Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. # FUSB301A

## Autonomous USB Type-C Controller with Configurable I<sup>2</sup>C Address

### Features

- Fully Autonomous Type-C Controller Supports Type-C Versions 1.1 and 1.0
- V<sub>DD</sub> Operating Range, 3.0 V- 5.5 V
- Low Disable Power: I<sub>CC</sub> = 2.0 μA (Max.)
- Low Standby Power: I<sub>CC</sub> = 7.0 μA (Max.)
- DRP Mode with Optional Accessory Support
- Configurable I<sup>2</sup>C Address
- Capable of Supporting Try.SNK and Try.SRC
- Dead Battery Support (SINK Support when No Power Applied)
- 2 kV HBM ESD Protection
- Small Packaging, 12 Lead TMLP (1.6 mm x 1.6 mm x 0.375 mm)

### Description

The FUSB301A is a fully autonomous Type-C controller optimized for <15 W applications. The FUSB301A offers CC logic detection for Source Mode, Sink Mode, DRP, accessory detection support, and dead battery support. The FUSB301A features configurable I<sup>2</sup>C address to support multiple ports per system. The FUSB301A features an extremely low power disable mode as well as low power during normal operation. It is available in an ultra thin, 12-Lead TMLP package.

### Applications

- Smartphones
- Tablets
- Notebooks
- Ultra Portable Applications

## Pin Descriptions

Pin #	Name	Type	Description
<b>USB Type-C Connector Interface</b>			
1, 2	CC1, CC2	I/O	Type-C Configuration Channel
4	VBUS	Input	VBUS input pin for attach and detach detection
10	GND	Ground	Ground
<b>Power Interface</b>			
12	VDD	Power	Input Supply Voltage
<b>Signal Interface</b>			
8	SCL	Input	I <sup>2</sup> C serial clock signal to be connected to the I <sup>2</sup> C master.
7	SDA	Open-Drain I/O	I <sup>2</sup> C serial data signal to be connected to the I <sup>2</sup> C master
6	INT_N	Open-Drain Output	Active LOW open drain interrupt output used to prompt the processor to read the I <sup>2</sup> C register bits
9	ID	Open-Drain Output	Used to Identify if connected device is Source or Sink. The ID Pin can be used to interface with USB2.0 Input on the processor.
5	I2CADDR	Input	Used to change bit 3 of the I2C address so that multiple addresses can be used in a system where two device addresses conflict
3	NC1	NC	No Connect – Tie to Ground or Float
11	NC2	NC	No Connect – Tie to Ground or Float

### Dead Battery

If power is not applied to FUSB301A and it is attached to a Source device, then the Source would pull up the CC line connected through the cable. The FUSB301A in response would turn on the pull-down that will bring the CC voltage to a range that the Source can detect an attach and turn on VBUS.

### Power Up, Initialization and Reset, Interrupt Operation

When power is first applied, the FUSB301A will power up in Sink mode with all interrupts masked. The local processor must configure the FUSB301A to the desired mode and clear the global interrupt mask bit, INT\_MASK. The INT\_N pin is an active low, open drain output. This pin indicates to the host processor that an interrupt has occurred in the FUSB301A which needs

attention. The INT\_N pin is in a high impedance state by default after power-up or device reset, and the global interrupt mask (INT\_MASK in Control register) is set. After INT\_MASK bit is cleared by the local processor, the INT\_N pin stays high impedance in preparation of future interrupts. When an interruptible event occurs, INT\_N is driven LOW and is in a high impedance state again when the processor clears the interrupt by reading the interrupt registers. Subsequent to the initial power up or reset; if the processor writes a “1” to global interrupt mask bit when the system is already powered up, the INT\_N pin stays in a high impedance state and ignores all interrupts until the global interrupt mask bit is cleared. If an event happens that would ordinarily cause an interrupt when the global interrupt mask bit is set, the INT\_N pin goes LOW when the global interrupt mask is cleared.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>BUS</sub>	VBUS Supply Voltage	3.7	5.0	21	V
V <sub>DD</sub>	Supply Voltage	2.8 <sup>(1)</sup>	3.3	5.5	V

**Notes:**

- Guaranteed by characterization. Not production tested
- A fast-mode I<sup>2</sup>C-bus device can be used in a standard-mode I<sup>2</sup>C-bus system, but the requirement t<sub>SU,DAT</sub> ≥ 250 ns must be met. This is automatically the case if the device does not stretch the LOW period of the I2C\_SCL signal. If such a device does stretch the LOW period of the I2C\_SCL signal, it must output the next data bit to the I2C\_SDA line t<sub>r\_max</sub> + t<sub>SU,DAT</sub> = 1000 + 250 = 1250 ns (according to the standard-mode I<sup>2</sup>C bus specification) before the I2C\_SCL line is released.
- C<sub>b</sub> equals the total capacitance of one bus line in pF. If mixed with high-speed devices, faster fall times are allowed according to the I<sup>2</sup>C specification.

## I<sup>2</sup>C Interface

The FUSB301A includes a full I<sup>2</sup>C slave controller. The I<sup>2</sup>C slave fully complies with the I<sup>2</sup>C specification version 6 requirements. This block is designed for fast mode. Examples of an I<sup>2</sup>C write and read sequence are shown Figure 5 and Figure 6 respectively.

**Note:** Single Byte read is initiated by Master with P immediately following first data byte

**Figure 5. I<sup>2</sup>C Write Example**

**Note:** If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed

	From Master to Slave	<b>S</b>	Start Condition	<b>NA</b>	NOT Acknowledge (SDA High)	<b>RD</b>	Read =1
	From Slave to Master	<b>A</b>	Acknowledge (SDA Low)	<b>WR</b>	Write=0	<b>P</b>	Stop Condition
