Datasheet – production data

### Features

- Wide supply voltage: 5.5 V to 16.8 V
- Low operating current: 6 mA typical at 25 °C
- Gain bandwidth product: 1 MHz
- High current COM amplifier:  $\pm 100$  mA output current
- Industrial temperature range: -40 °C to +85 °C
- Small package: TQFP48
- Automotive qualification

### Application

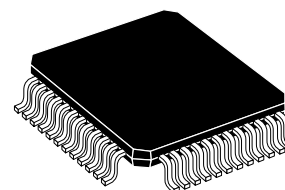

- TFT liquid crystal display (LCD)

### Description

The TSL1014 device is composed of 14 + 1 channel buffers which are used to buffer the reference voltage for gamma correction in thin film transistor (TFT) liquid crystal displays (LCD).

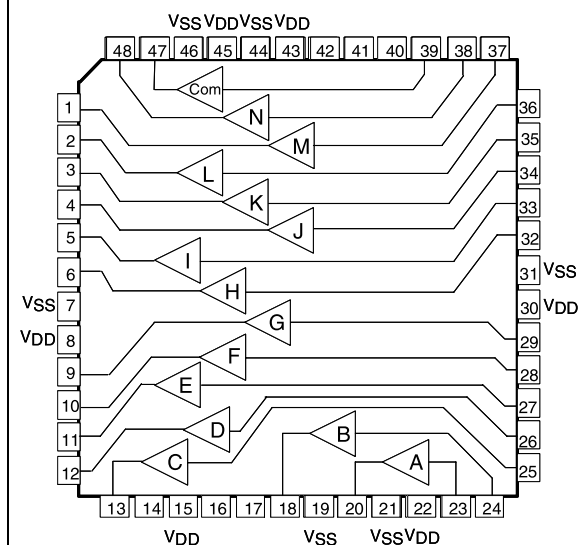

One “COM” amplifier is able to deliver high output current value, up to  $\pm 100$  mA. Amplifiers A and B feature positive single supply inputs for common mode voltage behavior. The amplifiers C to N inclusive, and the COM amplifier, feature negative single supply inputs and are dedicated to the highest and lowest gamma voltages.

The TSL1014 device is fully characterized and guaranteed over a wide industrial temperature range (-40 to +85 °C).

I <sub>SC</sub>	Short-circuit current (A to N buffers) Short-circuit current (COM buffer)	±120 ±300	mA
P <sub>D</sub>	Power dissipation <sup>(1)</sup> for TQFP48	1470	mW
R <sub>THJA</sub>	Thermal resistance junction-to-ambient for TQFP48	85	°C/W
T <sub>LEAD</sub>	Lead temperature (soldering 10 seconds)	260	°C

1. P<sub>D</sub> is calculated with T<sub>amb</sub> = 25 °C, T<sub>J</sub> = 150 °C and R<sub>THJA</sub> = 85 °C/W for the TQFP48 package.
2. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kW resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
3. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 W). This is done for all couples of connected pin combinations while the other pins are floating.
4. Charged device model: all pins and package are charged together to the specified voltage and then discharged directly to ground through only one pin.

**Table 2. Operating conditions**

Symbol	Parameter	Value	Unit

## 2 Typical application schematics

Figure 1. Typical application schematic for the TSL1014 device

Note that:

- Amplifiers **A** and **B** have their input voltage in the range  $V_{SS} + 1.5\text{ V}$  to  $V_{DD}$ . This is why they must be used for high level gamma correction voltages.
- Amplifiers **C** to **N** have their input voltage in the range  $V_{SS}$  to  $V_{DD} - 1.5\text{ V}$ . This is why they must be used for medium-to-low level gamma correction voltages.
- Amplifier **COM** has its input voltage range from  $V_{SS}$  to  $V_{DD} - 1.5\text{ V}$ .
