

Brief Description

The ZSSC3136 is a member of the ZSSC313x family of CMOS integrated circuits for automotive/ industrial sensor applications. All family members are well suited for highly accurate amplification and sensor-specific correction of resistive bridge sensor signals. An internal 16-bit RISC microcontroller running a correction algorithm compensates sensor offset, sensitivity, temperature drift, and non-linearity of the connected sensor element. The required calibration coefficients are stored by the one-pass calibration procedure in an on-chip EEPROM.

The ZSSC3136 is optimized for SIL (Safety Integrity Level) rated switch applications. The integrated adjustable digital filter offers the possibility of setting up fast switching real-time applications as well as stabilized switching applications in the case of disturbed or unstable input signals.

In addition to the general features for switch applications, the ZSSC3136 offers the capability to set up safety-relevant SIL2 rated switches due to its extended safety functionalities.

Features

- Analog gain of 105, maximum overall gain of 420
- Sample rate: 200 Hz maximum
- ADC resolution: 13/14 bit
- External temperature sensor
- Safety functionalities: Calibration microcontroller, sensor connection, analog front-end
- Adjustable to nearly all resistive bridge sensor types
- Digital compensation of sensor offset, sensitivity, temperature drift, and non-linearity
- Output options: ratiometric analog voltage output (5 - 95% in maximum, 12.4 bit resolution) or ZACwire™ (digital One-Wire Interface (OWI))
- Sensor biasing by voltage
- High voltage protection up to 33 V
- Supply current: max. 5.5mA
- Reverse polarity and short circuit protection
- Wide operation temperature: -40 to +150°C
- Traceability by user-defined EEPROM entries

* Note: I²C™ is a trademark of NXP.

** FSO = Full Scale Output.

Benefits

- Capability for setting up SIL level 2 applications
- Application-focused feature set
- No external trimming components required
- Only a few external protection devices needed
- PC-controlled configuration and one-pass/ end-of-line calibration via I²C™* or ZACwire™ interface: simple, cost-efficient, quick, and precise
- High accuracy (0.25% FSO** @ -25 to +85°C; 0.5% FSO @ -40 to +125°C)
- Optimized for automotive/ industrial environment due to robust protection circuitries, excellent electromagnetic compatibility and AEC-Q100 qualification

Available Support

- Evaluation Kits
- Application Notes
- Mass Calibration System

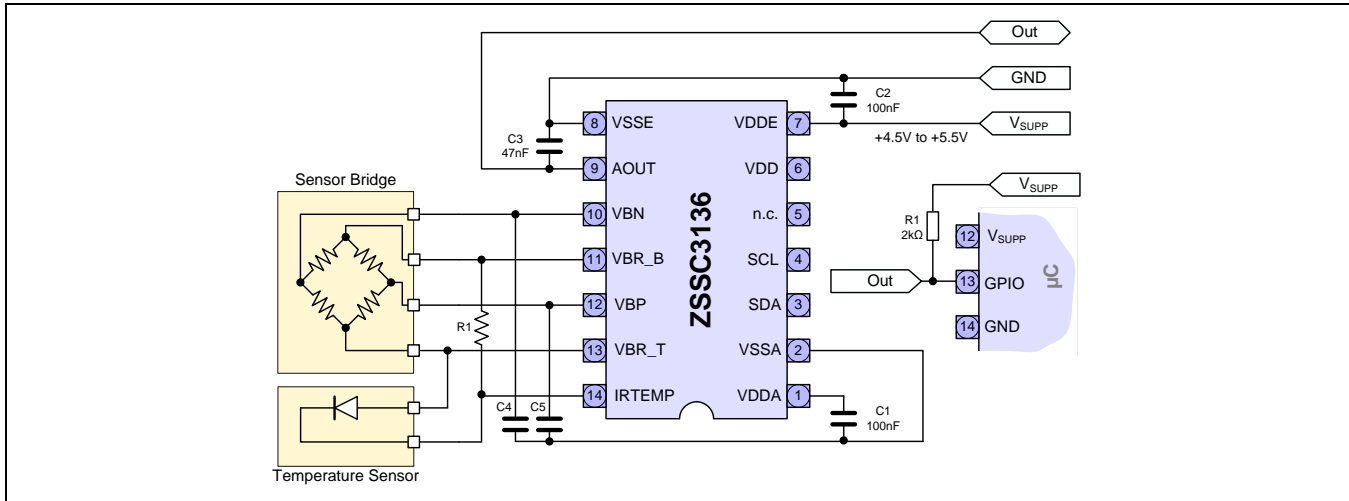

Physical Characteristics

- Supply voltage 4.5 to 5.5 V
- Operation temperature: -40°C to +125°C (-40°C to +150°C extended temperature range depending on product version)
- Available in RoHS-compliant JEDEC-SSOP14 package or delivery as die

ZSSC3136 Minimum Application Requirements

ZSSC3136 Switch Application Example

Ordering Information *(See data sheet section 8 for complete delivery options.)*

Product Sales Code	Description	Package

1 Electrical Characteristics

1.1. Absolute Maximum Ratings

Parameters apply in operation temperature range and without time limitations.

Table 1.1 Absolute Maximum Ratings

No.	Parameter	Symbol	Conditions	Min	Max	Unit
1.1.1	Supply voltage ¹⁾	VDDE _{AMR}	To VSSE, refer to section 3 for application circuits	-33	33	VDC
1.1.2	Potential at AOUT pin ¹⁾	V _{OUT}	Referenced to VSSE	-33	33	VDC
1.1.3	Analog supply voltage ¹⁾	VDDA _{AMR}	Referenced to VSSA, VDDE - VDDA < 0.35V	-0.3	6.5	VDC
1.1.4	Voltage at all analog and digital IO pins	V _{A_IO} V _{D_IO}	Referenced to VSSA	-0.3	VDDA + 0.3	VDC
1.1.5	Storage temperature	T _{STG}		-55	150	°C
1) Refer to the ZSSC313x <i>Technical Note—High Voltage Protection</i> for specification and detailed conditions.						

1.2. Operating Conditions

All voltages are referenced to VSSA.

Table 1.2 Operating Conditions

No.	Parameter	Symbol	Conditions	Min	Typ	Max	Unit
1.2.1	Ambient temperature ^{1) 2)}	T _{AMB_TQE}	Extended Temperature Range (TQE)	-40		150	°C
		T _{AMB_TQA}	Advanced-Performance Temperature Range (TQA)	-40		125	°C
		T _{AMB_TQI}	Best-Performance Temperature Range (TQI)	-25		85	°C
1.2.2	Supply voltage	VDDE		4.5	5.0	5.5	VDC
1.2.3	Bridge resistance ^{3) 4)}	R _{BR}		2		25	kΩ
1) Maximum operation temperature range depends on product version (refer to section 8). 2) See the temperature profile description in the ZSSC313x <i>Technical Note Die & Package Dimensions</i> . 3) No measurement in mass production, parameter is guaranteed by design and/or quality observation. 4) Symmetric behavior and identical electrical properties (especially the low pass characteristic) of both sensor inputs of the ZSSC3136 are required. Unsymmetrical conditions of the sensor and/or external components connected to the sensor input pins of the ZSSC3136 can generate a failure in signal operation.							

1.3. Electrical Parameters

All parameter values are valid under the operating conditions specified in section 1.2 (special definitions excluded). All voltages referenced to VSSA.

Note: See important notes at the end of Table 1.3.

Table 1.3 Electrical Parameters

No.	Parameter	Symbol	Conditions	Min	Typ	Max	Unit
1.3.1. Supply Current and System Operation Conditions							
1.3.1.1	Supply current	I_S	Without bridge and load current, $f_{OSC} \leq 3$ MHz			5.5	mA
1.3.1.2	Oscillator frequency ¹⁾	f_{OSC}	Adjustment guaranteed for whole temperature range (T_{AMB_TQE})	2	3	4	MHz

1.3.6.10	INL TQE	INL_{OUT_TQE}	Best fit, $r_{DAC}=12\text{bit}$, temperature range T_{AMB_TQE}	-8		8	LSB
1.3.6.11	Output leakage current at 150°C	I_{OUT_LEAK}	In case of power or ground loss	-25		25	μA

No.	Parameter	Symbol	Conditions	Min	Typ	Max	Unit
1.3.7. System Response							
1.3.7.1	Startup time ^{1) 3)} (To 1 st output, ROM check disabled)	t _{STARTUP}	1-step ADC, f _{OSC} =3MHz r _{ADC} =14bit)			35	ms
1.3.7.2	Response time ¹⁾ (100% input step; refer to Table 2.2)	t _{RESPONSE}	1-step ADC, f _{OSC} =4MHz, r _{ADC} =13bit	8.7	13.1	17.4	ms
1.3.7.3	Bandwidth ¹⁾ (In comparison to an equivalent analog SSC. Refer to Table 2.2)	BW	1-step ADC			200	Hz
1.3.7.4	Analog output noise peak-to-peak ¹⁾	V _{NOISE_PP}	Shorted inputs bandwidth ≤ 10kHz			10	mV
1.3.7.5	Analog output noise RMS ¹⁾	V _{NOISE_RMS}	Shorted inputs bandwidth ≤ 10kHz			3	mV
1.3.7.6	Ratiometricity error	RE	Maximum error for VDDE=5V to 4.5/5.5V			1000	ppm
1.3.7.7	Overall failure Deviation from ideal line including INL, gain, offset and temperature errors. No sensor-caused effects. Failure for digital readout shown in parenthesis.	F _{OVERALL_TQI}	f _{OSC} ≤3MHz, r _{ADC} =13bit, temperature range T _{AMB_TQI}		0.25 (0.1)		% FS
		F _{OVERALL_TQA}	f _{OSC} ≤3MHz, r _{ADC} =13bit, temperature range T _{AMB_TQA}		0.5 (0.25)		% FS
		F _{OVERALL_TQE}	f _{OSC} ≤3MHz, r _{ADC} =13bit, temperature range T _{AMB_TQE}		1.0 (0.5)		% FS
1) No measurement in mass production, parameter is guaranteed by design and/or quality observation. 2) Minimum output voltage to VDDE or maximum output voltage to VSSE. 3) Depends on resolution and configuration. Start routine begins approximately 0.8ms after power on.							

1.4. Interface Characteristics and EEPROM

Table 1.4 Interface Characteristics and EEPROM

No.	Parameter	Symbol	Conditions	Min	Typ	Max	Unit
1.4.1. I²C™ Interface (Refer to the ZSSC313x Functional Description for timing details)							
1.4.1.1	I ² C voltage level HIGH	V _{I²C,HIGH}		0.8			VDDA
1.4.1.2	I ² C voltage level LOW ¹⁾	V _{I²C,LOW}				0.2	VDDA
1.4.1.3	Slave output level LOW ¹⁾	V _{I²C,LOW_OUT}	Open drain, I _{OL} <2mA			0.15	VDDA
1.4.1.4	SDA load capacitance ¹⁾	C _{SDA}				400	pF
1.4.1.5	SCL clock frequency ¹⁾	f _{IC}	f _{OSC} ≥2MHz			400	kHz
1.4.1.6	Internal pull-up resistor ¹⁾	R _{I²C,PULLUP}		25		100	kΩ
1.4.2. ZACwire™ One-Wire Interface (OWI) (Refer to the ZSSC313x Functional Description for timing details)							
1.4.2.1	OWI voltage level HIGH ¹⁾	V _{OWI,HIGH}		0.75			VDDA
1.4.2.2	OWI voltage level LOW ¹⁾	V _{OWI,LOW}				0.2	VDDA
1.4.2.3	Slave output level LOW ¹⁾	V _{OWI,LOW_OUT}	Open drain, I _{OL} <2mA			0.15	VDDA
1.4.2.4	Start window ¹⁾	t _{OWI,STARTWIN}	At f _{OSC} =3MHz	96	175	455	ms
1.4.3. EEPROM							
1.4.3.1	Ambient temperature for EEPROM programming ¹⁾	T _{AMB_EEP}		-40		150	°C
1.4.3.2	Write cycles ¹⁾	n _{EEP_WRI}	Write ≤ 85°C			100 000	
			Write up to 150°C			100	
1.4.3.3	Read cycles ^{1) 2)}	n _{EEP_READ}	≤175°C			8 * 10 ⁸	
1.4.3.4	Data retention ^{1) 3)}	t _{EEP_RETENTION}	1300h at 175°C (= 3000h at 150°C + 27000h at 125°C + 100000h at 55°C)			15	a
1.4.3.5	Programming time ¹⁾	t _{EEP_WRI}	Per written word		12		ms
¹⁾ No measurement in mass production, parameter is guaranteed by design and/or quality observation. ²⁾ Valid for the dice. Note that the package and the temperature version causes additional restrictions. ³⁾ Over lifetime and valid for the dice. Use the calculation sheet <i>IDT Temperature Profile Calculation Sheet</i> for temperature stress calculation. Note that the package and the temperature version causes additional restrictions.							

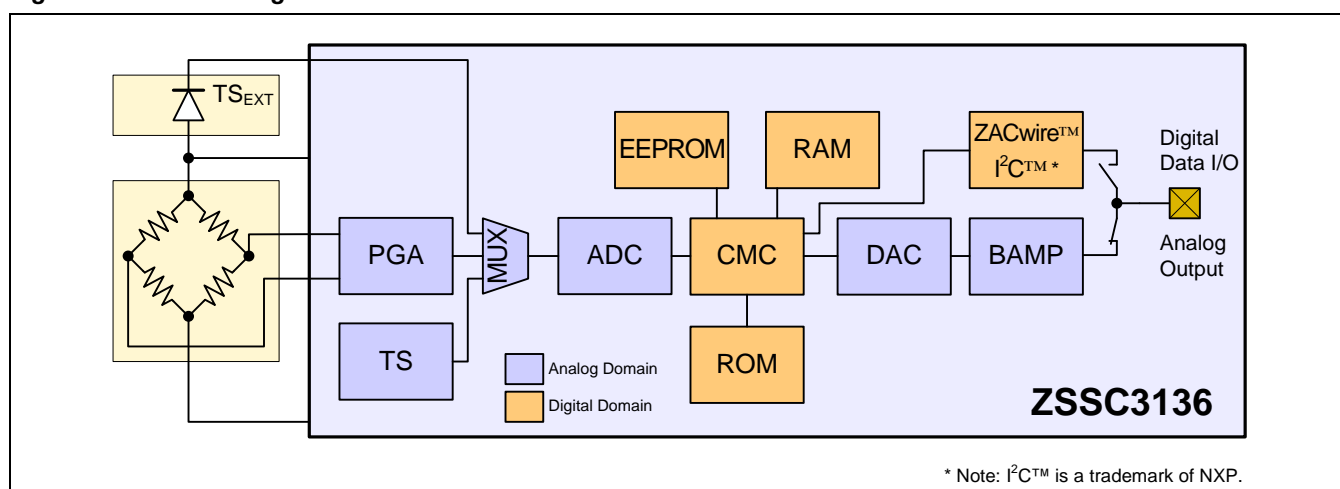

2 Circuit Description

2.1. Signal Flow

The ZSSC3136's signal path is partly analog and partly digital. The analog section is differential – this means the differential bridge sensor signal is internally handled via two signal lines that are rejected symmetrically around an internal common mode potential (analog ground = $V_{DDA}/2$).

As a result of the differential design, it is possible to amplify positive and negative input signals that are within the common mode range of the signal input.

Figure 2.1 Block Diagram of the ZSSC3136

PGA	Programmable Gain Amplifier
TS	On-chip Temperature Sensor (pn-junction)
TS _{EXT}	External Temperature Sensor (pn-junction)
MUX	Multiplexer
ADC	Analog-to-Digital Converter
CMC	Calibration Microcontroller
ROM	Read-Only Memory for Correction Formula and Algorithm
RAM	Volatile Memory for Calibration Parameters and Configuration
EEPROM	Non-volatile Memory for Calibration Parameters and Configuration
DAC	Digital-to-Analog Converter
BAMP	Output Buffer Amplifier

The differential signal from the bridge sensor is pre-amplified by the programmable gain amplifier (PGA). The multiplexer (MUX) transmits the signals from either the bridge sensor or the internal or external temperature sensor to the analog-to-digital converter (ADC) in a specific sequence. The ADC converts these signals into digital values.

The digital signal conditioning is processed by the calibration microcontroller (CMC). It is based on a correction formula that uses sensor-specific coefficients determined during calibration. The formula is located in ROM, and the sensor-specific coefficients are stored in EEPROM. Depending on the programmed output configuration, the conditioned sensor signal is output as an analog signal, or alternatively can be readout via a digital serial interface (I²C™ or ZACwire™). The configuration data and the correction parameters must also be programmed into the EEPROM via the digital interfaces.

2.2. Application Modes

For each application, a configuration set must be established by programming the on-chip EEPROM for the following modes:

- Sensor channel
 - Input range: The gain adjustment of the analog front-end (AFE) with respect to the maximum sensor signal span and the zero point of the A/D conversion must be selected.
 - Resolution/response time: The A/D converter must be configured for resolution. These settings influence the sampling rate and the signal integration time, and thus, the noise immunity.
- Temperature
 - Temperature measurement: Select the internal or external temperature sensor.

2.3. Analog Front-End (AFE)

The analog front-end (AFE) consists of the three-stage programmable gain amplifier (PGA), the multiplexer (MUX), and the analog-to-digital converter (ADC).

2.3.1. Programmable Gain Amplifier (PGA)

Table 2.1 shows the adjustable gains, the sensor signal spans, and the valid common mode range.

Table 2.1 Adjustable Gains, Resulting Sensor Signal Spans and Common Mode Ranges

PGA Gain a_{IN}	Maximum Span V_{IN_SP} [mV/V] ¹⁾	Input Common Mode Range V_{IN_CM} [% VDDA]
105	7.1	29 to 65
70	10.7	29 to 65
52.5	14.3	29 to 65
35	21.4	29 to 65
26.3	28.5	29 to 65
14	53.75	29 to 65
9.3	80	29 to 65
7	107	29 to 65
2.8	267	32 to 57
¹⁾ Recommended maximum internal signal range is 75% of supply voltage. Span is calculated by the following formula: $Span = 0.75 (V_{BR_T} - V_{BR_B}) / Gain$.		

2.3.2. Offset Compensation

The ZSSC3136 processes a sensor-offset correction during the digital signal conditioning by the calibration microcontroller (CMC).

2.3.3. Measurement Cycle

The measurement cycle is controlled by the CMC. Depending on EEPROM settings, the multiplexer (MUX) selects the following input signals in a defined sequence:

- Pre-amplified bridge sensor signal
- Temperature sensor signal
- Internal offset of the input channel (V_{OFF})

The cycle diagram in Figure 2.2 shows the basic structure of the measurement cycle. After power-on, the startup routine is processed, which performs all required measurements to expedite acquiring an initial valid conditioned sensor output. After the startup routine, the normal measurement cycle runs.

Figure 2.2 Measurement Cycle with 1 Bridge Sensor Signal Measurement per Special Measurement

2.3.4. Analog-to-Digital Converter

The A/D converter is implemented using full-differential switched-capacitor technique.

Programmable ADC resolutions are $r_{ADC} = \langle 13, 14 \rangle$ bit.

The A/D conversion is integrating, inherently monotone, and insensitive to short and long term instability of the clock frequency. The conversion time t_{ADC} depends on the desired resolution and can be roughly calculated by equation (1):

$$t_{ADC} = \frac{2^{r_{ADC}}}{\left(\frac{f_{OSC}}{2}\right)} \quad (1)$$

Where

r_{ADC}	Resolution of A/D conversion
f_{OSC}	Frequency of internal oscillator (refer to 1.3.1)

Refer to the *ZSSC313x Bandwidth Calculation Sheet* for a detailed calculation of sampling time and bandwidth.

The result of the A/D conversion is a relative counter result Z corresponding to the following equation:

$$Z = 2^{r_{ADC}} \cdot \left(\frac{V_{ADC_DIFF}}{V_{ADC_REF}} - RS \right) \quad (2)$$

Where

r_{ADC}	Resolution of A/D conversion
V_{ADC_DIFF}	Differential ADC input voltage
V_{ADC_REF}	ADC reference voltage ($V_{VBR_T} - V_{VBR_B}$ or $V_{VDDA} - V_{VSSA}$, if $BRREF=1$)
RS	Digital ADC Range Shift ($RS = 1/16, 1/8, 1/4, 1/2$; controlled by the EEPROM contents)

With the RS value, a sensor input signal can be shifted in the optimal input range of the ADC.

The condition required for ensuring the specified accuracy, stability, and non-linearity parameters of the analog front-end is that the differential ADC input voltage V_{ADC_DIFF} does not exceed the range of 10% to 90% of the ADC reference voltage V_{ADC_REF} . This requirement must be met for the whole temperature range and for all sensor tolerances.

Table 2.2 ADC Resolution versus Output Resolution and Sample Rate

ADC Adjustment	Output Resolution ¹⁾		Sample Rate ²⁾		Averaged Bandwidth ²⁾	
	Digital [bit]	Analog [bit]	f _{osc} =3MHz [Hz]	f _{osc} =4MHz [Hz]	f _{osc} =3MHz [Hz]	f _{osc} =4MHz [Hz]
13	13	12	345	460	130	172
14	14	12	178	237	67	89
1) Output resolution does not exceed ADC resolution. PGA gain should be such that the differential ADC input signal uses at least 50% of ADC input range to ensure maximum achievable output resolution. 2) Refer to the <i>ZSSC313x Bandwidth Calculation Spreadsheet</i> for a detailed calculation of sampling time and bandwidth.						

2.4. Temperature Measurement

The ZSSC3136 supports different methods for acquiring temperature data needed for conditioning of the sensor signal. Temperature data can be acquired using

- an internal pn-junction temperature sensor,
- an external pn-junction temperature sensor connected to the sensor top potential (V_{BR_T}) or
- an external resistive half bridge temperature sensor.

Refer to the *ZSSC313x Functional Description* for a detailed explanation of temperature sensor adaptation and adjustment.

2.5. System Control and Conditioning Calculation

The system control supports the following tasks/features:

- Managing the startup sequence
- Controlling the measurement cycle regarding to the EEPROM-stored configuration data
- Sensor signal conditioning (calculation of the 16-bit correction for each measurement signal using the EEPROM-stored conditioning coefficients and the ROM-based formulas)
- Processing communication requests received via the digital interfaces
- Performing failsafe tasks and message detected errors by setting diagnostic states

2.5.1. General Working Modes

ZSSC3136 supports three different working modes:

- Normal Operation Mode (NOM) – for continuous processing of signal conditioning
- Command Mode (CM) – for calibration and access to all internal registers
- Diagnostic Mode (DM) – for failure messages

2.5.2. Startup Phase ¹

After power-on, the startup phase is processed, which includes

- Internal supply voltage settling including reset of the circuitry by the power-on reset block (POR). Refer to the *ZSSC313x Technical Note—High Voltage Protection* for power-on/off thresholds. Duration (beginning with $V_{DDA}-V_{VSSA}=0V$): 500 μ s to 2ms; AOUT: high impedance.
- System start and configuration, EEPROM readout, and signature check. Duration: ~200 μ s; AOUT: lower diagnostic range (LDR).
- ROM check, if CFGAPP:CHKROM=1. Duration: ~10ms; AOUT: lower diagnostic range (LDR).
- Processing the measurement cycle start routine. Duration: 5x A/D conversion time; AOUT behavior depends on configured one-wire communication mode (refer to section 2.6):
 OWIANA or OWIDIS → AOUT: lower diagnostic range (LDR)
 OWIWIN or OWIENA → AOUT: tri-state

If an error is detected during the startup phase, the Diagnostic Mode (DM) is activated and the analog output at the AOUT pin remains in the lower diagnostic range.

After the startup phase, the continuous running measurement and sensor signal conditioning cycle is started, and analog or digital output of the conditioned sensor signal is activated. If the one-wire communication mode OWIWIN is selected, the OWI startup window expires before analog output is available.

2.5.3. Conditioning Calculation

The digitalized value for the bridge signal is processed with a conditioning formula to remove offset and temperature dependency and to compensate nonlinearity up to 3rd order. The result is a non-negative 15-bit value for the measured bridge sensor signal in the range [0; 1). This value is available for readout via I²C or OWI communication. For the analog output, the value is clipped to the programmed output limits.

Note: The extent of signal deviation that can be compensated by the conditioning calculation depends on the specific sensor signal characteristics. For a rough estimation, assume the following: offset compensation and gain correction are not limited. Notice that resolution of the digitally gained signal is determined by the ADC resolution in respect to the dynamic input range used. The temperature correction includes first and second order terms and should be adequate for all practically relevant cases. The non-linearity correction of the sensor signal is possible for second-order up to about 30% FS regarding ideal fit and for third-order up to about 20% FS. Overall, the conditioning formula applied is able to reduce the non-linearity of the sensor signal by a factor of 10.

¹ All timing values are roughly estimated for an oscillator frequency $f_{osc}=3MHz$ and are proportional to that frequency.

2.6. Analog or Digital Output

The AOUT pin is used for analog output and for one-wire communication (OWI). The latter can be used for digital readout of the conditioned sensor signal and for end-of-line sensor module calibration. The ZSSC3136 supports different modes for the analog output in interaction with OWI communication:

- OWIENA: Analog output is deactivated; OWI readout of the signal data is enabled.
- OWIWIN: Analog output starts after the startup phase and after the OWI startup window if OWI communication is not initiated; OWI communication for configuration or for end-of-line calibration can be started during the OWI startup window (maximum ~500ms) by sending the START_CM command.
- OWIANA: Analog output starts after the startup phase; OWI communication for configuration or for end-of-line calibration can be started during the OWI startup window (maximum ~500ms) by sending the START_CM command; for command transmission, the driven analog output at the AOUT pin must be overwritten by the external communication master (AOUT drive capability is current-limited).
- OWIDIS: Analog output starts after the startup phase; OWI readout of the signal data is disabled.

The analog output signal is driven by an offset compensated, rail-to-rail output buffer that is current-limited to prevent damage to the ZSSC3136 from a short circuit between the analog output and power supply or ground. Output resolution of at least 12-bit in the range of 10% to 90% FS is ensured by a 12.4-bit resistor string DAC.

2.7. Serial Digital Interface

The ZSSC3136 includes a serial digital I²C™ interface and a ZACwire™ interface for one-wire communication (OWI). The digital interfaces allow configuration and calibration of the sensor module. OWI communication can be used to perform an end-of-line calibration via the analog output pin AOUT of a completely assembled sensor module. The interfaces also provide the readout of the conditioned sensor signal data during normal operation.

Refer to the *ZSSC313x Functional Description* for a detailed description of the serial interfaces and the communication protocols.

2.8. Failsafe Features

The ZSSC3136 detects various failures. When a failure is detected, Diagnostic Mode (DM) is activated. DM is indicated by setting the output pin AOUT to the Lower Diagnostic Range (LDR). When using digital serial communication protocols (I²C™ or OWI) to read conditioning results data, the error status is indicated by a specific error code.

A watchdog timer controls the proper operation of the microcontroller. The operation of the internal oscillator is monitored by an oscillator-failure detection circuit. EEPROM and RAM content are checked when accessed. Control registers are parity protected.

The sensor connection is checked with regard to broken wires or short circuits (sensor connection check, sensor short check).

The connection of an external temperature sensor can be monitored by the temperature sensor check.

In addition to these checks, the ZSSC3136, which is optimized for failsafe switch applications, also provides a ROM check after power-on and monitoring of the sensor common mode voltage (sensor aging check).

Refer to the *ZSSC313x Functional Description* for a detailed description of failsafe features and methods of error indication.

2.9. High Voltage, Reverse Polarity, and Short Circuit Protection

The ZSSC3136 is designed for 5V power supply operation.

The ZSSC3136 and the connected sensor are protected from overvoltage and reverse polarity damage by an internal supply voltage limiter. The analog output AOUT can be connected (short circuit, overvoltage, and reverse polarity) with all potentials in the protection range under all potential conditions at the pins VDDE and VSSE.

To guarantee this operation, all external components (see application circuit in section 3) are required. The protection is not time-limited.

Refer to the *ZSSC313x Technical Note—High Voltage Protection* for a detailed description of protection cases and conditions.

3 Application Circuit Examples

The application circuits contain external components that are needed for overvoltage, reverse polarity, and short circuit protection.

Note: Also check the ZSSC313x application notes for application examples and board layout.

Table 3.1 External Components for Application Circuit Examples

Symbol	Component	Min	Typ ²⁾	Max	Unit	Remarks
C1	Capacitor	100		470	nF	
C2	Capacitor	100			nF	
C3 ¹⁾	Capacitor	4	47	160	nF	Value includes the load capacitor C3 and the capacitance of the connection cable.
C4, C5 ¹⁾	Capacitor	0		10	nF	Recommended to increase EMI immunity. Value includes the filter capacitor C4 and C5 and the sensor connection line capacitance.
R1	Resistor		10		kΩ	See Figure 3.3 for location.

1) Increasing capacitors C3, C4, and C5 increases EMI immunity.
2) Dimensioning is only for example and must be adapted to the requirements of the application.

4 Pin Configuration and Package

Table 4.1 Pin Configuration and Definition

Pin No	Pin Name	Description	Remarks
1	VDDA	Positive Analog Supply Voltage	Internal analog supply
2	VSSA	Negative Analog Supply Voltage	Internal analog ground
3	SDA	I ² C™ Serial Data	Digital I/O; internal pull-up to VDDA
4	SCL	I ² C™ Clock	Digital input; internal pull-up to VDDA
5	N.C.	Not connected	
6	VDD	Positive Digital Supply Voltage	Internal digital supply
7	VDDE	Positive External Supply Voltage	High voltage analog supply
8	VSSE	Negative External Supply Voltage	Ground
9	AOUT	Analog Output and ZACwire™ Serial Data	High voltage analog I/O
10	VBN	Negative Input from Sensor Bridge	Analog input
11	VBR_B	Negative Sensor Bridge Supply Voltage	Analog I/O Depending on application circuit, short to VSSA
12	VBP	Positive Input from Sensor Bridge	Analog input
13	VBR_T	Positive Sensor Bridge Supply Voltage	Analog I/O Depending on application circuit, short to VDDA
14	IRTEMP	External Temperature Sensor	Analog I/O

The standard package of the ZSSC3136 is an RoHS-compliant SSOP14 “green” package (5.3mm body width) with a lead pitch of 0.65 mm.

Figure 4.1 ZSSC3136 SSOP14 Pin Diagram

5 ESD Protection

All pins have an ESD protection of >2000V according to the Human Body Model (HBM). The pins VDDE, VSSE and AOUT have an additional ESD protection of >4000V (HBM).

ESD protection is tested with devices in SSOP14 packages during product qualification. The ESD test follows the Human Body Model with 1.5kOhm/100pF based on MIL 883, Method 3015.7.

6 Quality and Reliability

The ZSSC3136 is qualified according to the AEC-Q100 standard, operating temperature grade 0.

A fit rate <5fit (T=55°C, S=60%) is guaranteed. A typical fit rate of the semiconductor technology used is 2.5fit.

7 Customization

For high-volume applications that require an upgraded or downgraded functionality compared to the ZSSC3136, IDT can customize the circuit design by adding or removing certain functional blocks.

Please contact IDT for further information.

8 Ordering Information

Product Sales Code	Description	Package
ZSSC3136BA2T	ZSSC3136 SSOP14 – temperature range -40 to +125 °C	Tube
