

**5.5GHz 1:4 FANOUT BUFFER/  
TRANSLATOR w/400mV LVPECL  
OUTPUTS AND INTERNAL INPUT TERMINATION**

**Precision Edge®  
SY58022U**

**FEATURES**

- Precision 1:4, 400mV LVPECL fanout buffer
- Guaranteed AC performance over temperature and voltage:
  - >5.5GHz  $f_{MAX}$  clock
  - <80ps  $t_r/t_f$  times
  - <250ps ( $V_{IN} \geq 300mV$ )  $t_{pd}$
  - <15ps max. skew
- Low jitter performance:
  - <10ps<sub>pp</sub> total jitter (clock)
  - <1ps<sub>RMS</sub> random jitter (data)
  - <10ps<sub>pp</sub> deterministic jitter (data)
- Accepts an input signal as low as 100mV
- Unique input termination and  $V_T$  pin accepts DC- and AC-coupled differential inputs: LVPECL, LVDS and CML
- 400mV LVPECL compatible outputs
- Power supply 2.5V ±5% and 3.3V ±10%
- -40°C to +85°C temperature range
- Available in 16-pin (3mm × 3mm) MLF® package

**APPLICATIONS**

- All SONET and All GigE clock distribution
- Fibre Channel clock and data distribution
- Backplane distribution
- Data distribution: OC-48, OC-48+FEC, XAUI
- High-end, low-skew, multiprocessor synchronous clock distribution

**DESCRIPTION**

The SY58022U is a 2.5V/3.3V precision, high-speed, fully differential 1:4 LVPECL fanout buffer. Optimized to provide four identical output copies with less than 15ps of skew and less than 10ps<sub>pp</sub> total jitter, the SY58022U can process clock signals as fast as 5.5GHz.

The differential input includes Micrel's unique, 3-pin input termination architecture interfaces to differential LVPECL, CML, and LVDS signals (AC- or DC-coupled) as small as 100mV without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an on-board output reference voltage ( $V_{REF-AC}$ ) is provided to bias the  $V_T$  pin. The outputs are 400mV LVPECL compatible, with extremely fast rise/fall times guaranteed to be less than 80ps.

The SY58022U operates from a 2.5V ±5% supply or 3.3V ±10% supply and is guaranteed over the full industrial temperature range (-40°C to +85°C). For applications that require greater output swing or CML compatible outputs, consider the SY58021U 1:4 fanout buffer with LVPECL outputs, or the SY58020U 1:4 fanout buffer with 400mV CML outputs. The SY58022U is part of Micrel's high-speed, Precision Edge® product line. All data sheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

**PIN DESCRIPTION**

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair receives the signal to be buffered. Each pin is internally terminated with 50Ω to the V <sub>T</sub> pin. Note that this input will default to an indeterminate state if left open. See “Input Interface Applications” section.
2	VT	Input Termination Center-Tap: Each input terminates to this pin. The V <sub>T</sub> pin provides a center-tap for each input (IN, /IN) to the termination network for maximum interface flexibility. See “Input Interface Applications” section.
3	VREF-AC	Reference Output Voltage: This output biases to V <sub>CC</sub> -1.2V. It is used when AC-coupling to differential inputs. Connect V <sub>REF-AC</sub> directly to the V <sub>T</sub> pin. Bypass with 0.01μF low ESR capacitor to V <sub>CC</sub> . See “Input Interface Applications” section.
8, 13	VCC	Positive Power Supply: Bypass with 0.1μF//0.01μF low ESR capacitors as close to the pins as possible. A 0.01μF capacitor should be as close to the V <sub>CC</sub> pin as possible.
5, 16	GND, Exposed Pad	Ground. Exposed pad must be connected to a ground plane that is the same potential as the ground pin.
14, 15 11, 12 9, 10 6, 7	/Q0, Q0, /Q1, Q1, /Q2, Q2, /Q3, Q3,	LVPECL Differential Output Pairs: Differential buffered output copy of the input signal. The output swing is typically 400mV. Proper termination is 50Ω to V <sub>CC</sub> -2V at the receiving end. Unused output pairs may be left floating with no impact on jitter or skew. See “LVPECL Output Termination” section.

**Notes:**

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATINGS conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.
4. Due to the limited drive capability, use for input of the same package only.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6.  $V_{IH}$  (min.) not lower than 1.2V.

**Notes:**

7. Skew is measured between outputs of the same bank under identical transitions.
8. Skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
9. Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles,  $T_n - T_{n-1}$  where T is the time between rising edges of the output signal.
10. Total jitter definition: with an ideal clock input of frequency  $\leq f_{MAX}$ , no more than one output edge in  $10^{12}$  output edges will deviate by more than the specified peak-to-peak jitter value.
11. Random jitter is measured with a K28.7 comma detect character pattern, measured at 2.5Gbps/3.2Gbps.
12. Deterministic jitter is measured at 2.5Gbps/3.2Gbps with both K28.5 and  $2^{23}-1$  PRBS pattern.

## OUTPUT TERMINATION RECOMMENDATIONS

LVPECL outputs have very low output impedance (open emitter), and small signal swing which results in low EMI (electro-magnetic interference). The LVPECL is ideal for driving 50Ω- and 100Ω-controlled impedance transmission lines. In addition, LVPECL is compatible for driving standard

PECL inputs since PECL inputs require only 100mV input swing. Further, there are several techniques in terminating the LVPECL outputs, as shown in Figure 4 through 6.

**Figure 4. Parallel Termination–Thevenin Equivalent**

**Notes:**

1. For +2.5V systems: R1 = 250Ω, R2 = 62.5Ω.
2. For +3.3V systems: R1 = 130Ω, R2 = 83Ω.

**Figure 5. Three-Resistor “Y-Termination”**

**Notes:**

1. Power-saving alternative to Thevenin termination.
2. Place termination resistors as close to destination inputs as possible.
3. R<sub>b</sub> resistor sets the DC bias voltage, equal to V<sub>T</sub>.  
For +2.5V systems R<sub>b</sub> = 19Ω.  
For +3.3V systems R<sub>b</sub> = 46Ω to 50Ω.
4. C1 is an optional bypass capacitor intended to compensate for any t<sub>r</sub>/t<sub>f</sub> mismatches.

**Figure 6. Terminating Unused I/O**

**Notes:**

1. Unused output (/Q) must be terminated to balance the output.
2. For +2.5V systems: R1 = 250Ω, R2 = 62.5Ω, R3 = 1.25kΩ, R4 = 1.2kΩ.  
For +3.3V systems: R1 = 130Ω, R2 = 82Ω, R3 = 1kΩ, R4 = 1.6kΩ.
3. Unused output pairs (Q and /Q) may be left floating.
