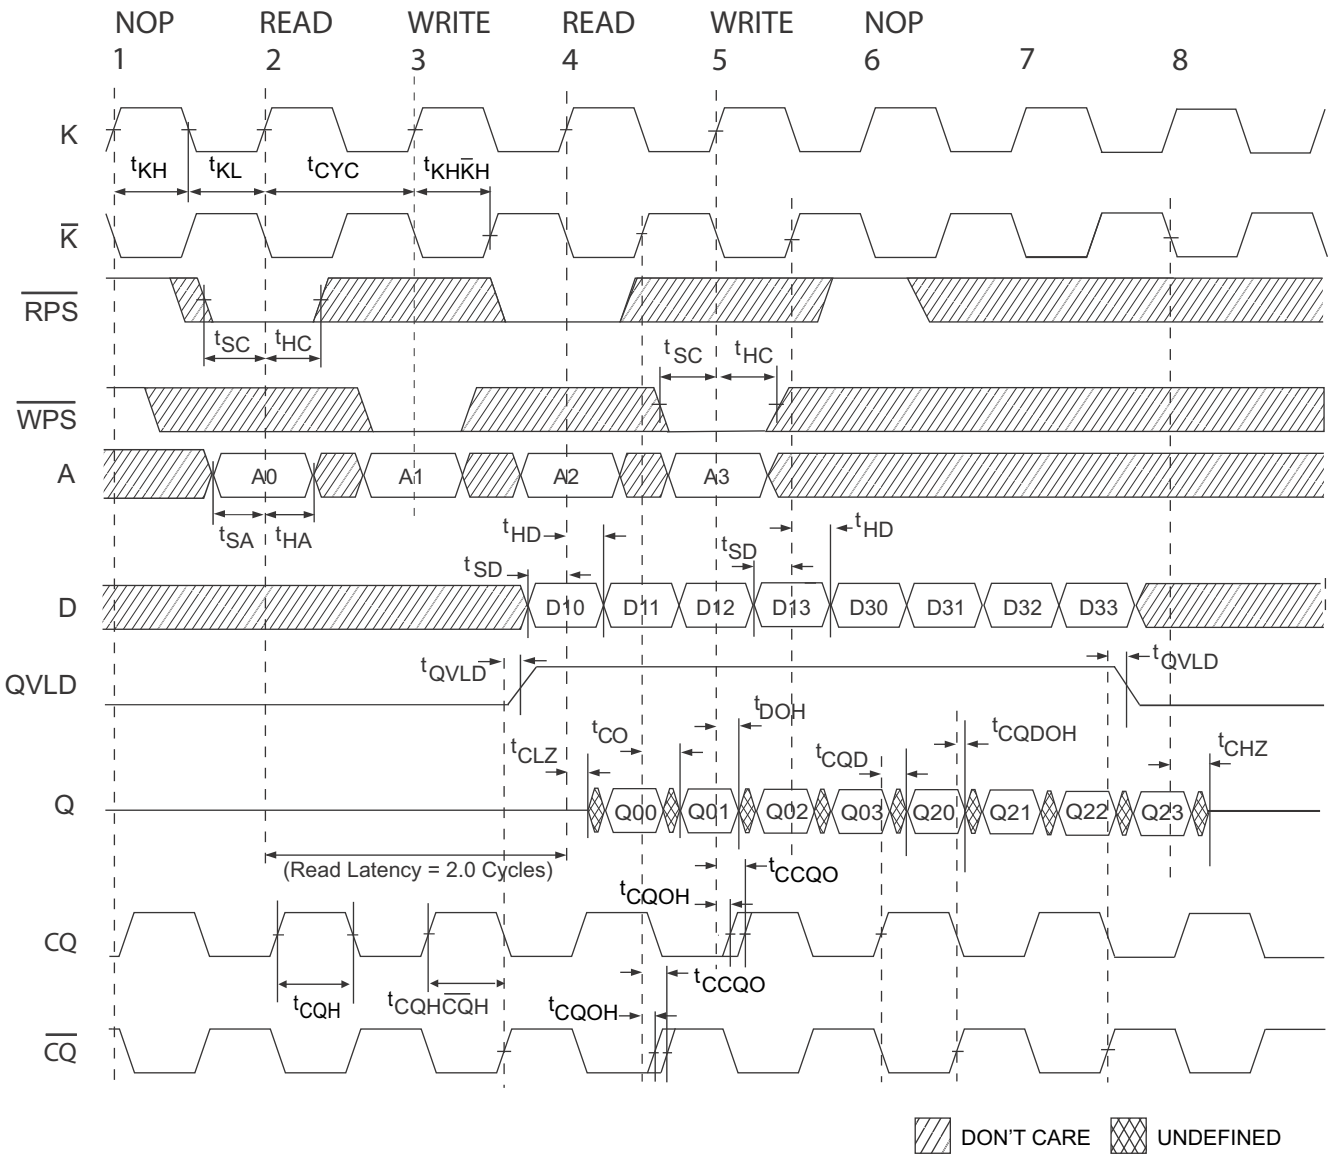
Parameters [31, 32]		Description	250 MHz		Unit
Cypress Parameter	Consortium Parameter		Min	Max	
t_{POWER}		V_{DD}(typical) to the first access [33]	1	–	ms
t_{CYC}	t_{KHKH}	K clock cycle time	4.0	8.4	ns
t_{KH}	t_{KHKL}	Input clock (K/$\overline{K}$) HIGH	1.6	–	ns
t_{KL}	t_{KLKH}	Input clock (K/$\overline{K}$) LOW	1.6	–	ns
$t_{KH\overline{K}H}$	$t_{KH\overline{K}H}$	K clock rise to $\overline{K}$ clock rise (rising edge to rising edge)	1.8	–	ns
Setup Times					
t_{SA}	t_{AVKH}	Address setup to K clock rise	0.5	–	ns
t_{SC}	t_{IVKH}	Control setup to K clock rise ($\overline{RPS}$, $\overline{WPS}$)	0.5	–	ns
t_{SCDDR}	t_{IVKH}	DDR control setup to clock (K/$\overline{K}$) rise ($\overline{BWS}_0$, $\overline{BWS}_1$, $\overline{BWS}_2$, $\overline{BWS}_3$)	0.5	–	ns
t_{SD} [34]	t_{DVKH}	$D_{[X:0]}$ setup to clock (K/$\overline{K}$) rise	0.5	–	ns
Hold Times					
t_{HA}	t_{KHAX}	Address hold after K clock rise	0.5	–	ns
t_{HC}	t_{KHIX}	Control hold after K clock rise ($\overline{RPS}$, $\overline{WPS}$)	0.5	–	ns
t_{HCDDR}	t_{KHIX}	DDR control hold after clock (K/$\overline{K}$) rise ($\overline{BWS}_0$, $\overline{BWS}_1$, $\overline{BWS}_2$, $\overline{BWS}_3$)	0.5	–	ns
t_{HD}	t_{KHDX}	$D_{[X:0]}$ hold after clock (K/$\overline{K}$) rise	0.5	–	ns
Output Times					
t_{CO}	t_{CHQV}	K/$\overline{K}$ clock rise to data valid	–	0.85	ns
t_{DOH}	t_{CHQX}	Data output hold after output K/$\overline{K}$ clock rise (Active to active)	–0.85	–	ns
t_{CCQO}	t_{CHCQV}	K/$\overline{K}$ clock rise to echo clock valid	–	0.85	ns
t_{CQOH}	t_{CHCQX}	Echo clock hold after C/$\overline{C}$ clock rise	–0.5	–	ns
t_{CQD}	t_{CQHQV}	Echo clock high to data valid	–	0.5	ns
t_{CQDOH}	t_{CQHQX}	Echo clock high to data invalid	–0.30	–	ns
t_{CQH}	t_{CQHCQL}	Output clock (CQ/$\overline{CQ}$) HIGH [34]	1.55	–	ns
$t_{CQH\overline{CQ}H}$	$t_{CQH\overline{CQ}H}$	CQ clock rise to $\overline{CQ}$ clock rise (rising edge to rising edge)[34]	1.55	–	ns
t_{CHZ}	t_{CHQZ}	Clock (K/$\overline{K}$) rise to high Z (Active to high Z) [35, 36]	–	0.45	ns
t_{CLZ}	t_{CHQX1}	Clock (K/$\overline{K}$) rise to low Z [35, 36]	–0.45	–	ns
t_{QVLD}	$t_{CQHQVLD}$	Echo Clock High to QVLD Valid [37]	–0.5	0.5	ns
DLL Timing					
$t_{KC\ Var}$	$t_{KC\ Var}$	Clock phase jitter	–	0.2	ns
$t_{KC\ lock}$	$t_{KC\ lock}$	DLL lock time (K)	10240	–	Cycles
$t_{KC\ Reset}$	$t_{KC\ Reset}$	K static to DLL reset	30	–	ns

Notes

31. Unless otherwise noted, test conditions are based on signal transition time of 2 V/ns, timing reference levels of 0.75 V, Vref = 0.75 V, RQ = 250 Ω, V_{DDQ} = 1.5 V, input pulse levels of 0.25 V to 1.25 V, and output loading of the specified I_{OL}/I_{OH} and load capacitance shown in (a) of Figure 5 on page 24.
32. When a part with a maximum frequency above 167 MHz is operating at a lower clock frequency, it requires the input timings of the frequency range in which it is being operated and outputs data with the output timings of that frequency range.
33. This part has a voltage regulator internally; t_{POWER} is the time that the power must be supplied above $V_{DD(minimum)}$ initially before a read or write operation can be initiated.
34. These parameters are extrapolated from the input timing parameters ($t_{KH\overline{K}H}$ – 250 ps, where 250 ps is the internal jitter. An input jitter of 200 ps ($t_{KC\ Var}$) is already included in the $t_{KH\overline{K}H}$). These parameters are only guaranteed by design and are not tested in production
35. t_{CHZ}, t_{CLZ}, are specified with a load capacitance of 5 pF as in (b) of Figure 5 on page 24. Transition is measured ± 100 mV from steady-state voltage.
36. At any voltage and temperature t_{CHZ} is less than t_{CLZ} and t_{CHZ} less than t_{CO}.
37. t_{QVLD} Spec is applicable for both rising and falling edges of QVLD signal.

Switching Waveforms

Figure 6. Read/Write/Deselect Sequence [38, 39, 40]



Notes

38. Q00 refers to output from address A0. Q01 refers to output from the next internal burst address following A0, that is, A0 + 1.
39. Outputs are disabled (high Z) one clock cycle after a NOP.
40. In this example, if address A2 = A1, then data Q20 = D10, Q21 = D11, Q22 = D12, and Q23 = D13. Write data is forwarded immediately as read results. This note applies to Figure 6.

Ordering Information

The following table contains only the parts that are currently available. If you do not see what you are looking for (× 18 option), contact your local sales representative. For more information, visit the Cypress website at www.cypress.com and refer to the product summary page at http://www.cypress.com/products.

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at http://www.cypress.com/go/datasheet/offices.

Speed (MHz)	Ordering Code	Description	Package Diagram	Package Type	Operating Range
250	CYRS1543AV18-250GCMB	72M QDR II+, × 18, Burst of 4	001-58969	165-ball CCGA (21 × 25 × 2.83 mm)	Military
250	CYRS1545AV18-250GCMB	72M QDR II+, × 36, Burst of 4	001-58969	165-ball CCGA (21 × 25 × 2.83 mm)	Military

Acronyms

Acronym	Description
$\overline{BWS}$	byte write select
CCGA	ceramic column grid array
DED	double error detection
DLL	delay lock loop
DDR	double data rate
DSCC	defense supply center columbus
EDAC	error detection and correction
HSTL	high speed transceiver logic
I/O	input/output
JTAG	Joint Test Action Group
LSB	least significant bit
LSBU	logical single-bit upsets
LMBU	logical multi-bit upsets
MSB	most significant bit
PDA	percent defect allowable
PIND	particle impact noise detection
PDA	percent defective allowable
QDR	quad data rate
$\overline{RPS}$	read port select
SEC	single error correction
SEL	single event latch up
SRAM	static random access memory
TAP	test access port
TCK	test clock
TDI	test data in
TDO	test data out
TMS	test mode select
$\overline{WPS}$	write port select

Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
Krad	kiloradian
MHz	megahertz
µA	microampere
µF	microfarad
µs	microsecond
mA	milliampere
mm	millimeter
ms	millisecond
mV	millivolt
N/cm^2	Neutron particles fluence per cm^2 area
ns	nanosecond
nm	nanometer
Ω	ohm
%	percent
pF	picofarad
ps	picosecond
Rads(Si)	unit of absorbed radiation energy from ionizing radiation per kg of material. (1 rad(Si)) = 10 mGy = 10 – 2 J/kg
V	volt
W	watt

Glossary

Total Dose	Permanent device damage due to ions over device life
Heavy Ion	Instantaneous device latch up due to single ion
LET	Linear energy transfer (measured in $MeVcm^2$)
Krad	Unit of measurement to determine device life in radiation environments.
Neutron	Permanent device damage due to energetic neutrons or protons
Prompt Dose	Data loss of permanent device damage due to X-rays and gamma rays < 20 ns
165-ball Ceramic Column Grid Array	Hermetic ceramic 165-column package. Columns attached by Six Sigma
RadStop Technology	Cypress's patented Rad Hard design methodology
DLAM	Defense Logistics Agency Land and Maritime
LSBU	Logical Single Bit Upset. Single bits in a single correction word are in error.
LMBU	Logical Multi Bit Upset. Multiple bits in a single correction word are in error.
Group A	General electrical testing
Group B	Mechanical - Dimensions, bond strength, solvents, die shear, solderability, lead integrity, seal, acceleration
Group C	Life test - 1000 hours at 125 °C
Group D	Package related mechanical tests - shock, vibration, Accel, salt, seal, lead finish adhesion, lid torque, thermal shock, moisture resistance
Group E	Radiation testing

Document History Page

Document Title: CYRS1543AV18/CYRS1545AV18, 72-Mbit QDR® II+ SRAM Four-Word Burst Architecture with RadStop™ Technology Document Number: 001-60007				
Rev.	**ECN No.**	**Orig. of Change**	**Submission Date**	**Description of Change**
**	2940931	HRP	05/31/2010	New data sheet.
*A	3016545	HRP	08/26/2010	Changed part numbers from CYRS1513AV18, CYRS1515AV18 to reflect change to QDR II+ die. Updated Switching Characteristics (Updated minimum and maximum values for Setup Time, Hold Time parameters, and updated minimum and maximum values for t_{CO} parameter under Output Time parameter). Updated Package Diagrams: spec 001-58969 – Changed revision from ** to *A. Added Units of Measure.
*B	3281455	HRP	06/13/2011	Changed status from Advanced to Final. Replaced 2048 with 10240 for DLL lockup cycles in all instances across the document. Updated Configurations (corrected typo). Updated Selection Guide. Updated DC Electrical Characteristics (maximum current limit values for the parameters IDD and ISB1 based on device characterization). Updated Radiation Performance (Limits of Radiation Data based on RHA qualification). Updated Thermal Resistance. Updated Switching Characteristics (Minimum and Maximum timing values for the parameters t_{CO}, t_{DOH}, t_{CCQO}, t_{CQOH} based on device characterization. Updated Ordering Information (Removed × 18 option from ordering table). Updated Package Diagrams: spec 001-58969 – Changed revision from *A to *C. Updated to new template.
*C	3471321	HRP	12/21/2011	Updated Identification Register Definitions (Replaced the value of Cypress device ID (28:12) from 11010011011010100 to 11010010101010100 for CYRS1543AV18 and replaced the value of Cypress device ID (28:12) from 11010011011100100 to 11010010101100100 for CYRS1545AV18).
*D	3524961	HRP	02/14/2012	Updated Prototyping Options under Radiation Performance (Added two devices). Updated Selection Guide (Removed 200 MHz option). Updated Application Example. Updated Truth Table. Updated Maximum Ratings. Updated Operating Range. Updated Radiation Performance. Updated Capacitance. Updated Thermal Resistance. Updated Switching Characteristics.
*E	3537277	HRP	02/29/2012	Updated Radiation Data under Radiation Performance. Updated Ordering Information (Updated part numbers).
*F	3617759	HRP	05/15/2012	Updated Ordering Information (Updated part numbers). Updated Glossary. Completing Sunset Review.
*G	3640834	HRP	06/08/2012	Updated Radiation Performance (Updated Prototyping Options). Renamed the section Class V Flow as Manufacturing Flow. Updated Glossary.
*H	3857750	HRP	01/04/2013	Updated Ordering Information (Updated part numbers).

Document History Page (continued)

Document Title: CYRS1543AV18/CYRS1545AV18, 72-Mbit QDR® II+ SRAM Four-Word Burst Architecture with RadStop™ Technology
Document Number: 001-60007

Rev.	ECN No.	Orig. of Change	Submission Date	Description of Change
*I	3900846	HRP	02/11/2013	Updated Neutron Soft Error Immunity (Changed value of Test Conditions of SEL parameter from 85 °C to 125 °C). Updated Pin Definitions (Changed Pin Name from A to $A_{[x:0]}$). Updated Functional Overview (Updated Qualification and Screening (Replaced Class V with Class Q)). Updated Application Example (Replaced four with two).
*J	3934155	MISA	03/15/2013	Updated Selection Guide: Changed Maximum operating current (125 °C, concurrent R/W) corresponding to "× 18" for 250 MHz frequency from 1225 mA to 1275 mA. Changed Maximum operating current (125 °C, concurrent R/W) corresponding to "× 36" for 250 MHz frequency from 1225 mA to 1275 mA. Updated Electrical Characteristics: Updated DC Electrical Characteristics: Changed maximum value of I_{DD} parameter corresponding to "× 18" for 250 MHz frequency from 1225 mA to 1275 mA. Changed maximum value of I_{DD} parameter corresponding to "× 36" for 250 MHz frequency from 1225 mA to 1275 mA. Changed maximum value of I_{SB1} parameter corresponding to "× 18" for 250 MHz frequency from 510 mA to 570 mA. Changed maximum value of I_{SB1} parameter corresponding to "× 36" for 250 MHz frequency from 510 mA to 570 mA. Removed 200 MHz frequency related information. Updated Switching Characteristics: Changed maximum value of t_{CO} and t_{CHQV} parameters from 0.7 ns to 0.85 ns. Changed minimum value of t_{DOH} and t_{CHQX} parameters from –0.7 ns to –0.85 ns. Changed maximum value of t_{CCQO} and t_{CHCQV} parameters from 0.7 ns to 0.85 ns. Changed minimum value of t_{CQOH} and t_{CHCQX} parameters from –0.7 ns to –0.5 ns. Removed 200 MHz frequency related information. Updated Package Diagrams: spec 001-58969 – Changed revision from *C to *D.
*K	4286754	MISA	02/21/2014	Updated Functional Overview: Updated Qualification and Screening: Replaced "Class Q" with "Class Q, Class V". Updated Ordering Information (Updated part numbers). Updated to new template.
*L	4618500	PRIT	01/09/2015	Updated Radiation Performance: Updated Radiation Data: Updated 2nd bulleted point. Updated Functional Description: Added "For a complete list of related resources, click here." at the end. Updated Pin Definitions: Updated description of CQ and $\overline{CQ}$ pins. Updated Functional Overview: Updated description. Updated Read Operations: Updated description. Updated Write Operations: Updated description. Updated Application Example: Updated Figure 2.
