## UM-DA7202 evaluation board

### 3 Introduction

DA7202 is a powerful, highly efficient, low EMI Class D speaker driver that can drive 10 W into 4  $\Omega$  loads directly from a 2S lithium-ion battery to power a variety of two cell portable applications such as Ultrabooks™ and tablets.

The DA7202 performance evaluation board (189-01-A) has been produced to allow measurement and evaluation of the DA7202 device.

The evaluation board (EVB) is supplied with a USB memory stick containing supporting collateral.

Figure 1: DA7202 performance EVB

UM-DA7202 evaluation board

### 4 DA7202 EVB hardware description

The DA7202 EVB consists of the DA7202 device, the essential external components and connection points for input / output signals. Typical external connections are shown in Figure 2.

The EVB can be used standalone or as a module for interface to a customer development platform.

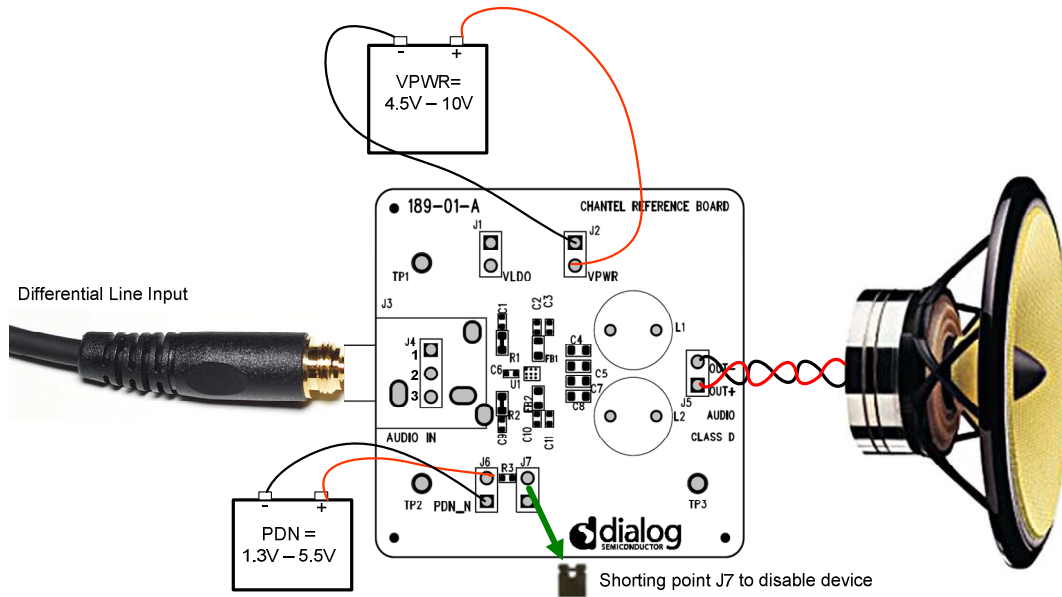

Figure 2: DA7202 performance EVB external connections

## UM-DA7202 evaluation board

Table 1: Connector summary

Connector	Functionality	Description
J1	Internal VLDO monitoring	VLDO (No external connection needed) Pin 1 = GND Pin 2 = LDO output
J2	VPWR external power supply connection	VPWR Pin 1 = 0 V/GND Pin 2 = +4.5 V to +10.0 V
J3	AUDIO IN	Differential line input via 3-pole, 3.5 mm jack socket Ring = IN+ Tip = IN- Sleeve = GND
J4	AUDIO IN (optional input)	Differential line input connection points accessible via the underside of the board or by removing J3 Pin 1 = 0 V/GND Pin 2 = IN+ Pin 3 = IN-
J5	AUDIO OUT	Class D output Pin 1 = OUT+ Pin 2 = OUT-
J6	PDN_N external power supply connection	PDN_N Pin 1 = GND Pin 2 = +1.3 V to +5.5 V
J7	PDN_N status select	<b>Open = DA7202 Power Up (weak pull up to voltage on J6) (Default)</b> Short = DA7202 Power Down
TP1 – TP3	Ground reference points	Ground

## UM-DA7202 evaluation board

### 4.1 Power supply

The DA7202 has high power supply rejection ratio (PSRR) and may be run directly from a 2S lithium-ion battery or, for evaluation purposes, a bench supply.

### 4.2 Analogue input

The analogue input connection contains DC block capacitors (C1 and C9) which allow an input signal with any DC level within the recommended operating conditions to be connected.

#### 4.2.1 Lower gain configuration

DA7202 has a fixed +18 dB gain in the signal path. The input signal amplitude can be reduced with an external resistor creating a divider with the internal device impedance. This can be achieved by replacing resistor sites R1 and R2 (shorted by default) with resistor values using the following formula:

$$A_v = 20\text{Log}\left(\frac{240 \text{ k}\Omega}{R_x}\right)$$

$$R_x = 30 \text{ k}\Omega + R_{\text{ext}}$$

Where:

- 30 k $\Omega$  = the input impedance for DA7202
- $R_{\text{ext}}$  = the resistor value required at both R1 and R2

#### 4.2.2 Single-ended input

In normal operation, the input to the EVB is differential. To use a single-ended input, connect the input signal to J4 pin 2 and the 0 V/GND to J4 pin 3, see schematic diagram in Figure 3.

J4 can be accessed from the rear of the board. Alternatively, J3 can be removed for top access to J4.

### 4.3 Speaker output

An inductive 4  $\Omega$  or 8  $\Omega$  speaker load can be connected directly to J5. The length of the speaker cable must be kept as short as possible to minimise electromagnetic interference (EMI).

#### 4.3.1 Additional filtering

There is no EMI filtering on the EVB as default. As can be seen from the schematic diagram in Figure 3, provision has been made to allow a filter to be added to sites FB1, FB2, C10, C11, C2 and C3, as well as L1, L2, C12 and C13. Examples of when the filtering options can be useful are if the speaker load is non-inductive or if the speaker cable is long.

As default, the shorting points at SP1 and SP2 are short via a solder connection to bypass the filter but allow the output signal to reach J5.
