

# DS2148/DS21Q48 5V E1/T1/J1 Line Interface Unit

[www.maxim-ic.com](http://www.maxim-ic.com)

## FEATURES

- Complete E1, T1, or J1 Line Interface Unit (LIU)
- Supports Both Long- and Short-Haul Trunks
- Internal Software-Selectable Receive-Side Termination for 75Ω/100Ω/120Ω
- 5V Power Supply
- 32-Bit or 128-Bit Crystal-Less Jitter Attenuator Requires Only a 2.048MHz Master Clock for Both E1 and T1 with Option to Use 1.544MHz for T1
- Generates the Appropriate Line Build-Outs, With and Without Return Loss, for E1 and DSX-1 and CSU Line Build-Outs for T1
- AMI, HDB3, and B8ZS, Encoding/Decoding
- 16.384MHz, 8.192MHz, 4.096MHz, or 2.048MHz Clock Output Synthesized to Recovered Clock
- Programmable Monitor Mode for Receiver
- Loopbacks and PRBS Pattern Generation/ Detection with Output for Received Errors
- Generates/Detects In-Band Loop Codes, 1 to 16 Bits including CSU Loop Codes
- 8-Bit Parallel or Serial Interface with Optional Hardware Mode
- Multiplexed and Nonmultiplexed Parallel Bus Supports Intel or Motorola
- Detects/Generates Blue (AIS) Alarms
- NRZ/Bipolar Interface for Tx/Rx Data I/O
- Transmit Open-Circuit Detection
- Receive Carrier Loss (RCL) Indication (G.775)
- High-Z State for TTIP and TRING
- 50mA (RMS) Current Limiter

## PIN CONFIGURATION

## ORDERING INFORMATION

| PART      | CHANNEL | TEMP RANGE     | PIN-PACKAGE |
|-----------|---------|----------------|-------------|
| DS2148TN  | Single  | -40°C to +85°C | 44 TQFP     |
| DS2148TN+ | Single  | -40°C to +85°C | 44 TQFP     |
| DS2148T   | Single  | 0°C to +70°C   | 44 TQFP     |
| DS2148T+  | Single  | 0°C to +70°C   | 44 TQFP     |
| DS2148GN  | Single  | -40°C to +85°C | 49 CSBGA    |
| DS2148GN+ | Single  | -40°C to +85°C | 49 CSBGA    |
| DS2148G   | Single  | 0°C to +70°C   | 49 CSBGA    |
| DS2148G+  | Single  | 0°C to +70°C   | 49 CSBGA    |
| DS21Q48N  | Four    | -40°C to +85°C | 144 CSBGA   |
| DS21Q48   | Four    | 0°C to +70°C   | 144 CSBGA   |

+ Denotes lead-free/RoHS-compliant package.

**Note:** Some revisions of this device may incorporate deviations from published specifications known as errata. Multiple revisions of any device may be simultaneously available through various sales channels. For information about device errata, click here: [www.maxim-ic.com/errata](http://www.maxim-ic.com/errata).

# 1 DETAILED DESCRIPTION

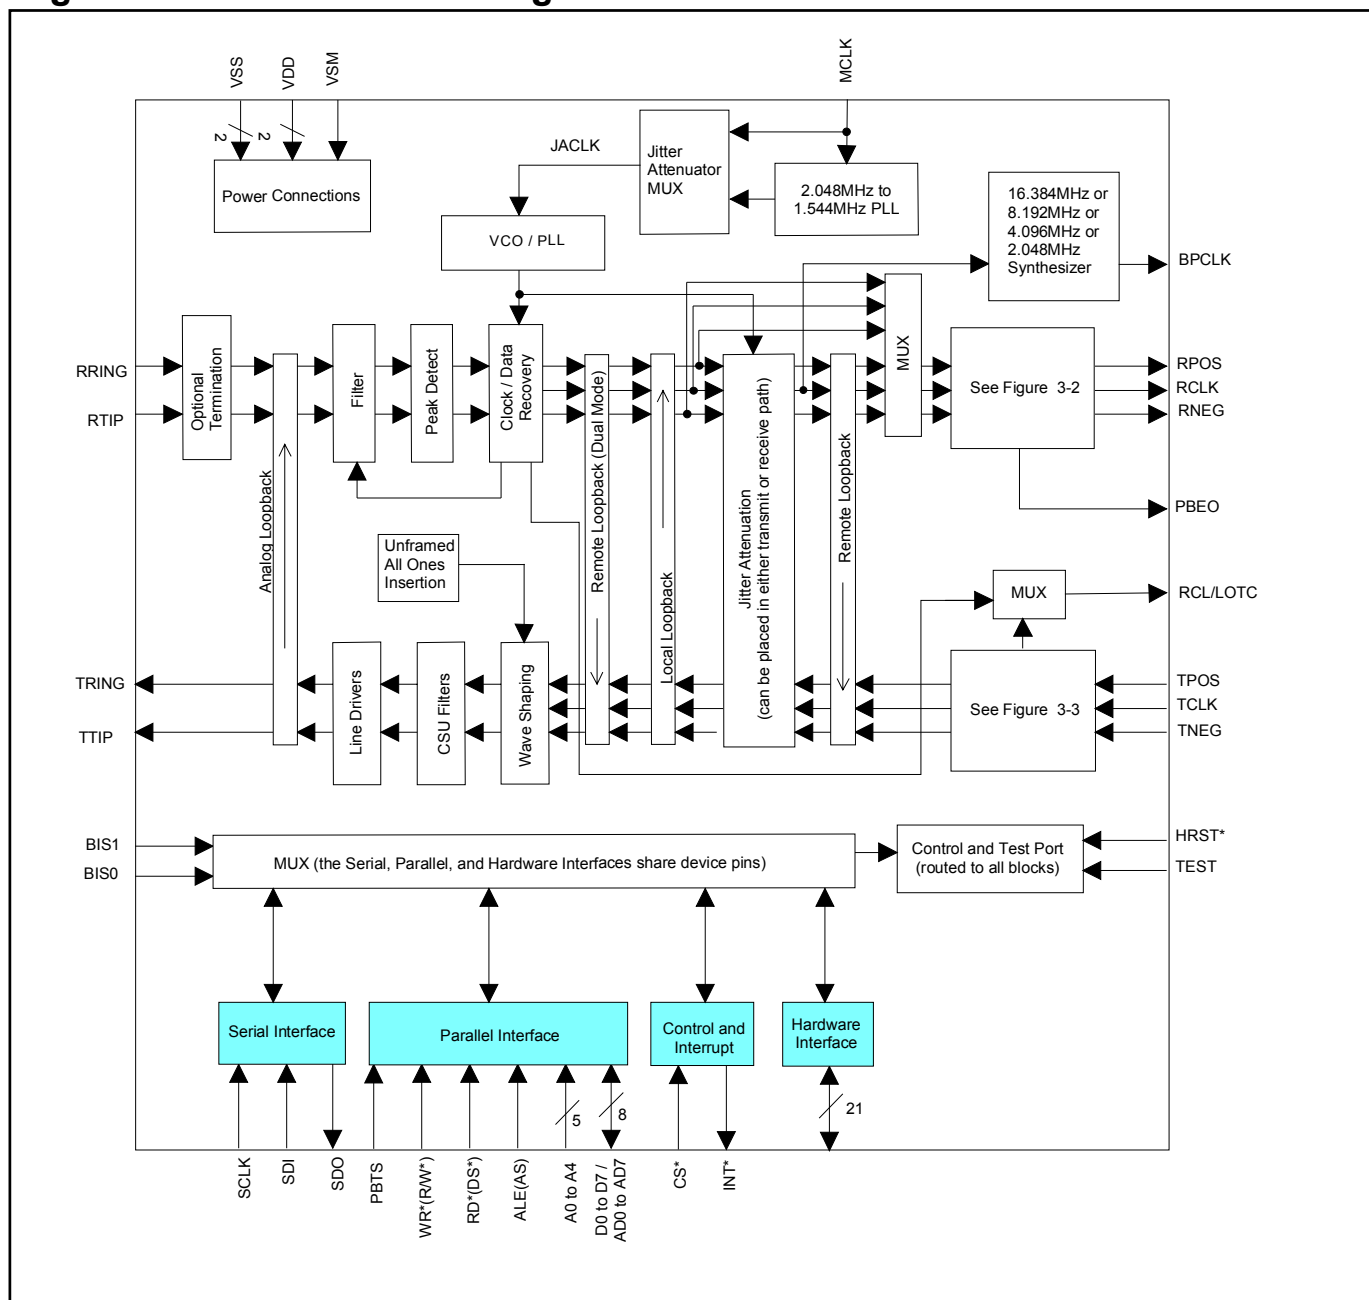

The DS2148 is a complete selectable E1 or T1 Line Interface Unit (LIU) for short- and long-haul applications. Throughout the data sheet, J1 is represented wherever T1 exists. Receive sensitivity adjusts automatically to the incoming signal and can be programmed for 0dB to 12dB or 0dB to 43dB for E1 applications and 0dB to 30dB or 0dB to 36dB for T1 applications. The device can generate the necessary G.703 E1 waveshapes in 75Ω or 120Ω applications and DSX-1 line built-outs or CSU line built-outs of 0dB, -7.5dB, -15dB, and -22.5dB for T1 applications. The crystal-less onboard jitter attenuator requires only a 2.048MHz MCLK for both E1 and T1 applications (with the option of using a 1.544MHz MCLK in T1 applications). The jitter attenuator FIFO is selectable to either 32 bits or 128 bits in depth and can be placed in either the transmit or receive data paths. An X 2.048MHz output clock synthesized to RCLK is available for use as a backplane system clock (where n = 1, 2, 4, or 8). The DS2148 has diagnostic capabilities such as loopbacks and PRBS pattern generation/detection. 16-bit loop-up and loop-down codes can be generated and detected. The device can be controlled via an 8-bit parallel muxed or nonmuxed port, serial port or used in hardware mode. The device fully meets all of the latest E1 and T1 specifications including ANSI T1.403-1999, ANSI T1.408, AT&T TR 62411, ITU G.703, G.704, G.706, G.736, G.775, G.823, I.431, O.151, O.161, ETSI ETS 300 166, JTG.703, JTL431, JJ-20.1, TBR12, TBR13, and CTR4.

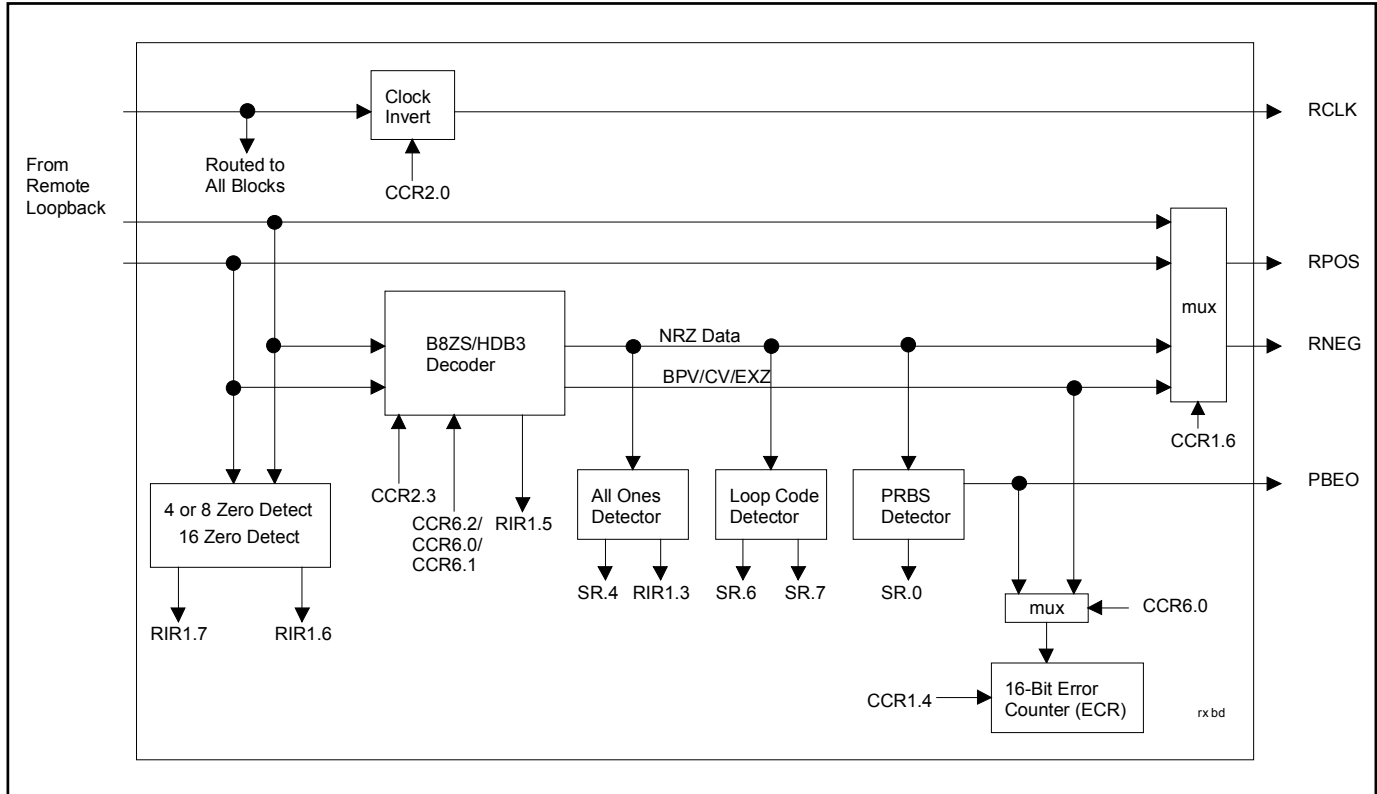

## 1.1 Function Description

The analog AMI/HDB3 waveform off the E1 line or the AMI/B8ZS waveform off the T1 line is transformer coupled into the RTIP and RRING pins of the DS2148. The user has the option to use internal software-selectable receive-side termination for 75Ω/100Ω/120Ω applications or external termination. The device recovers clock and data from the analog signal and passes it through the jitter attenuation MUX outputting the received line clock at RCLK and bipolar or NRZ data at RPOS and RNEG. The DS2148 contains an active filter that reconstructs the analog-received signal for the nonlinear losses that occur in transmission. The receive circuitry also is configurable for various monitor applications. The device has a usable receive sensitivity of 0dB to -43dB (E1) and 0dB to -36dB (T1), which allows the device to operate on 0.63mm (22AWG) cables up to 2.5km (E1) and 6k feet (T1) in length. Data input at TPOS and TNEG is sent via the jitter attenuation MUX to the waveshaping circuitry and line driver. The DS2148 will drive the E1 or T1 line from the TTIP and TRING pins via a coupling transformer. The line driver can handle both CEPT 30/ISDN-PRI lines for E1 and long-haul (CSU) or short-haul (DSX-1) lines for T1.

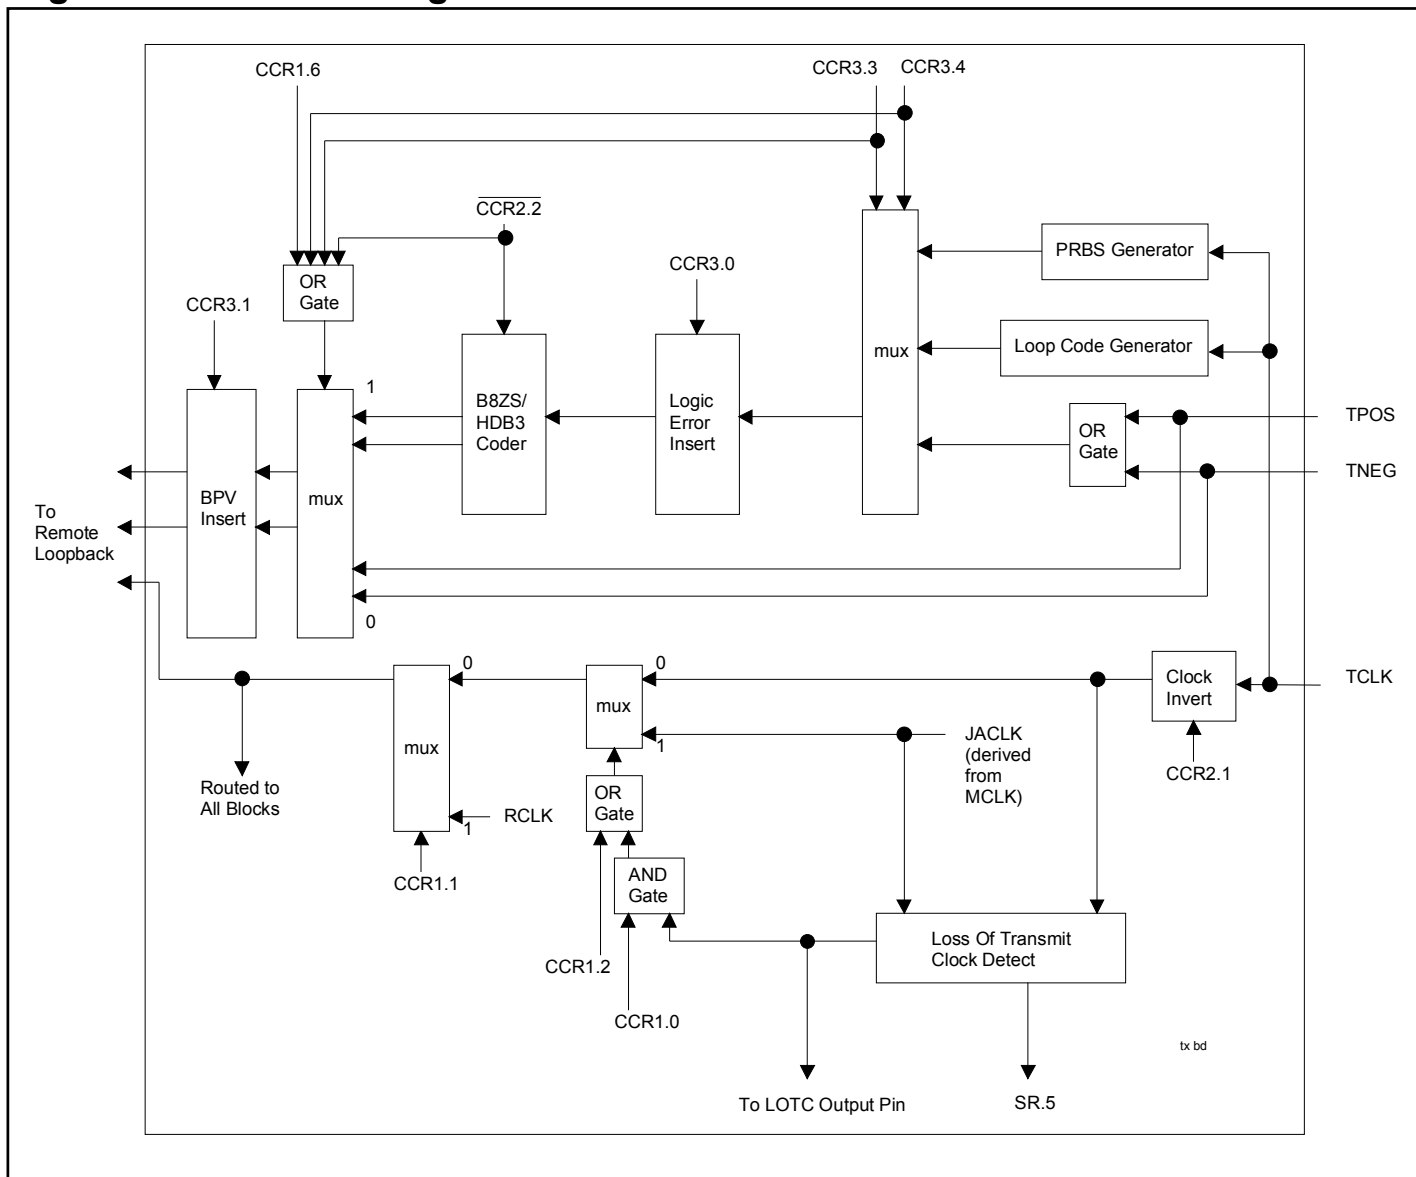

## 1.2 Document Revision History

- 1) 100Ω/60Ω termination reversed in *Internal Rx Termination Select* tables, 091799.
- 2) Add DS21Q48 pinout, 092899.
- 3) Correct VSM pin number in Q48 (12 x 12 BGA) from G5 to G4, 120699.
- 4) Add timing diagram for Status Register (write access mode); Add mechanical dimensions for the quad version, 032900.
- 5) Timing diagram for Status Register (write access mode) added; elaboration on burst mode bit; add mechanical dimensions for the quad version, 050300.
- 6) Changes to datasheet to indicate 5V only part, 011801.
- 7) Added supply current measurement; added thermal characteristics of quad package, 092001.
- 8) Corrected typos and removed instances of 3V operation, 082504.
- 9) In *Absolute Maximum Ratings*, changed the spec for soldering temperature from IPC/JEDEC J-STD-020A to J-STD-020; defined the storage temperature range as –55°C to +125°C.
- 10) Added lead-free packages to Ordering Information table on page 1; updated style of data sheet, 011206.

## 2 PIN DESCRIPTION

The DS2148 can be controlled in a parallel port mode, a serial port mode, or a hardware mode ([Table 2-1](#), [Table 2-2](#), and [Table 2-3](#)). The parallel and serial port modes are described in Section [3.2](#) and [3.3](#), and the hardware mode is described below.

**Table 2-1. Bus Interface Selection**

| BIS1 | BIS0 | PBTS | BUS INTERFACE TYPE |
|------|------|------|--------------------|
| 0    | 0    | 0    | Muxed Intel        |
| 0    | 0    | 1    | Muxed Motorola     |
| 0    | 1    | 0    | Nonmuxed Intel     |
| 0    | 1    | 1    | Nonmuxed Motorola  |
| 1    | 0    | -    | Serial Port        |
| 1    | 1    | -    | Hardware           |

**Table 2-3. Pin Descriptions in Parallel Port Mode (Sorted by Pin Name, DS2148T)**

| NAME                           | PIN            | I/O | FUNCTION  |
|--------------------------------|----------------|-----|---|
| A0<br>to<br>A4                 | 11<br>to<br>7  | I   | <b>Address Bus.</b> In nonmultiplexed bus operation (BIS1 = 0, BIS0 = 1), serves as the address bus. In multiplexed bus operation (BIS1 = 0, BIS0 = 0), these pins are not used and should be tied low.   |
| ALE(AS)                        | 4              | I   | <b>Address Latch Enable (Address Strobe).</b> When using the parallel port (BIS1 = 0) in multiplexed bus mode (BIS0 = 0), serves to demultiplex the bus on a positive-going edge. In nonmultiplexed bus mode (BIS0 = 1), should be tied low.  |
| BIS0/BIS1                      | 32/33          | I   | <b>Bus Interface Select Bits 0 &amp; 1.</b> Used to select bus interface option. See <a href="#">Table 2-1</a> for details.   |
| BPCLK                          | 31             | O   | <b>Backplane Clock.</b> A 16.384MHz, 8.192MHz, 4.096MHz, or 2.048MHz clock output that is referenced to RCLK selectable via CCR5.7 and CCR5.6. In hardware mode, defaults to 16.384MHz output.  |
| CS                             | 1              | I   | <b>Active-Low Chip Select.</b> Must be low to read or write to the device.  |
| D0/AD0<br>to<br>D7/AD7         | 19<br>to<br>12 | I/O | <b>Data Bus/Address/Data Bus.</b> In non-multiplexed bus operation (BIS1 = 0, BIS0 = 1), serves as the data bus. In multiplexed bus operation (BIS1 = 0, BIS0 = 0), serves as an 8-bit multiplexed address/data bus.  |
| HRST                           | 29             | I   | <b>Active-Low Hardware Reset.</b> Bringing HRST low will reset the DS2148 setting all control bits to their default state of all zeros.   |
| INT                            | 23             | O   | <b>Active-Low Interrupt.</b> Flags host controller during conditions and change of conditions defined in the Status Register. Active low, open drain output.  |
| MCLK                           | 30             | I   | <b>Master Clock.</b> A 2.048MHz ( $\pm 50$ ppm) clock source with TTL levels is applied at this pin. This clock is used internally for both clock/data recovery and for jitter attenuation. Use of a T1 1.544MHz clock source is optional.<br>See Note 1 on clock accuracy at the end of this table.  |
| NA                             | -              | I   | <b>Not Assigned.</b> Should be tied low.  |
| PBEO                           | 24             | O   | <b>PRBS Bit Error Output.</b> The receiver will constantly search for a $2^{15}-1$ or a $2^{20}-1$ PRBS depending on the ETS bit setting (CCR1.7). Remains high if out of synchronization with the PRBS pattern. Goes low when synchronized to the PRBS pattern. Any errors in the received pattern after synchronization will cause a positive going pulse (with same period as E1 or T1 clock) synchronous with RCLK. PRBS bit errors can also be reported to the ECR1 and ECR2 registers by setting CCR6.2 to a logic 1. |
| PBTS                           | 44             | I   | <b>Parallel Bus Type Select.</b> When using the parallel port (BIS1 = 0), set high to select Motorola bus timing, set low to select Intel bus timing. This pin controls the function of the $\overline{RD}(\overline{DS})$ , ALE(AS), and $\overline{WR}(\overline{R/\overline{W}})$ pins. If PBTS = 1 and BIS1 = 0, then these pins assume the Motorola function listed in parenthesis (). In serial port mode, this pin should be tied low.   |
| RCLK                           | 40             | O   | <b>Receive Clock.</b> Buffered recovered clock from the line. Synchronous to MCLK in absence of signal at RTIP and RRING.   |
| $\overline{RD}(\overline{DS})$ | 2              | I   | <b>Active-Low Read Input (Data Strobe).</b> DS is active low when in nonmultiplexed, Motorola mode. See the bus timing diagrams in <a href="#">Section 10</a> .   |
| RCL/LOTC                       | 25             | O   | <b>Receive Carrier Loss/Loss of Transmit Clock.</b> An output which will toggle high during a receive carrier loss (CCR2.7 = 0) or will toggle high if the TCLK pin has not been toggled for $5\mu s \pm 2\mu s$ (CCR2.7 = 1). CCR2.7 defaults to logic 0 when in hardware mode.  |

| NAME            | PIN   | I/O | FUNCTION   |
|-----------------|-------|-----|--|
| RNEG            | 39    | O   | <b>Receive Negative Data.</b> Updated on the rising edge (CCR2.0 = 0) or the falling edge (CCR2.0 = 1) of RCLK with the bipolar data out of the line interface. Set NRZE (CCR1.6) to a one for NRZ applications. In NRZ mode, data will be output on RPOS while a received error will cause a positive-going pulse synchronous with RCLK at RNEG. See Section <a href="#">6.4</a> for details. |
| RPOS            | 38    | O   | <b>Receive Positive Data.</b> Updated on the rising edge (CCR2.0 = 0) or the falling edge (CCR2.0 = 1) of RCLK with bipolar data out of the line interface. Set NRZE (CCR1.6) to a one for NRZ applications. In NRZ mode, data will be output on RPOS while a received error will cause a positive-going pulse synchronous with RCLK at RNEG. See Section <a href="#">6.2</a> for details.     |
| RTIP/RRING      | 27/28 | I   | <b>Receive Tip and Ring.</b> Analog inputs for clock recovery circuitry. These pins connect via a 1:1 transformer to the line. See Section <a href="#">5</a> for details.  |
| TCLK            | 43    | I   | <b>Transmit Clock.</b> A 2.048MHz or 1.544MHz primary clock. Used to clock data through the transmit side formatter. Can be sourced internally by MCLK or RCLK. See Common Control Register 1 and <a href="#">Figure 1-3</a> .   |
| TEST            | 26    | I   | <b>Tri-state Control.</b> Set high to tri-state all outputs and I/O pins (including the parallel control port). Set low for normal operation. Useful in board level testing.   |
| TNEG            | 42    | I   | <b>Transmit Negative Data.</b> Sampled on the falling edge (CCR2.1 = 0) or the rising edge (CCR2.1 = 1) of TCLK for data to be transmitted out onto the line.  |
| TPOS            | 41    | I   | <b>Transmit Positive Data.</b> Sampled on the falling edge (CCR2.1 = 0) or the rising edge (CCR2.1 = 1) of TCLK for data to be transmitted out onto the line.  |
| TTIP/TRING      | 34/37 | O   | <b>Transmit Tip and Ring.</b> Analog line driver outputs. These pins connect via a step-up transformer to the line. See Section <a href="#">5</a> for details.   |
| V <sub>DD</sub> | 21/36 | -   | <b>5.0V ±5% Positive Supply</b>  |
| VSM             | 20    | I   | <b>Voltage Supply Mode.</b> Should be tied high for 5V operation   |
| V <sub>SS</sub> | 22/35 | -   | <b>Signal Ground</b>   |
| WR<br>(R/W)     | 3     | I   | <b>Active-Low Write Input (Read/Write).</b> See the bus timing diagrams in Section <a href="#">10</a> .  |

**Table 2-5. Pin Descriptions in Serial Port Mode (Sorted by Pin Name, DS2148T)**

| NAME                     | PIN   | I/O | FUNCTION  |
|--------------------------|-------|-----|---|
| BIS0/BIS1                | 32/33 | I   | <b>Bus Interface Select Bits 0 &amp; 1.</b> Used to select bus interface option. See <a href="#">Table 2-1</a> for details.   |
| BPCLK                    | 31    | O   | <b>Backplane Clock.</b> A 16.384MHz, 8.192MHz, 4.096MHz, or 2.048MHz clock output that is referenced to RCLK selectable via CCR5.7 and CCR5.6. In hardware mode, defaults to 16.384MHz output.  |
| $\overline{\text{CS}}$   | 1     | I   | <b>Active-Low Chip Select.</b> Must be low to read or write to the device.  |
| $\overline{\text{HRST}}$ | 29    | I   | <b>Hardware Reset.</b> Bringing $\overline{\text{HRST}}$ low will reset the DS2148 setting all control bits to their default state of all zeros.  |
| ICES                     | 8     | I   | <b>Input Clock Edge Select.</b> Selects whether the serial port data input (SDI) is sampled on rising (ICES = 0) or falling edge (ICES = 1) of SCLK.  |
| $\overline{\text{INT}}$  | 23    | O   | <b>Active-Low Interrupt.</b> Flags host controller during conditions and change of conditions defined in the Status Register. Active low, open drain output.  |
| MCLK                     | 30    | I   | <b>Master Clock.</b> A 2.048MHz ( $\pm 50$ ppm) clock source with TTL levels is applied at this pin. This clock is used internally for both clock/data recovery and for jitter attenuation. Use of a T1 1.544MHz clock source is optional. See Note 1 on clock accuracy at the end of this table.   |
| NA                       | -     | I   | <b>Not Assigned.</b> Should be tied low.  |
| OCES                     | 9     | I   | <b>Output Clock Edge Select.</b> Selects whether the serial port data output (SDO) is valid on the rising (OCES = 1) or falling edge (OCES = 0) of SCLK.  |
| PBEO                     | 24    | O   | <b>PRBS Bit Error Output.</b> The receiver will constantly search for a $2^{15}-1$ or a $2^{20}-1$ PRBS depending on the ETS bit setting (CCR1.7). Remains high if out of synchronization with the PRBS pattern. Goes low when synchronized to the PRBS pattern. Any errors in the received pattern after synchronization will cause a positive going pulse (with same period as E1 or T1 clock) synchronous with RCLK. PRBS bit errors can also be reported to the ECR1 and ECR2 registers by setting CCR6.2 to a logic 1. |
| RCLK                     | 40    | O   | <b>Receive Clock.</b> Buffered recovered clock from the line. Synchronous to MCLK in absence of signal at RTIP and RRING.   |
| RCL/LOTC                 | 25    | O   | <b>Receive Carrier Loss/Loss of Transmit Clock.</b> An output which will toggle high during a receive carrier loss (CCR2.7 = 0) or will toggle high if the TCLK pin has not been toggled for $5\mu\text{s} \pm 2\mu\text{s}$ (CCR2.7 = 1). CCR2.7 defaults to logic 0 when in hardware mode.  |
| RNEG                     | 39    | O   | <b>Receive Negative Data.</b> Updated on the rising edge (CCR2.0 = 0) or the falling edge (CCR2.0 = 1) of RCLK with the bipolar data out of the line interface. Set NRZE (CCR1.6) to a one for NRZ applications. In NRZ mode, data will be output on RPOS while a received error will cause a positive-going pulse synchronous with RCLK at RNEG. See Section <a href="#">6.4</a> for details.  |
| RPOS                     | 38    | O   | <b>Receive Positive Data.</b> Updated on the rising edge (CCR2.0 = 0) or the falling edge (CCR2.0 = 1) of RCLK with bipolar data out of the line interface. Set NRZE (CCR1.6) to a one for NRZ applications. In NRZ mode, data will be output on RPOS while a received error will cause a positive-going pulse synchronous with RCLK at RNEG. See Section <a href="#">6.4</a> for details.  |
| RTIP/RRING               | 27/28 | I   | <b>Receive Tip and Ring.</b> Analog inputs for clock recovery circuitry. These pins connect via a 1:1 transformer to the line. See Section <a href="#">5</a> for details.   |
| SCLK                     | 5     | I   | <b>Serial Clock.</b> Serial bus clock input.  |

| NAME            | PIN   | I/O | FUNCTION   |
|-----------------|-------|-----|--|
| SDI             | 6     | I   | <b>Serial Data Input.</b> Sampled on rising edge (ICES = 0) or the falling edge (ICES = 1) of SCLK.  |
| SDO             | 7     | O   | <b>Serial Data Output.</b> Valid on the falling edge (OCES = 0) or the rising edge (OCES = 1) of SCLK.   |
| TCLK            | 43    | I   | <b>Transmit Clock.</b> A 2.048 MHz or 1.544 MHz primary clock. Used to clock data through the transmit side formatter. Can be sourced internally by MCLK or RCLK. See Common Control Register 1 and <a href="#">Figure 1-3</a> . |
| TEST            | 26    | I   | <b>Tri-State Control.</b> Set high to tri-state all outputs and I/O pins (including the parallel control port). Set low for normal operation. Useful in board level testing.   |
| TNEG            | 42    | I   | <b>Transmit Negative Data.</b> Sampled on the falling edge (CCR2.1 = 0) or the rising edge (CCR2.1 = 1) of TCLK for data to be transmitted out onto the line.  |
| TPOS            | 41    | I   | <b>Transmit Positive Data.</b> Sampled on the falling edge (CCR2.1 = 0) or the rising edge (CCR2.1 = 1) of TCLK for data to be transmitted out onto the line.  |
| TTIP/TRING      | 34/37 | O   | <b>Transmit Tip and Ring .</b> Analog line driver outputs. These pins connect via a step-up transformer to the line. See Section <a href="#">5</a> for details.  |
| V <sub>DD</sub> | 21/36 | -   | <b>5.0V ±5% Positive Supply</b>  |
| VSM             | 20    | I   | <b>Voltage Supply Mode.</b> Should be tied high for 5V operation.  |
| V <sub>SS</sub> | 22/35 | -   | <b>Signal Ground</b>   |

| ETS                      | 2     | I   | <b>E1/T1 Select.</b><br>0 = E1<br>1 = T1  |
| HBE                      | 11    | I   | <b>Receive &amp; Transmit HDB3/B8ZS Enable.</b><br>0 = enable HDB3 (E1)/B8ZS (T1)<br>1 = disable HDB3 (E1)/B8ZS (T1)  |
| $\overline{\text{HRST}}$ | 29    | I   | <b>Hardware Reset.</b> Bringing $\overline{\text{HRST}}$ low will reset the DS2148.   |
| JAMUX                    | 9     | I   | <b>Jitter Attenuator MUX.</b> Controls the source for JACLK. See <a href="#">Figure 1-1</a> and <a href="#">Table 2-13</a> .<br><b>E1 (ETS = 0) JAMUX</b><br>MCLK = 2.048MHz 0<br><b>T1 (ETS = 1)</b><br>MCLK = 2.048MHz 1<br>MCLK = 1.544MHz 0   |
| JAS                      | 10    | I   | <b>Jitter Attenuator Select</b><br>0 = place the jitter attenuator on the receive side<br>1 = place the jitter attenuator on the transmit side  |
| L0/L1/L2                 | 7/6/5 | I   | <b>Transmit LIU Waveshape Select Bits 0 &amp; 1 [H/W Mode].</b> These inputs determine the waveshape of the transmitter. See <a href="#">Table 7-1</a> and <a href="#">Table 7-2</a> .  |
| LOOP0/LOOP1              | 16/17 | I   | <b>Loopback Select Bits 0 &amp; 1 [H/W Mode].</b> These inputs determine the active loopback mode (if any). See <a href="#">Table 2-8</a> .   |
| MCLK                     | 30    | I   | <b>Master Clock.</b> A 2.048MHz ( $\pm 50$ ppm) clock source with TTL levels is applied at this pin. This clock is used internally for both clock/data recovery and for jitter attenuation. Use of a T1 1.544MHz clock source is optional. G.703 requires an accuracy of $\pm 50$ ppm for both T1 and E1. TR62411 and ANSI specs require an accuracy of $\pm 32$ ppm for T1 interfaces. |
| MM0/MM1                  | 18/19 | I   | <b>Monitor Mode Select Bits 0 &amp; 1 [H/W Mode].</b> These inputs determine if the receive equalizer is in a monitor mode. See <a href="#">Table 2-11</a> .  |
| NA                       | -     | I   | <b>Not Assigned.</b> Should be tied low.  |

| NAME            | PIN   | I/O | FUNCTION   |
|-----------------|-------|-----|--|
| NRZE            | 3     | I   | <b>NRZ Enable [H/W Mode]</b><br>0 = Bipolar data at RPOS/RNEG and TPOS/TNEG<br>1 = NRZ data at RPOS and TPOS or TNEG; RNEG outputs a positive going pulse when device receives a BPV, CV, or EXZ.  |
| PBEO            | 24    | O   | <b>PRBS Bit Error Output.</b> The receiver will constantly search for a QRSS (T1) or a $2^{15}-1$ (E1) PRBS depending on whether T1 or E1 mode is selected. Remains high if out of synchronization with the PRBS pattern. Goes low when synchronized to the PRBS pattern. Any errors in the received pattern after synchronization will cause a positive going pulse (with same period as E1 or T1 clock) synchronous with RCLK. |
| RCLK            | 40    | O   | <b>Receive Clock.</b> Buffered recovered clock from the line. Synchronous to MCLK in absence of signal at RTIP and RRING.  |
| RCL             | 25    | O   | <b>Receive Carrier Loss.</b> An output which will toggle high during a receive carrier loss.   |
| RNEG            | 39    | O   | <b>Receive Negative Data.</b> Updated on the rising edge (CES = 0) or the falling edge (CES = 1) of RCLK with the bipolar data out of the line interface. Set NRZE to a one for NRZ applications. In NRZ mode, data will be output on RPOS while a received error will cause a positive-going pulse synchronous with RCLK at RNEG. See Section 6.4 for details.  |
| RPOS            | 38    | O   | <b>Receive Positive Data.</b> Updated on the rising edge (CES = 0) or the falling edge (CES = 1) of RCLK with bipolar data out of the line interface. Set NRZE pin to a one for NRZ applications. In NRZ mode, data will be output on RPOS while a received error will cause a positive-going pulse synchronous with RCLK at RNEG. See Section 6.4 for details.  |
| RT0/RT1         | 44/23 | I   | <b>Receive LIU Termination Select Bits 0 &amp; 1 [H/W Mode].</b> These inputs determine the receive termination. See Table 2-12.   |
| RTIP/RRING      | 27/28 | I   | <b>Receive Tip and Ring.</b> Analog inputs for clock recovery circuitry. These pins connect via a 1:1 transformer to the line. See Section 5 for details.  |
| SCLKE           | 4     | I   | <b>Receive &amp; Transmit Synchronization Clock Enable.</b><br>0 = disable 2.048MHz synchronization transmit and receive mode<br>1 = enable 2.048MHz synchronization transmit and receive mode   |
| TCLK            | 43    | I   | <b>Transmit Clock.</b> A 2.048MHz or 1.544MHz primary clock. Used to clock data through the transmit side formatter.   |
| TEST            | 26    | I   | <b>Tri-State Control.</b> Set high to tri-state all outputs and I/O pins (including the parallel control port). Set low for normal operation. Useful in board level testing.   |
| TNEG            | 42    | I   | <b>Transmit Negative Data.</b> Sampled on the falling edge (CES = 0) or the rising edge (CES = 1) of TCLK for data to be transmitted out onto the line.  |
| TPD             | 13    | I   | <b>Transmit Power-Down</b><br>0 = normal transmitter operation<br>1 = powers down the transmitter and tri-states the TTIP and TRING pins   |
| TPOS            | 41    | I   | <b>Transmit Positive Data.</b> Sampled on the falling edge (CES = 0) or the rising edge (CES = 1) of TCLK for data to be transmitted out onto the line.  |
| TTIP/TRING      | 34/37 | O   | <b>Transmit Tip and Ring.</b> Analog line driver outputs. These pins connect via a step-up transformer to the line. See Section 5 for details.   |
| TX0/TX1         | 14/15 | I   | <b>Transmit Data Source Select Bits 0 &amp; 1 [H/W Mode].</b> These inputs determine the source of the transmit data. See Table 2-9.   |
| V <sub>DD</sub> | 21/36 | -   | <b>5.0V ±5% Positive Supply</b>  |
| VSM             | 20    | I   | <b>Voltage Supply Mode.</b> Should be tied high for 5V operation   |
| V <sub>SS</sub> | 22/35 | -   | <b>Signal Ground</b>   |

**Note 1:** G.703 requires an accuracy of  $\pm 50\text{ppm}$  for both T1 and E1. TR62411 and ANSI specs require an accuracy of  $\pm 32\text{ppm}$  for T1 interfaces.

**Table 2-8. Loopback Control in Hardware Mode**

| LOOPBACK        | SYMBOL | CONTROL BIT | LOOP1 | LOOP0 |
|-----------------|--------|-------------|-------|-------|
| Remote Loopback | RLB    | CCR6.6      | 1     | 1     |
| Local Loopback  | LLB    | CCR6.7      | 1     | 0     |
| Analog Loopback | ALB    | CCR6.4      | 0     | 1     |
| No Loopback     | –      | –           | 0     | 0     |

**Table 2-9. Transmit Data Control in Hardware Mode**

| TRANSMIT DATA                       | SYMBOL | CONTROL BIT | TX1 | TX0 |
|-------------------------------------|--------|-------------|-----|-----|
| Transmit Unframed All Ones          | TUA1   | CCR3.7      | 1   | 1   |
| Transmit Alternating Ones and Zeros | TAOZ   | CCR3.5      | 1   | 0   |

**Operation**

### 3 HARDWARE MODE

In hardware mode (BIS1 = 1, BIS0 = 1), pins 1-19, 23, 25, 31, and 44 are redefined to be used for initializing the DS2148. BPCLK (pin 31) defaults to a 16.384MHz output when in hardware mode. The RCL/LOTCL (pin 25) is designated to RCL when in hardware mode. JABDS (CCR4.2) defaults to logic 0. The RHBE (CCR2.3) and THBE (CCR2.2) control bits are combined and controlled by HBE at pin 11 while the RSCLKE (CCR5.3) and TSCLKE (CCR5.2) bits are combined and controlled by SCLKE at pin 4. TCES (CCR2.1) and RCES (CCR2.0) are combined and controlled by CES at pin 12. The transmitter functions are combined and controlled by TX1 (pin 15) and TX0 (pin 14). LOOP1 (pin 17) and LOOP0 (pin 16) control the loopback functions. All other control bits default to the logic 0 setting.

#### 3.1 Register Map

**Table 3-1. Register Map**

| NAME   | REGISTER NAME                           | R/W | PARALLEL<br>PORT MODE | SERIAL PORT<br>MODE        |

#### NOTES:

- 1) Register addresses 16h to 1Fh do not exist.
- 2) In the Serial Port Mode, the LSB is on the right hand side.
- 3) In the Serial Port Mode, data is read and written LSB first.
- 4) In the Serial Port Mode, the A bit (the LSB) determines whether the access is a read (A = 1) or a write (A = 0).
- 5) In the Serial Port Mode, the B bit (the MSB) determines whether the access is a burst access (B = 1) or a single register access (B = 0).

## 3.2 Parallel Port Operation

When using the parallel interface on the DS2148 ( $BIS1 = 0$ ) the user has the option for either multiplexed bus operation ( $BIS1 = 0, BIS0 = 0$ ) or nonmultiplexed bus operation ( $BIS1 = 0, BIS0 = 1$ ). The DS2148 can operate with either Intel or Motorola bus timing configurations. If the PBTS pin is tied low, Intel timing will be selected; if tied high, Motorola timing will be selected. All Motorola bus signals are listed in parentheses. See the timing diagrams in Section [10](#) for more details.

## 3.3 Serial Port Operation

Setting  $BIS1 = 1$  and  $BIS0 = 0$  enables the serial bus interface on the DS2148. Port read/write timing is unrelated to the system transmit and receive timing, allowing asynchronous reads or writes by the host. See Section [10](#) for the AC timing of the serial port. All serial port accesses are LSB first. See [Figure 3-1](#), [Figure 3-2](#), [Figure 3-3](#), and [Figure 3-4](#) for more details.

Reading or writing to the internal registers requires writing one address/command byte prior to transferring register data. The first bit written (LSB) of the address/command byte specifies whether the access is a read (1) or a write (0). The next 5 bits identify the register address. Bit 7 is reserved and must be set to 0 for proper operation.

The last bit (MSB) of the address/command byte is the burst mode bit. When the burst bit is enabled ( $B = 1$ ) and a READ operation is performed, addresses 0 through 15h are read sequentially, starting at address 0h. And when the burst bit is enabled and a WRITE operation is performed, addresses 0 through 16h are written sequentially, starting at address 0h. Burst operation is stopped once address 15h is read. See [Figure 3-5](#) and [Figure 3-6](#) for more details.

All data transfers are initiated by driving the  $\overline{CS}$  input low. When input clock-edge select (ICES) is low, input data is latched on the rising edge of SCLK and when ICES is high, input data is latched on the falling edge of SCLK. When output clock-edge select (OCES) is low, data is output on the falling edge of SCLK and when OCES is high, data is output on the rising edge of SCLK. Data is held until the next falling or rising edge. All data transfers are terminated if the  $\overline{CS}$  input transitions high. Port control logic is disabled and SDO is tri-stated when  $\overline{CS}$  is high.

### Figure 3-1. Serial Port Operation for Read Access (R = 1) Mode 1

## 4 CONTROL REGISTERS

### CCR1 (00H): COMMON CONTROL REGISTER 1

| (MSB) |      |      |      | (LSB) |      |      |         |
|-------|------|------|------|-------|------|------|---------|
| ETS   | NRZE | RCLA | ECUE | JAMUX | TTOJ | TTOR | LOTCCMC |

| SYMBOL  | POSITION | DESCRIPTION  |
|---------|----------|--|
| ETS     | CCR1.7   | <b>E1/T1 Select.</b><br>0 = E1<br>1 = T1   |
| NRZE    | CCR1.6   | <b>NRZ Enable.</b><br>0 = Bipolar data at RPOS/RNEG and TPOS/TNEG<br>1 = NRZ data at RPOS and TPOS or TNEG; RNEG outputs a positive going pulse when device receives a BPV, CV, or EXZ. See <a href="#">Figure 1-2</a> and <a href="#">Figure 1-3</a> .  |
| RCLA    | CCR1.5   | <b>Receive Carrier Loss Alternate Criteria.</b><br>0 = RCL declared upon 255 (E1) or 192 (T1) consecutive zeros<br>1 = RCL declared upon 2048 (E1) or 1544 (T1) consecutive zeros  |
| ECUE    | CCR1.4   | <b>Error Counter Update Enable.</b> A 0 to 1-transition forces the next clock cycle to load the error counter registers with the latest counts and reset the counters. The user must wait a minimum of two clocks cycles (976ns for E1 and 1296ns for T1) before reading the error count registers to allow for a proper update. See Section 4 and <a href="#">Figure 1-2</a> for details. |
| JAMUX   | CCR1.3   | <b>Jitter Attenuator MUX.</b> Controls the source for JACLK. See <a href="#">Figure 1-1</a> .<br>0 = JACLK sourced from MCLK (2.048MHz or 1.544MHz at MCLK)<br>1 = JACLK sourced from internal PLL (2.048MHz at MCLK)  |
| TTOJ    | CCR1.2   | <b>TCLK to JACLK.</b> Internally connects TCLK to JACLK. See <a href="#">Figure 1-3</a> .<br>0 = disabled<br>1 = enabled   |
| TTOR    | CCR1.1   | <b>TCLK to RCLK.</b> Internally connects TCLK to RCLK. See <a href="#">Figure 1-3</a> .<br>0 = disabled<br>1 = enabled   |
| LOTCCMC | CCR1.0   | <b>Loss Of Transmit Clock Mux Control.</b> Determines whether the transmit logic should switch to JACLK if the TCLK input should fail to transition. See <a href="#">Figure 1-3</a> .<br>0 = do not switch to JACLK if TCLK stops<br>1 = switch to JACLK if TCLK stops   |

**Table 4-1. MCLK Selection**

| MCLK     | JAMUX<br>(CCR1.3) | ETS<br>(CCR1.7) |
|----------|-------------------|-----------------|
| 2.048MHz | 0                 | 0               |
| 2.048MHz | 1                 | 1               |
| 1.544MHz | 0                 | 1               |

**CCR2 (01H): COMMON CONTROL REGISTER 2**

| (MSB) |     |      |      | (LSB) |      |      |      |
|-------|-----|------|------|-------|------|------|------|
| P25S  | N/A | SCLD | CLDS | RHBE  | THBE | TCES | RCES |

| SYMBOL | POSITION | DESCRIPTION  |
|--------|----------|--|
| P25S   | CCR2.7   | <b>Pin 25 Select.</b> Forced to logic 0 in hardware mode.<br>0 = toggles high during a Receive Carrier Loss condition<br>1 = toggles high if TCLK does not transition for at least 5 $\mu$ s.  |
| -      | CCR2.6   | <b>Not Assigned. Should be set to zero when written to.</b>  |
| SCLD   | CCR2.5   | <b>Short Circuit Limit Disable (ETS = 0).</b> Controls the 50mA (RMS) current limiter.<br>0 = enable 50mA current limiter<br>1 = disable 50mA current limiter  |
| CLDS   | CCR2.4   | <b>Custom Line Driver Select.</b> Setting this bit to a one will redefine the operation of the transmit line driver. When this bit is set to a one and CCR4.5 = CCR4.6 = CCR4.7 = 0, then the device will generate a square wave at the TTIP and TRING outputs instead of a normal waveform. When this bit is set to a one and CCR4.5 = CCR4.6 = CCR4.7 $\neq$ 0, then the device will force TTIP and TRING outputs to become open drain drivers instead of their normal push-pull operation. <b>This bit should be set to zero for normal operation of the device.</b> Contact the factory for more details on how to use this bit. |
| RHBE   | CCR2.3   | <b>Receive HDB3/B8ZS Enable.</b> See <a href="#">Figure 1-2</a> .<br>0 = enable HDB3 (E1)/B8ZS (T1)<br>1 = disable HDB3 (E1)/B8ZS (T1)   |
| THBE   | CCR2.2   | <b>Transmit HDB3/B8ZS Enable.</b> See <a href="#">Figure 1-3</a> .<br>0 = enable HDB3 (E1)/B8ZS (T1)<br>1 = disable HDB3 (E1)/B8ZS (T1)  |
| TCES   | CCR2.1   | <b>Transmit Clock Edge Select.</b> Selects which TCLK edge to sample TPOS and TNEG. See <a href="#">Figure 1-3</a> .<br>0 = sample TPOS and TNEG on falling edge of TCLK<br>1 = sample TPOS and TNEG on rising edge of TCLK  |
| RCES   | CCR2.0   | <b>Receive Clock Edge Select.</b> Selects which RCLK edge to update RPOS and RNEG. See <a href="#">Figure 1-2</a> .<br>0 = update RPOS and RNEG on rising edge of RCLK<br>1 = update RPOS and RNEG on falling edge of RCLK   |

**CCR3 (02H): COMMON CONTROL REGISTER 3**

| (MSB) |       |      |        | (LSB) |       |      |     |
|-------|-------|------|--------|-------|-------|------|-----|
| TUA1  | ATUA1 | TAOZ | TPRBSE | TLCE  | LIRST | IBPV | IBE |

| SYMBOL | POSITION | DESCRIPTION   |
|--------|----------|---|
| TUA1   | CCR3.7   | <b>Transmit Unframed All Ones.</b> The polarity of this bit is set such that the device will transmit an all ones pattern on power-up or device reset. This bit must be set to a one to allow the device to transmit data. The transmission of this data pattern is always timed off of the JACLK (See <a href="#">Figure 1-1</a> ).<br>0 = transmit all ones at TTIP and TRING<br>1 = transmit data normally |
| ATUA1  | CCR3.6   | <b>Automatic Transmit Unframed All Ones.</b> Automatically transmit an unframed all ones pattern at TTIP and TRING during a receive carrier loss (RCL) condition or a receive all ones condition.<br>0 = disabled<br>1 = enabled  |
| TAOZ   | CCR3.5   | <b>Transmit Alternate Ones and Zeros.</b> Transmit a ...101010... pattern at TTIP and TRING. The transmission of this data pattern is always timed off of TCLK (See <a href="#">Figure 1-1</a> ).<br>0 = disabled<br>1 = enabled  |
| TPRBSE | CCR3.4   | <b>Transmit PRBS Enable.</b> Transmit a $2^{15} - 1$ (E1) or a $2^{20} - 1$ (T1) PRBS at TTIP and TRING. See <a href="#">Figure 1-3</a> .<br>0 = disabled<br>1 = enabled  |
| TLCE   | CCR3.3   | <b>Transmit Loop Code Enable.</b> Enables the transmit side to transmit the loop up code in the Transmit Code Definition registers (TCD1 and TCD2). See Section <a href="#">4</a> and <a href="#">Figure 1-3</a> for details.<br>0 = disabled<br>1 = enabled  |
| LIRST  | CCR3.2   | <b>Line Interface Reset.</b> Setting this bit from a zero to a one will initiate an internal reset that resets the clock recovery state machine and re-centers the jitter attenuator. Normally this bit is only toggled on power-up. Must be cleared and set again for a subsequent reset.  |
| IBPV   | CCR3.1   | <b>Insert BPV.</b> A 0 to 1 transition on this bit will cause a single Bipolar Violation (BPV) to be inserted into the transmit data stream. Once this bit has been toggled from a 0 to a 1, the device waits for the next occurrence of three consecutive ones to insert the BPV. This bit must be cleared and set again for a subsequent error to be inserted. See <a href="#">Figure 1-3</a> .             |
| IBE    | CCR3.0   | <b>Insert Bit Error.</b> A 0 to 1 transition on this bit will cause a single logic error to be inserted into the transmit data stream. This bit must be cleared and set again for a subsequent error to be inserted. See <a href="#">Figure 1-3</a> .   |

## 4.1 Device Power-Up and Reset

The DS2148 will reset itself upon power-up, setting all writeable registers to 00h and clearing the status and information registers. CCR3.7 (TUA1) = 0 results in the LIU transmitting unframed all ones. After the power supplies have settled following power-up, initialize all control registers to the desired settings, then toggle the LIRST bit (CCR3.2). The DS2148 can be reset at anytime to the default settings by bringing  $\overline{\text{HRST}}$  (pin 29) low (level triggered) or by powering down and powering up again.

### CCR4 (03H): COMMON CONTROL REGISTER 4

|-------|-----|-------|-----|-------|-------|-------|-------|
| LLB   | RLB | ARLBE | ALB | RJAB  | ECRS2 | ECRS1 | ECRS0 |

| SYMBOL | POSITION | DESCRIPTION  |
|--------|----------|--|
| LLB    | CCR6.7   | <p><b>Local Loopback.</b> In Local Loopback (LLB), transmit data will be looped back to the receive path passing through the jitter attenuator if it is enabled. Data in the transmit path will act as normal. See <a href="#">Figure 1-1</a> and Section <a href="#">6.2.2</a> for details.</p> <p>0 = loopback disabled<br/>1 = loopback enabled</p>   |
| RLB    | CCR6.6   | <p><b>Remote Loopback.</b> In Remote Loopback (RLB), data output from the clock/data recovery circuitry will be looped back to the transmit path passing through the jitter attenuator if it is enabled. Data in the receive path will act as normal while data presented at TPOS and TNEG will be ignored. See <a href="#">Figure 1-1</a> and Section <a href="#">6.2.1</a> for details.</p> <p>0 = loopback disabled<br/>1 = loopback enabled</p>  |
| ARLBE  | CCR6.5   | <p><b>Automatic Remote Loopback Enable and Reset.</b> When this bit is set high, the device will automatically go into remote loopback when it detects loop-up code programmed into the receive loop-up code definition registers (RUPCD1 and RUPCD2) for a minimum of 5 seconds and it will also set the RIR2.1 status bit. Once in a RLB state, it will remain in this state until it has detected the loop code programmed into the receive loop-down code definition registers (RDNCD1 and RDNCD2) for a minimum of 5 seconds at which point it will force the device out of RLB and clear RIR2.1. Toggling this bit from a 1 to a 0 can reset the automatic RLB circuitry. The action of the automatic remote loopback circuitry is logically ORed with the RLB (CCR6.6) control bit (i.e., either one can cause a RLB to occur).</p> |
| ALB    | CCR6.4   | <p><b>Analog Loopback.</b> In analog loopback (ALB), signals at TTIP and TRING will be internally connected to RTIP and RRING. The incoming signals, from the line, at RTIP and RRING will be ignored. The signals at TTIP and TRING will be transmitted as normal. See <a href="#">Figure 1-1</a> and Section <a href="#">6.2.3</a> for more details.</p> <p>0 = loopback disabled<br/>1 = loopback enabled</p>   |

| ECRS0  | CCR6.0   | <b>Error Count Register Select 0.</b> See Section <a href="#">6.4</a> for details.  |

## 5 STATUS REGISTERS

There are three registers that contain information on the current real-time status of the device, status register (SR), and receive information registers 1 and 2 (RIR1/RIR2). When a particular event has occurred (or is occurring), the appropriate bit in one of these three registers will be set to a one. Some of the bits in SR, RIR1, and RIR2 are latched bits and some are real-time bits. The register descriptions below list which status bits are latched and which are real-time bits. For latched status bits, when an event or an alarm occurs the bit is set to a one and will remain set until the user reads that bit. The bit will be cleared when it is read and it will not be set again until the event has occurred again. Two of the latched status bits (RUA1 & RCL) will remain set after reading if the alarm is still present.

The user will always precede a read of any of the three status registers with a write. The byte written to the register will inform the DS2148 which bits the user wishes to read and have cleared. The user will write a byte to one of these registers with a one in the bit positions to be read and a zero in the other bit positions. When a one is written to a bit location, that location will be updated with the latest information. When a zero is written to a bit position, that bit position will not be updated and the previous value will be held. A write to the status and information registers will be immediately followed by a read of the same register. The read result should be logically ANDed with the mask byte that was just written and this value should be written back into the same register to ensure that bit does indeed clear. This second write step is necessary because the alarms and events in the status registers occur asynchronously with respect to their access via the parallel port. This write-read-write scheme allows an external microcontroller or microprocessor to individually poll certain bits without disturbing the other bits in the register. This operation is key in controlling the DS2148 with higher-order software languages.

The bits in the SR register have the unique ability to initiate a hardware interrupt via the  $\overline{\text{INT}}$  output pin. Each of the alarms and events in the SR can be either masked or unmasked from the interrupt pin via the interrupt mask register (IMR). The interrupts caused by the RCL, RUA1, and LOTC bits in SR act differently than the interrupts caused by the other status bits in SR. The RCL, RUA1 and LOTC bits will force the  $\overline{\text{INT}}$  pin low whenever they change state (i.e., go active or inactive). The  $\overline{\text{INT}}$  pin will be allowed to return high (if no other interrupts are present) when the user reads the alarm bit that caused the interrupt to occur even if the alarm is still present. The other status bits in SR can force the  $\overline{\text{INT}}$  pin low when they are set. The  $\overline{\text{INT}}$  pin will be allowed to return high (if no other interrupts are present) when the user reads the event bit that caused the interrupt to occur.

**Table 5-1. Received Alarm Criteria**

| ALARM            | E1/T1 | SET CRITERIA  | CLEAR CRITERIA  |
|------------------|-------|---|---|
| RUA1             | E1    | Less than two zeros in two frames (512 bits)                  | More than two zeros in two frames (512 bits)  |
| RUA1             | T1    | Over a 3ms window, five or less zeros are received            | Over a 3ms window, six or more zeros are received   |
| RCL <sup>1</sup> | E1    | 255 (or 2048) <sup>2</sup> consecutive zeros received (G.775) | In 255 bit times, at least 32 ones are received   |
| RCL <sup>1</sup> | T1    | 192 (or 1544) <sup>2</sup> consecutive zeros are received     | 14 or more ones out of 112 possible bit positions are received starting with the first one received |

**NOTES:**

- 1) Receive carrier loss (RCL) is also known as loss-of-signal (LOS) or Red Alarm in T1.
- 2) See CCR1.5 for details.

**SR (06H): STATUS REGISTER**

| (MSB) |     |     |      |     |      |      | (LSB) |
|-------|-----|-----|------|-----|------|------|-------|

## 6 DIAGNOSTICS

### 6.1 In-Band Loop Code Generation and Detection

The DS2148 can generate and detect a repeating bit pattern that is from one to eight or sixteen bits in length. To transmit a pattern, the user will load the pattern to be sent into the Transmit Code Definition (TCD1 and TCD2) registers and select the proper length of the pattern by setting the TC0 and TC1 bits in the In-Band Code Control (IBCC) register. When generating a 1, 2, 4, 8, or 16 bit pattern both the transmit code registers (TCD1 and TCD2) must be filled with the proper code. Generation of a 1, 3, 5, or 7-bit pattern only requires TCD1 to be filled. Once this is accomplished, the pattern will be transmitted as long as the TLCE control bit (CCR3.3) is enabled. As an example, if the user wished to transmit the standard “loop up” code for Channel Service Units which is a repeating pattern of ...10000100001... then 80h would be loaded into TCD1 and the length would set using TC1 and TC0 in the IBCC register to 5 bits.

The DS2148 can detect two separate repeating patterns to allow for both a loop-up code and a loop-down code to be detected. The user will program the codes to be detected in the Receive Up Code Definition (RUPCD1 and RUPCD2) registers and the Receive Down Code Definition (RDNCD1 and RDNCD2) registers and the length of each pattern will be selected via the IBCC register. The DS2148 will detect repeating pattern codes with bit error rates as high as  $1 \times 10^{-2}$ . The code detector has a nominal integration period of 48ms, hence, after about 48ms of receiving either code, the proper status bit (LUP at SR.7 and LDN at SR.6) will be set to a one. Normally codes are sent for a period of 5 seconds. It is recommended that the software poll the DS2148 every 100ms to 1000ms until 5 seconds has elapsed to ensure that the code is continuously present.

### IBCC (0AH): IN-BAND CODE CONTROL REGISTER

## 6.2 Loopbacks

### 6.2.1 Remote Loopback (RLB)

When RLB (CCR6.6) is enabled, the DS2148 is placed into remote loopback. In this loopback, data from the clock/data recovery state machine will be looped back to the transmit path passing through the jitter attenuator if it is enabled. The data at the RPOS and RNEG pins will be valid while data presented at TPOS and TNEG will be ignored ([Figure 1-1](#)).

If the Automatic Remote Loopback Enable (CCR6.5) is set to a one, the DS2148 will automatically go into remote loopback when it detects the loop up code programmed in the Receive Up Code Definition Registers (RUPCD1 and RUPCD2) for a minimum of 5 seconds. When the DS2148 detects the loop down code programmed in the Receive Loop Down Code Definition registers (RDNCD1 and RDNCD2) for a minimum of 5 seconds, the DS2148 will come out of remote loopback. Setting ARLBE to a zero also can disable the ARLB.

### 6.2.2 Local Loopback (LLB)

When LLB (CCR6.7) is set to a one, the DS2148 is placed into local loopback. In this loopback, data on the transmit-side will continue to be transmitted as normal. TCLK and TPOS/TNEG will pass through the jitter attenuator (if enabled) and be output at RCLK and RPOS/RNEG. Incoming data from the line at RTIP and RRING will be ignored. If Transmit Unframed All Ones (CCR3.7) is set to a one while in LLB, TTIP and TRING will transmit all ones while TCLK and TPOS/TNEG will be looped back to RCLK and RPOS/RNEG ([Figure 1-1](#)).

### 6.2.3 Analog Loopback (ALB)

Setting ALB (CCR6.4) to a one puts the DS2148 in Analog Loopback. Signals at TTIP and TRING will be internally connected to RTIP and RRING. The incoming signals at RTIP and RRING will be ignored. The signals at TTIP and TRING will be transmitted as normal. (See [Figure 1-1](#).)

### 6.2.4 Dual Loopback (DLB)

Setting both CCR6.7 and CCR6.6 to a one, LLB and RLB respectively, puts the DS2148 into dual loopback operation. The TCLK and TPOS/TNEG signals will be looped back through the jitter attenuator (if enabled) and output at RCLK and RPOS/RNEG. Clock and data recovered from RTIP and RRING will be looped back to the transmit-side and output at TTIP and TRING. This mode of operation is not available when implementing hardware operation. (See [Figure 1-1](#).)

## 6.3 PRBS Generation and Detection

Setting TPRBSE (CCR3.4) = 1 enables the DS2148 to transmit a  $2^{15}-1$  (E1) or a  $2^{20}-1$  (T1) Pseudo Random Bit Sequence (PRBS) depending on the ETS bit setting in CCR1.7. The receive-side of the DS2148 will always search for these PRBS patterns independent of CCR3.4. The PRBS Bit Error Output (PBEO) will remain high until the receiver has synchronized to one of the two patterns (64 bits received without an error) at which time PBEO will go low and the PRBSD bit in the status register (SR) will be set. Once synchronized, any bit errors received will cause a positive going pulse at PBEO, synchronous with RCLK. This output can be used with external circuitry to keep track of bit error rates during the PRBS testing. Setting CCR6.0 (ECRS) = 1 will allow the PRBS errors to be accumulated in the 16-bit counter in registers ECR1 and ECR2. The PRBS synchronizer will remain in sync until it experiences 6 bit errors or more within a 64-bit span. Both PRBS patterns comply with the ITU-T O.151 specifications.

## 6.4 Error Counter

Error Count Register 1 (ECR1) is the most significant word and ECR2 is the least significant word of a user-selectable 16-bit counter that records incoming errors including Bipolar Violations (BPV), Code Violations (CV), Excessive Zero violations (EXZ) and/or PRBS Errors. See [Table 6-3](#) and [Table 6-4](#) and [Figure 1-2](#) for details.

**Table 6-3. Definition of Received Errors**

| ERROR | E1 OR T1 | DEFINITION OF RECEIVED ERRORS  |
|-------|----------|--|
| BPV   | E1/T1    | Two consecutive marks with the same polarity. Will ignore BPVs due to HDB3 and B8ZS zero suppression when CCR2.3 = 0. Typically used with AMI coding (CCR2.3 = 1). ITU-T O.161.                                      |
| CV    | E1       | When HDB3 is enabled (CCR2.3 = 0) and the receiver detects two consecutive BPVs with the same polarity. ITU-T O.161.   |
| EXZ   | E1       | When four or more consecutive zeros are detected.  |
| EXZ   | T1       | When receiving AMI coded signals (CCR2.3 = 1), detection of 16 or more zeros or a BPV. ANSI T1.403 1999.<br>When receiving B8ZS coded signals (CCR2.3 = 0), detection of 8 or more zeros or a BPV. ANSI T1.403 1999. |
| PRBS  | E1/T1    | A bit error in a received PRBS pattern. See Section <a href="#">6.3</a> for details. ITU-T O.151.  |

**Table 6-4. Function of ECRS Bits and RNEG Pin**

| E1 or T1<br>(CCR1.7) | ECRS2<br>(CCR6.2) | ECRS1<br>(CCR6.1) | ECRS0<br>(CCR6.0) | RHBE<br>(CCR2.3) | FUNCTION OF ECR<br>COUNTERS/RNEG <sup>1</sup> |
|----------------------|-------------------|-------------------|-------------------|------------------|---|
| 0                    | 0                 | 0                 | 0                 | X                | CVs   |
| 0                    | 0                 | 0                 | 1                 | X                | BPVs (HDB3 codewords not counted)             |
| 0                    | 0                 | 1                 | 0                 | X                | CVs + EXZs                                    |
| 0                    | 0                 | 1                 | 1                 | X                | BPVs + EXZs                                   |
| 1                    | 0                 | X                 | 0                 | 0                | BPVs (B8ZS codewords not counted)             |
| 1                    | 0                 | X                 | 1                 | 0                | BPVs + 8 EXZs                                 |
| 1                    | 0                 | X                 | 0                 | 1                | BPVs  |
| 1                    | 0                 | X                 | 1                 | 1                | BPVs + 16 EXZs                                |
| X                    | 1                 | X                 | X                 | X                | PRBS Errors <sup>2</sup>                      |

**NOTES:**

- 1) RNEG outputs error data only when in NRZ mode (CCR1.6 = 1).
- 2) PRBS errors will always be output at PBEO independent of ECR control bits and NRZ mode and will not be present at RNEG.

**6.4.1 Error Counter Update**

A transition of the ECUE (CCR1.4) control bit from 0 to 1 will update the ECR registers with the current values and reset the counters. ECUE must be set back to zero and another 0 to 1 transition must occur for subsequent reads/resets of the ECR registers. Note that the DS2148 can report errors at RNEG when in NRZ mode (CCR1.6 = 1) by outputting a pulse for each error occurrence. The counter saturates at 65,535 and will not rollover.

ECR1.7

**MSB of the 16-bit error count.**

E0

ECR2.0

**LSB of the 16-bit error count.****6.5 Error Insertion**

When IBPV (CCR3.1) is transitioned from a zero to a one, the device waits for the next occurrence of three consecutive ones to insert a BPV. IBPV must be cleared and set again for another BPV error insertion. See [Figure 1-3](#) for details on the insertion of the BPV into the datastream.

When IBE (CCR3.0) is transitioned from a zero to a one, the device will insert a logic error. IBE must be cleared and set again for another logic error insertion. See [Figure 1-3](#) for details on the insertion of the logic error into the datastream.

## 7 ANALOG INTERFACE

### 7.1 Receiver

The DS2148 contains a digital clock recovery system. The DS2148 couples to the receive E1 or T1 twisted pair (or coaxial cable in 75Ω E1 applications) via a 1:1 transformer. See [Table 7-3](#) or transformer details. [Figure 7-1](#), [Figure 7-2](#), and [Figure 7-3](#) along with [Table 7-1](#) and [Table 7-2](#) show the receive termination requirements. The DS2148 has the option of using internal termination resistors.

The DS2148 is designed to be fully software-selectable for E1 and T1 without the need to change any external resistors for the receive-side. The receive-side will allow the user to configure the DS2148 for 75Ω, 100Ω, or 120Ω receive termination by setting the RT1 (CCR5.1) and RT0 (CCR5.0) bits. When using the internal termination feature, the Rr resistors should be 60Ω each ([Figure 7-1](#)). If external termination is required, RT1 and RT0 should be set to 0 and both Rr resistors in [Figure 7-1](#) will need to be 37.5Ω, 50Ω, or 60Ω each depending on the line impedance.

The resultant E1 or T1 clock derived from the 2.048/1.544 PLL (JACLK in [Figure 1-1](#)) is internally multiplied by 16 via another internal PLL and fed to the clock recovery system. The clock recovery system uses the clock from the PLL circuit to form a 16 times oversampler, which is used to recover the clock and data. This oversampling technique offers outstanding performance to meet jitter tolerance specifications shown in [Figure 7-6](#).

Normally, the clock that is output at the RCLK pin is the recovered clock from the E1 AMI/HDB3 or T1 AMI/B8ZS waveform presented at the RTIP and RRING inputs. When no signal is present at RTIP and RRING, a Receive Carrier Loss (RCL) condition will occur and the RCLK will be derived from the JACLK source ([Figure 1-1](#)). If the jitter attenuator is placed in the receive path (as is the case in most applications), the jitter attenuator restores the RCLK to an approximate 50% duty cycle. If the jitter attenuator is either placed in the transmit path or is disabled, the RCLK output can exhibit slightly shorter high cycles of the clock. This is due to the highly oversampled digital clock recovery circuitry. See the Receive AC Timing Characteristics in Section [10](#) for more details.

The receive-side circuitry also contains a clock synthesizer, which outputs a user configurable clock (up to 16.384MHz) synthesized to RCLK at BPCLK (pin 31). See [Table 4-3](#) for details on output clock frequencies at BPCLK. In hardware mode, BPCLK defaults to a 16.384MHz output.

The DS2148 has a bypass mode for the receive side clock and data. This allows the BPCLK to be derived from RCLK after the jitter attenuator while the clock and data presented at RCLK, RPOS, and RNEG go unaltered. This is intended for applications where the receive side jitter attenuation will be done after the LIU. Setting RJAB (CCR6.3) to a logic 1 will enable the bypass. Be sure that the jitter attenuator is in the receive path (CCR4.3 = 0). See [Figure 1-1](#) for details.

The DS2148 will report the signal strength at RTIP and RRING in 2.5dB increments via RL3-RL0 located in the Receive Information Register 2. This feature is helpful when trouble shooting line performance problems. See [Table 5-2](#) for details.

Monitor applications in both E1 and T1 require various flat gain settings for the receive-side circuitry. The DS2148 can be programmed to support these applications via the Monitor Mode control bits MM1 and MM0. When the monitor modes are enabled, the receiver will tolerate normal line loss up to -6dB. See [Table 4-4](#) for details.

## 7.2 Transmitter

The DS2148 uses a set of laser-trimmed delay lines along with a precision digital-to-analog converter (DAC) to create the waveforms that are transmitted onto the E1 or T1 line. The waveforms created by the DS2148 meet the latest ETSI, ITU, ANSI, and AT&T specifications. The user will select which waveform is to be generated by setting the ETS bit (CCR1.7) for E1 or T1 operation, then programming the L2/L1/L0 bits in Common Control Register 4 for the appropriate application. See [Table 7-1](#) and [Table 7-2](#) for the proper L2/L1/L0 settings.

A 2.048MHz or 1.544MHz TTL clock is required at TCLK for transmitting data at TPOS and TNEG. ITU specification G.703 requires an accuracy of  $\pm 50$ ppm for both T1 and E1. TR62411 and ANSI specs require an accuracy of  $\pm 32$ ppm for T1 interfaces. The clock can be sourced internally by RCLK or JACLK. See CCR1.2, CCR1.1, CCR1.0, and [Figure 1-3](#) for details. Because of the nature of the DS2148 transmitter design, very little jitter (less than  $0.005U_{I_{P-P}}$  broadband from 10Hz to 100kHz) is added to the jitter present on TCLK. Also, the waveforms created are independent of the duty cycle of TCLK. The transmitter in the DS2148 couples to the E1 or T1 transmit twisted pair (or coaxial cable in some E1 applications) via a 1:1.36 step-up transformer. In order for the device to create the proper waveforms, the transformer used must meet the specifications listed in [Table 7-3](#).

The DS2148 has automatic short-circuit limiter that limits the source current to 50mA (RMS) into a 1 $\Omega$  load. This feature can be disabled by setting the SCLD bit (CCR2.5) = 1. When the current limiter is activated, TCLE (SR.2) will be set even if short circuit limiter is disabled. The TPD bit (CCR4.0) will power-down the transmit line driver and tri-state the TTIP and TRING pins. The DS2148 also can detect when the TTIP or TRING outputs are open-circuited. When an open circuit is detected, TOCD (SR.1) will be set.

## 7.3 Jitter Attenuator

The DS2148 contains an on-board jitter attenuator that can be set to a depth of either 32 bits or 128 bits via the JABDS bit (CCR4.2). In hardware mode the depth is 128 bits and cannot be changed. The 128-bit mode is used in applications where large excursions of wander are expected. The 32-bit mode is used in delay sensitive applications. The characteristics of the attenuation are shown in [Figure 7-7](#). The jitter attenuator can be placed in either the receive path or the transmit path by appropriately setting or clearing the JAS bit (CCR4.3). Also, the jitter attenuator can be disabled (in effect, removed) by setting the DJA bit (CCR4.1). In order for the jitter attenuator to operate properly, a 2.048MHz or 1.544MHz clock must be applied at MCLK. ITU specification G.703 requires an accuracy of  $\pm 50$ ppm for both T1 and E1. TR62411 and ANSI specs require an accuracy of  $\pm 32$ ppm for T1 interfaces. There is an onboard PLL for the jitter attenuator, which will convert the 2.048MHz clock to a 1.544MHz rate for T1 applications. Setting JAMUX (CCR1.3) to a logic 0 bypasses this PLL. On-board circuitry adjusts either the recovered clock from the clock/data recovery block or the clock applied at the TCLK pin to create a smooth jitter-free clock that is used to clock data out of the jitter attenuator FIFO. It is acceptable to provide a gapped/bursty clock at the TCLK pin if the jitter attenuator is placed on the transmit side. If the incoming jitter exceeds either  $120U_{I_{P-P}}$  (buffer depth is 128 bits) or  $28U_{I_{P-P}}$  (buffer depth is 32 bits), then the DS2148 will divide the internal nominal 32.768MHz (E1) or 24.704MHz (T1) clock by either 15 or 17 instead of the normal 16 to keep the buffer from overflowing. When the device divides by either 15 or 17, it also sets the jitter attenuator limit trip (JALT) bit in the receive information register 1 (RIR1).

## 7.4 G.703 Synchronization Signal

The DS2148 is capable of receiving a 2.048MHz square-wave synchronization clock as specified in Section 13 of ITU G.703 (10/98). To use the DS2148 in this mode, set the receive synchronization clock enable (CCR5.3) = 1. The DS2148 can also transmit the 2.048MHz square-wave synchronization clock as specified in Section 10 of G.703. To transmit the 2.048MHz clock, set the transmit synchronization clock enable (CCR5.2) = 1.

**Table 7-1. Line Build-Out Select for E1 in Register CCR4 (ETS = 0)**

| L2 | L1 | L0 | V <sub>DD</sub> | APPLICATION              | N      | RETURN LOSS | R <sub>t</sub> |
|----|----|----|-----------------|--------------------------|--------|-------------|----------------|

N.M. = Not meaningful

Note: See [Figure 7-1](#), [Figure 7-2](#), and [Figure 7-3](#).

**Table 7-3. Transformer Specifications for 5V Operation**

| SPECIFICATION  | RECOMMENDED VALUE                     |
|--|---------------------------------------|
| Turns Ratio 5V Applications  | 1:1(receive) and 1:1.36(transmit) ±2% |
| Primary Inductance   | 600μH minimum                         |
| Leakage Inductance   | 1.0μH maximum                         |
| Interwinding Capacitance   | 40pF maximum                          |
| Transmit Transformer DC Resistance<br>Primary (Device Side)<br>Secondary | 1.2Ω maximum<br>1.2Ω maximum          |
| Receive Transformer DC Resistance<br>Primary (Device Side)<br>Secondary  | 1.2Ω maximum<br>1.2Ω maximum          |

**Figure 7-1. Basic Interface**

**Figure 7-2. Protected Interface Using Internal Receive Termination****NOTES:**

- 1) All resistor values are  $\pm 1\%$ .
- 2)  $C1 = C2 = 0.1\mu\text{F}$ .
- 3) S is a 6V transient suppresser.
- 4) D1 to D8 are Schottky diodes.
- 5) The fuses are optional to prevent AC power line crosses from compromising the transformers.
- 6)  $R_p$  resistors exist to keep the Fuses from opening during a surge. If they are used, then the  $60\Omega$  receive termination resistance must be adjusted to match the line impedance.
- 7) The  $R_t$  resistors are used to increase the transmitter return loss (Table 7-1). No return loss is required for T1 applications.
- 8) The transmit transformer turns ratio (N) would be 1:1.36 for 5V operation.
- 9) The  $68\mu\text{F}$  is used to keep the local power plane potential within tolerance during a surge.

**Figure 7-3. Protected Interface Using External Receive Termination****NOTES:**

- 1) All resistor values are  $\pm 1\%$ .
- 2)  $C1 = 0.1\mu\text{F}$ .
- 3) S is a 6V transient suppresser.
- 4) D1 to D4 are Schottky diodes.
- 5) The fuses are optional to prevent AC power line crosses from compromising the transformers.
- 6)  $R_p$  resistors exist to keep the Fuses from opening during a surge. If they are used, then  $R_r$  must be adjusted to match the line impedance.
- 7)  $R_r = 37.5\Omega$  for  $75\Omega$ ,  $60\Omega$  for  $120\Omega$  E1 systems, or  $50\Omega$  for  $100\Omega$  T1 lines.
- 8) The  $R_t$  resistors are used to increase the transmitter return loss (Table 7-1). No return loss is required for T1 applications.
- 9) The transmit transformer turns ratio (N) would be 1:1.36 for 5V operation.
- 10) The  $68\mu\text{F}$  is used to keep the local power plane potential within tolerance during a surge.

## 8 DS21Q48 QUAD LIU

The DS21Q48 is a quad version of the DS2148G utilizing CSBGA on carrier packaging technology. The four LIUs are controlled via the parallel port mode. Serial and hardware modes are unavailable in this package.

**Table 8-1. DS21Q48 Pin Assignment**

| DS21Q48<br>PIN# | I/O | PARALLEL PORT<br>MODE |

**NOTES:**

- 1) Shaded areas are signals common to all four devices.
- 2) Connect to V<sub>SS</sub>.

## 9 DC CHARACTERISTICS

### ABSOLUTE MAXIMUM RATINGS\*

|  |                                       |
|--|---------------------------------------|
| Voltage Range on Any Pin Relative to Ground..... | -1.0V to +6.0V                        |
| Operating Temperature Range for DS2148TN.....    | -40°C to +85°C                        |
| Storage Temperature Range.....                   | -55°C to +125°C                       |
| Soldering Temperature.....                       | See IPC/JEDEC J-STD-020 Specification |

\* This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time can affect device reliability.

**Table 9-1. Recommended DC Operating Conditions**

(T<sub>A</sub> = -40°C to +85°C)

| PARAMETER               | SYMBOL          | MIN  | TYP | MAX  | UNITS | NOTES |
|-------------------------|-----------------|------|-----|------|-------|-------|
| Logic 1                 | V <sub>IH</sub> | 2.0  |     | 5.5  | V     |       |
| Logic 0                 | V <sub>IL</sub> | -0.3 |     | +0.8 | V     |       |
| Supply for 5V Operation | V <sub>DD</sub> | 4.75 | 5   | 5.25 | V     | 1     |

**Table 9-2. Capacitance**

(T<sub>A</sub> = +25°C)

| PARAMETER          | SYMBOL           | MIN | TYP | MAX | UNITS | NOTES |
|--------------------|------------------|-----|-----|-----|-------|-------|
| Input Capacitance  | C <sub>IN</sub>  |     | 5   |     | pF    |       |
| Output Capacitance | C <sub>OUT</sub> |     | 7   |     | pF    |       |

**Table 9-3. DC Characteristics**

(V<sub>DD</sub> = 5.0V ±5%, T<sub>A</sub> = -40°C to +85°C.)

| PARAMETER             | SYMBOL          | MIN  | TYP | MAX  | UNITS | NOTES |
|-----------------------|-----------------|------|-----|------|-------|-------|
| Input Leakage         | I <sub>IL</sub> | -1.0 |     | +1.0 | μA    | 3     |
| Output Leakage        | I <sub>LO</sub> |      |     | 1.0  | μA    | 4     |
| Output Current (2.4V) | I <sub>OH</sub> | -1.0 |     |      | mA    |       |
| Output Current (0.4V) | I <sub>OL</sub> | +4.0 |     |      | mA    |       |
| Supply Current        | I <sub>DD</sub> | -    | 95  | 125  | mA    | 2, 5  |

### NOTES:

- 1) Applies to V<sub>DD</sub>.
- 2) TCLK = MCLK = 2.048MHz.
- 3) 0.0V < V<sub>IN</sub> < V<sub>DD</sub>.
- 4) Applied to  $\overline{\text{INT}}$  when tri-stated.
- 5) Power dissipation with TTIP and TRING driving a 30Ω load, for an all-ones data density.

## 9.1 THERMAL CHARACTERISTICS

**Table 9-4. Thermal Characteristics—DS21Q48 CSBGA Package**

| PARAMETER                               | MIN   | TYP      | MAX    | NOTES |
|---|-------|----------|--------|-------|
| Ambient Temperature                     | -40°C | -        | +85°C  | 1     |
| Junction Temperature                    | -     | -        | +125°C |       |
| Theta-JA ( $\theta_{JA}$ ) in Still Air | -     | +24°C/W  | -      | 2     |
| Theta-JC ( $\theta_{JC}$ ) in Still Air | -     | +4.1°C/W | -      | 3     |

### NOTES:

- 1) The package is mounted on a four-layer JEDEC-standard test board.
- 2) Theta-JA ( $\theta_{JA}$ ) is the junction to ambient thermal resistance, when the package is mounted on a four-layer JEDEC-standard test board.
- 3) While Theta-JC ( $\theta_{JC}$ ) is commonly used as the thermal parameter that provides a correlation between the junction temperature ( $T_j$ ) and the average temperature on top center of four of the chip-scale BGA packages ( $T_C$ ), the proper term is Psi-JT. It is defined by:

$$(T_j - T_C) / \text{overall package power}$$

The method of measurement of the thermal parameters is defined in EIA/JEDEC-standard document EIA-JESD51-2.

**Table 9-5. Theta-JA ( $\theta_{JA}$ ) vs. Airflow**

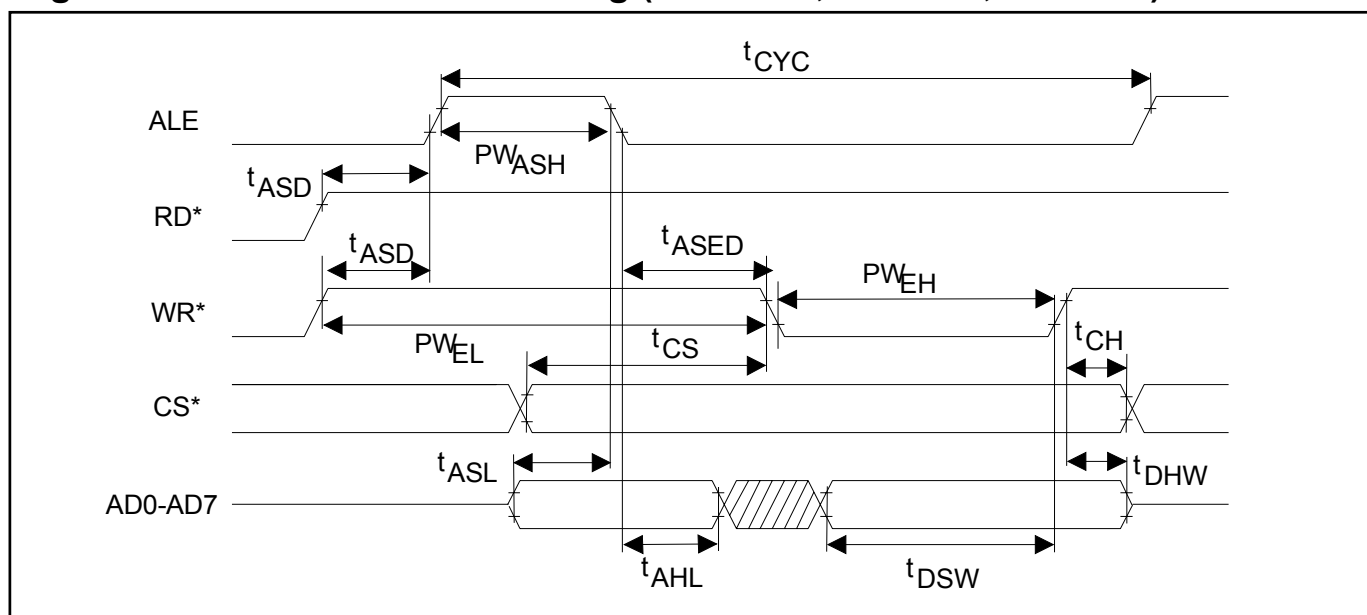

| FORCED AIR (m/s) | THETA-JA ( $\theta_{JA}$ ) |
|------------------|----------------------------|
| 0                | 24°C/W                     |
| 1                | 21°C/W                     |
| 2.5              | 19°C/W                     |

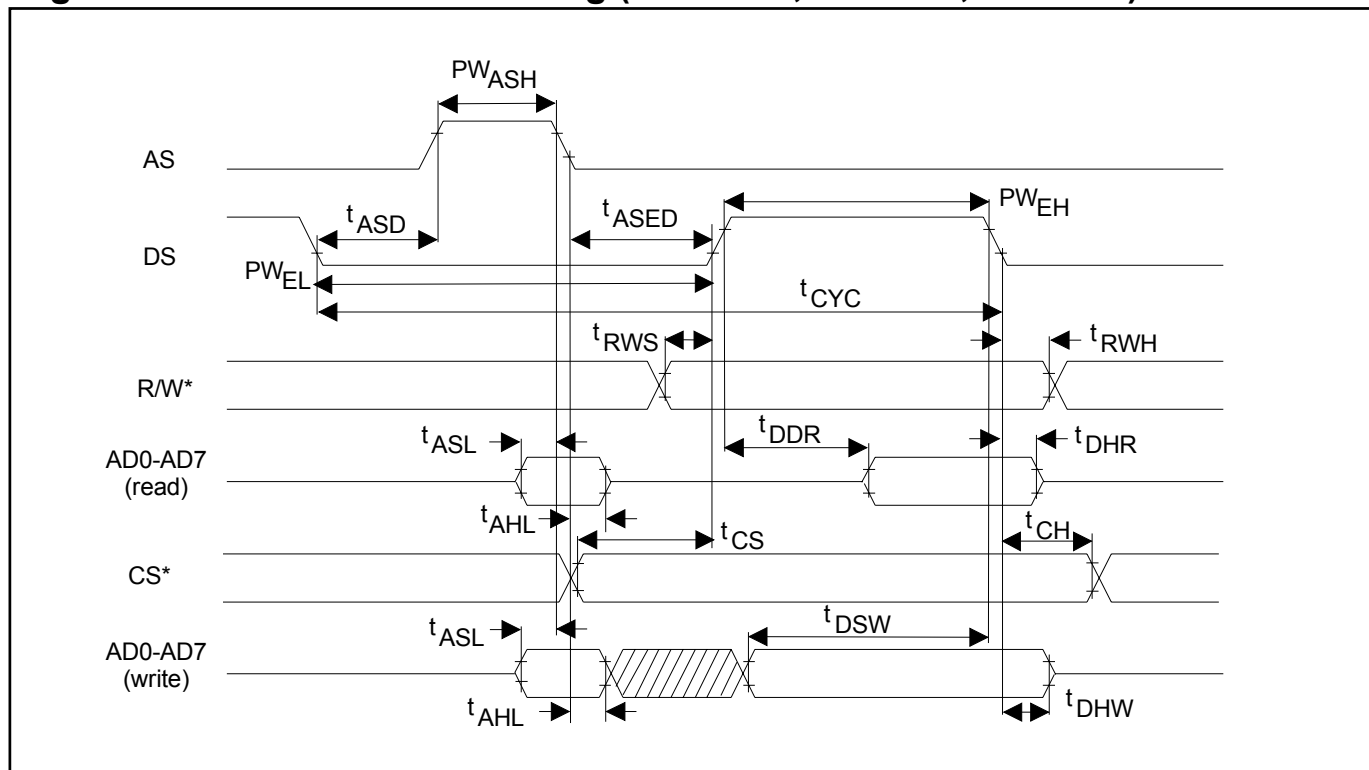

## 10 AC CHARACTERISTICS

**Table 10-1. AC Characteristics—Multiplexed Parallel Port  
(BIS1 = 0, BIS0 = 0)**

( $V_{DD} = 5.0V \pm 5\%$ ,  $T_A = -40^\circ C$  to  $+85^\circ C$ .) (See [Figure 10-1](#), [Figure 10-2](#), and [Figure 10-3](#).)

| PARAMETER   | SYMBOL     | MIN | TYP | MAX | UNITS | NOTES |
|---|------------|-----|-----|-----|-------|-------|
| Cycle Time  | $t_{CYC}$  | 200 |     |     | ns    |       |
| Pulse Width, DS Low or $\overline{RD}$ High                                     | $PW_{EL}$  | 100 |     |     | ns    |       |
| Pulse Width, DS High or $\overline{RD}$ Low                                     | $PW_{EH}$  | 100 |     |     | ns    |       |

## 11 PACKAGE INFORMATION

(The package drawing(s) in this data sheet may not reflect the most current specifications. The package number provided for each package is a link to the latest package outline information.)

### 11.1 44-Pin TQFP ([56-G4012-001](#))

#### NOTES:

1. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH, BUT DO NOT INCLUDE MOLD PROTRUSION; ALLOWABLE PROTRUSION IS 0.25 MM PER SIDE.
2. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
3. ALLOWABLE DAMBAR PROTRUSION IS 0.08 MM TOTAL IN EXCESS OF THE B DIMENSION; AT MAXIMUM MATERIAL CONDITION. PROTRUSION NOT TO BE LOCATED ON LOWER RADIUS OR FOOT OF LEAD.
4. CONTROLLING DIMENSIONS: MILLIMETERS.

| DIM | MIN   | MAX   |
|-----|-------|-------|
| A   | —     | 1.20  |
| A1  | 0.05  | 0.15  |
| A2  | 0.95  | 1.05  |
| D   | 11.80 | 12.20 |
| D1  | 10.00 | BSC   |
| E   | 11.80 | 12.20 |
| E1  | 10.00 | BSC   |
| L   | 0.45  | 0.75  |
| e   | 0.80  | BSC   |
| B   | 0.30  | 0.45  |
| C   | 0.09  | 0.20  |
