## 1 Overview

### Features

- Quad D-MOS switch driver
- Free configurable as bridge or quad-switch
- Optimized for DC motor management applications
- Low  $R_{DS\ ON}$   
High side: 70 m $\Omega$  typ. @ 25°C, 180 m $\Omega$  max. @ 150°C  
Low side: 40 m $\Omega$  typ. @ 25°C, 80 m $\Omega$  max. @ 150°C
- Peak current: typ. 15 A @ 25 °C
- Very low quiescent current: typ. 5  $\mu$ A @ 25 °C
- Small outline, enhanced power PG-DSO-package
- Operates up to 40 V
- Load and GND-short-circuit-protection
- Overtemperature shut down with hysteresis
- Undervoltage detection with hysteresis
- Status flag diagnosis
- Internal clamp diodes
- Isolated sources for external current sensing
- Green Product (RoHS compliant)
- AEC Qualified

PG-DSO-28-22

### Description

The **BTM7710G** is part of the **TrilithIC** family containing three dies in one package: One double high-side switch and two low-side switches. The drains of these three vertical DMOS chips are mounted on separated lead frames. The sources are connected to individual pins, so the **BTM7710G** can be used in H-bridge- as well as in any other configuration. The double high-side switch is manufactured in SMART SIPMOS® technology which combines low  $R_{DS\ ON}$  vertical DMOS power stages with CMOS circuitry for control, protection and diagnosis. To achieve low  $R_{DS\ ON}$  and fast switching performance, the low-side switches are manufactured in S-FET logic level technology.

## 4 Circuit Description

### 4.1 Input Circuit

The control inputs IH1,2 consist of TTL/CMOS compatible Schmitt-Triggers with hysteresis. Buffer amplifiers are driven by these stages and convert the logic signal into the necessary form for driving the power output stages. The inputs are protected by ESD clamp-diodes. The inputs IL1 and IL2 are connected to the gates of the standard N-channel vertical power-MOS-FETs.

### 4.2 Output Stages

The output stages consist of an low  $R_{\text{DS(ON)}}$  Power-MOS H-bridge. In H-bridge configuration, the D-MOS body diodes can be used for freewheeling when communicating inductive loads. If the high-side switches are used as single switches, positive and negative voltage spikes which occur when driving inductive loads are limited by integrated power clamp diodes.

### 4.3 Short Circuit Protection

The outputs are protected against short circuit to ground and short circuit over load

An internal OP-Amp controls the Drain-Source-Voltage by comparing the DS-Voltage-Drop with an internal reference voltage. Above this trip point the OP-Amp reduces the output current depending on the junction temperature and the drop voltage.

### 4.4 Overtemperature Protection

The high-side switches also incorporate an over temperature protection circuit with hysteresis which switches off the output transistors and sets the status output to low.

### 4.5 Undervoltage Lockout

When  $V_{\text{S}}$  reaches the switch-on voltage  $V_{\text{UVON}}$  the IC becomes active with a hysteresis. The high-side output transistors are switched off if the supply voltage  $V_{\text{S}}$  drops below the switch off value  $V_{\text{UVOFF}}$ .

### 4.6 Status Flag

The status flag output is an open drain output with zener-diode which requires a pull-up resistor, as shown in the application circuit in [Figure 4 “Application Example BTM7710G” on Page 15](#). Various errors as listed in the table “Diagnosis” are reported by switching the open drain output ST to low.

**Table 3 Truth table and Diagnosis (valid only for the High-Side-Switches)**

Flag	IH1	IH2	SH1	SH2	ST	Remarks
	Inputs		Outputs

1) Not subject to production test; specified by design

2) Single pulse

3) Internally limited

4) ESD susceptibility HBM according to EIA/JESD22-A114-B (1.5kΩ, 100pF)

*Note: Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

*Note: Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.*

## 5.2 Functional Range

Pos.	Parameter	Symbol	Limit Values		Unit	Remarks
			min.	max.		
5.2.20	Supply voltage	$V_S$	$V_{UVOFF}$	42	V	After $V_S$ rising above $V_{UVON}$

### Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
