

NCS5000

Integrated RF Schottky Detector

The NCS5000 is an integrated Schottky detector intended for use as a level detector in RF measurement/power control applications such as those found in GSM handsets. The detector converts the peak RF voltage applied to a DC level. The circuit consists of an RF Schottky detector, a reference Schottky diode, as well as biasing and control circuitry. There is an enable input that allows the part to be placed in a low power state when not in use.

The detector is designed for operation up to 2.0 GHz and can operate with input power levels up to +25 dBm. There is a fixed offset of 10 mV (nominal) between the Reference Detector and the RF Detector under no applied RF. The two detectors are monolithically integrated so that they closely track overtemperature, voltage and process.

The NCS5000 is housed in a very small TSOP-6 package ideal for portable applications. The TSOP-6 package is a lower profile, footprint compatible package to the SOT23-6.

PIN DESCRIPTION

Pin	Name	Description
1	DET_OUT	This is the RF Detector Output. This signal is proportional to the peak RF voltage applied at the RF_In pin.
2	V _{CC}	Input power supply.
3	Enable	Control signal to turn on and off the device. If this signal is not used, this pin should be connected directly to V _{CC} . A logic high on this input turns on the device.
4	RF_In	This is the input to the RF detector. The signal must be AC-coupled into this input with a good quality RF capacitor.
5	GND	Ground.
6	REF	This is the reference detector output. Nominal this signal is 10 mV higher than DET_OUT when no RF signal is applied at RF_In.

APPLICATION INFORMATION

The NCS5000 is an integrated RF Schottky detector designed for use in level detector and power amplifier control circuits. The device is optimized for large signal applications ($P_{in} > -20$ dBm) such as those found in GSM handsets and data modems. This device has been designed for applications that require operation from a single Li-Ion or multi- Ni-MH battery pack. The operating range is 2.7 V – 5.5 V so the device can be powered directly from the battery or a low drop out regulator. To support power sequencing, an Enable circuitry is included which allows the device to be placed into a very low power state ($< 3.0 \mu\text{W}$) when not in use.

In addition to the RF detector, a reference detector is included so the NCS5000 can be used to implement a differential detector. Since the RF and reference detectors are integrated on the same silicon, they track each other tightly over temperature, bias voltage, and process. Each detector is biased with approximately 45 μA of current and there is a built-in offset of 10 mV (nom) between the RF and the Reference Detector.
