ASPM 27 Series

3-Phase 650 V, 30 A Automotive Smart Power Module

General Description

NFVA33065L32 is an advanced Automotive SPM® module providing a fully-featured, high-performance inverter output stage for hybrid and electric vehicles. These modules integrate optimized gate drive of the built-in IGBTs to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockouts, over-current shutdown, thermal monitoring of drive IC, and fault reporting. The built-in, high-speed HVIC requires only a single supply voltage and translates the incoming logic-level gate inputs to the high-voltage, high-current drive signals required to properly drive the module's internal IGBTs. Separate negative IGBT terminals are available for each phase to support the widest variety of control algorithms.

Features

- Automotive SPM in 27 pin DIP package
- AEC & AQG324 Qualified and PPAP Capable
- 650 V/30 A 3-Phase IGBT Inverter with Integral Gate Drivers and Protections
- 175°C guaranteed Short-Circuit Rated FS Trench IGBTs with stable EMI performance
- Outstanding Thermal Resistance using Al2O3 DBC Substrate
- Separated Open-Emitter Pins from Low-Side IGBTs for Three-Phase Current Sensing
- Single-Grounded Power Supply
- LVIC Temperature–Sensing Built–In for Temperature Monitoring
- Isolation Rating: 2500 V_{rms}/1 min.
- Pb-Free and RoHS compliant

Applications

- Automotive high voltage auxiliary motors
 - Climate e–Compressors
 - Oil/Water Pumps
 - Super/Turbo Chargers
 - Variety Fans

ORDERING INFORMATION

See detailed ordering and shipping information on page 6 of this data sheet.

Integrated Drive, Protection and System Control Functions

- For inverter high-side IGBTs: gate drive circuit, high-voltage isolated high-speed level shifting control circuit, Under-Voltage Lock-Out (UVLO) protection
- For inverter low-side IGBTs: gate drive circuit, Short-Circuit Protection (SCP) control circuit, Under-Voltage Lock-Out Protection (UVLO)
- Fault signaling: corresponding to UVLO (low-side supply) and SC faults
- Input interface: active-HIGH interface, works with 3.3/5 V logic, Schmitt-trigger input

INTERNAL EQUIVALENT CIRCUIT AND INPUT/OUTPUT PINS

NOTES:

- 1. Inverter low-side is composed of three IGBTs, freewheeling diodes for each IGBT, and one control IC. It has gate drive and protection functions.
- Inverter power side is composed of four inverter DC-link input terminals and three inverter output terminals.
 Inverter high-side is composed of three IGBTs, freewheeling diodes, and three drive ICs for each IGBT.

NOTES:

- 11. Do not make over torque when mounting screws. Much mounting torque may cause DBC cracks, as well as bolts and Al heat-sink destruction
- 12. Avoid one–sided tightening stress. Figure 8 shows the recommended torque order for mounting screws. Uneven mounting can cause the DBC substrate of package to be damaged. The pre–screwing torque is set to 20 ~ 30% of maximum torque rating.

NOTE:

13.RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The input signal section of the ASPM27 product integrates 5kΩ (typ.) pull–down resistor. Therefore, when using an external filtering resistor, please pay attention to the signal voltage drop at input terminal.

Figure 12. Recommended CPU I/O Interface Circuit

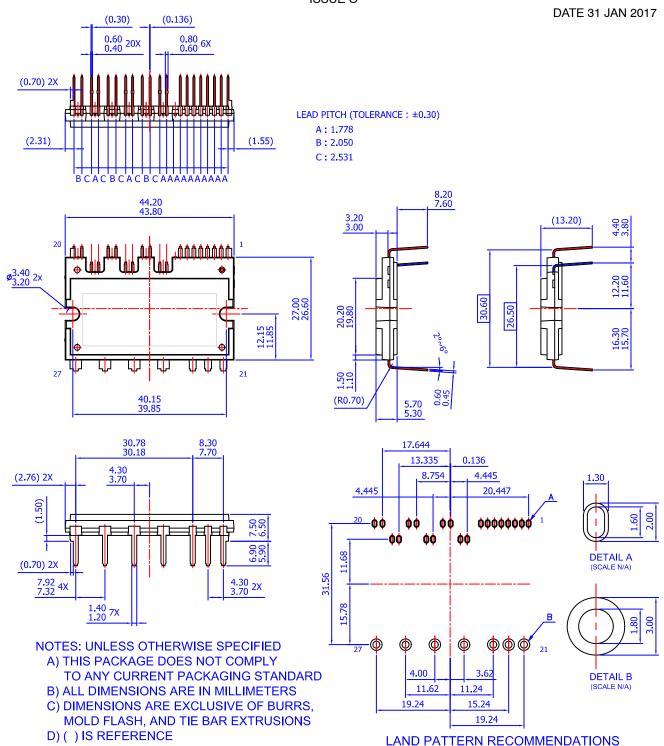

NOTES:

- 14. To avoid malfunction, the wiring of each input should be as short as possible. (less than 2-3 cm)
- 15.V_{FO} output is open-drain type. The signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes I_{FO} up to 2mA. Refer to Figure 12.
- 16. Input signal is active–HIGH type. There is a 5 k Ω resistor inside the IC to pull–down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation. R_1C_1 time constant should be selected in the range 50~150 ns. (Recommended R_1 = 100 Ω , C_1 = 1 nF)
- 17. Each wiring pattern inductance of A point should be minimized (Recommended less than 10 nH). Use the shunt resistor R₄ of surface mounted (SMD) type to reduce wiring inductance. To prevent malfunction, wiring of point E should be connected to the terminal of the shunt resistor R₄ as close as possible.
- 18. To prevent errors of the protection function, the wiring of B, C and D point should be as short as possible.
- 19. In the short-circuit protection circuit, please select the R_6C_6 time constant in the range 1.5~2 μ s.
- 20. Each capacitor should be mounted as close to the pins of the ASPM27 product as possible.
- 21. To prevent surge destruction, the wiring between the smoothing capacitor C₇ and the P & GND pins should be as short as possible. The use of a high-frequency non-inductive capacitor between the P & GND pins is recommended.
- 22. Relays are used at almost every systems of electrical equipment at industrial application. In these cases, there should be sufficient distance between the CPU and the relays.
- 23. The zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (Recommended zener diode is 22 V/1 W. which has the lower zener impedance characteristic than about 15 Ω).
- 24. C₂ of around 7 times larger than bootstrap capacitor C₃ is recommended.
- 25. Choose the electrolytic capacitor with good temperature characteristic in C_3 . Also choose 0.1~0.2 μF R-category ceramic capacitors with good temperature and frequency characteristics in C_4 .
