

32-Bit Traveo™ Family Microcontroller Datasheet

This section provides an overview of the S6J3120 series. The S6J3120 series is a set of 32-bit microcontrollers designed for in-vehicle use. It uses the Arm® Cortex®-R5 CPU as a CPU.

Features

This section explains the features of the S6J3120 series.

Cortex-R5 Core

■ This section explains the Cortex-R5 CPU core.

- Arm Cortex-R5
- 32-bit Arm architecture
 - 2-instruction issuance super scalar
 - 8-stage pipeline
- Armv7/Thumb®-2 instruction set
- MPU (memory protection) equipped
 - 16-area support
- ECC support for the TCM ports for RAM
 - 1-bit error correction and 2-bit error detection (SEC-DED)
- TCM ports
 - 2 TCM ports
 - ATCM port
 - B1TCM port (B0TCM, B1TCM)
- Caches
 - Instruction cache 16 KB
 - Data cache 16 KB
- VIC port
 - Low latency interrupt
- AXI master interface
 - 64-bit AXI interface (instruction/data access)
 - 32-bit AXI interface (I/O access)
- AXI slave interface
 - 64-bit AXI interface (TCM port access)
- ETM-R5 trace

Peripheral Functions

This section explains peripheral functions.

- Clock generation
 - Main clock oscillation (4 MHz)
 - No sub clock oscillation
 - CR oscillation (100 kHz)
 - CR oscillation (4 MHz)
- Built-in Flash memory size
 - Program: 1024 K + 64 KB (S6J312AHzC*)/768 K + 64 KB (S6J3129HzC*)
 - *z: A/B
 - Work: 112 KB (S6J312AHzC*)/ 112 KB (S6J3129HzC*)
 - *z: A/B

- Built-in RAM size
 - TCRAM 64 KB(S6J312AHzC*)/ 48 KB(S6J3129HzC*)
 - System SRAM 16 KB (S6J312AHzC*)/ 16 KB (S6J3129HzC*)
 - Backup RAM 8 KB (S6J312AHzC*)/ 8 KB (S6J3129HzC*)
 - *z: A/B
- General-purpose ports: 112 channels (S6J312AHzC*)/ 112 channels (S6J3129HzC*)
 - *z: A/B
- External bus interface
 - 24-bit address, 16-bit data
- DMA controller
 - Up to 16 channels can be activated simultaneously.
- A/D converter (successive approximation type)
 - 12-bit resolution, 2 units mounted: Max 50 channels (22 channels + 28 channels)(S6J312AHzC*)/ Max 50 channels (22 channels + 28 channels)(S6J3129HzC*)
 - *z: A/B
- External interrupt input: 16 channels
 - Level ("H"/"L") and edge (rising/falling) can be detected.
- Multi-function serial (transmission and reception FIFOs mounted) :Max 10 channels(S6J312AHzC*)/ Max 10 channels(S6J3129HzC*)
 - *z: A/B
 - <I²C>
 - Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
 - Standard mode (Max. 100 kbps) is supported only.
 - DMA transfer is supported.
 - <UART (asynchronous serial interface) >
 - Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
 - Parity check can be enabled/disabled.
 - Built-in dedicated baud rate generator
 - An external clock can be used as a transfer clock.
 - Parity, frame, overrun error detection functions are available.
 - DMA transfer is supported.
 - <CSIO (synchronous serial interface) >
 - Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
 - Support for SPI. Both master and slave roles are supported. Data length in bits can be set to a value from 5 to 16 or one of the values of 20, 24, and 32.
 - Built-in dedicated baud rate generator (master operation)
 - External clock input is enabled (slave operation).

- Overrun error detection function is available.
- DMA transfer is supported.
- Serial chip select SPI function
 - <LIN-UART (asynchronous serial interface for LIN) >
 - Full duplex, double buffering system; 64-byte transmission FIFO, 64-byte reception FIFO
 - Support for LIN protocol revision 2.1
 - Both master and slave roles are supported.
 - Framing error and overrun error detection
 - LIN Synch break generation and detection, LIN Synch Delimiter generation
 - Built-in dedicated baud rate generator
 - The external clock can be adjusted by the reload counter.
 - DMA transfer is supported.
- CAN controller: CAN-FD Max 3 channel
 - CAN-FD (V3.2.0)
 - CAN transfer speed :5 Mbps
 - CAN Clock :Max 40 MHz
 - 192 message buffers/channel (reception message buffer size)
 - 32 message buffer/channel (transmission message buffer size)
- Base timer: MAX 30 channels
 - 16-bit Timer.
 - It is selectable by 4 functions of the PWM/PPG/PWC/Reload Timer.
 - 2-channel cascade connection enables operation as a 32-bit timer.(PWC and Reload Timer)
- Reload timer: Max 10 channels
 - 32-bit Timer.
- Free-run timer: Max 6 channels
 - 32-bit Timer.
 - Main clock oscillation and CR oscillation are available.
 - Free-run timer output can work in combination with an input capture and an output compare.
- Input capture: Max 12 channels
 - 32-bit Timer.
- Output compare: Max 12 channels
 - 32-bit Timer.
- Sound generator : Max 3 channels
 - Frequency and amplitude sequencers provided.
- Stepping motor controller : Max 4 channels
 - 8-/10-bit PWM
 - High current output supported (4 lines × 4 channels)
 - Can refer back electromotive force using pin-shared A/D converter
- LCD controller
 - Common output : 4 , Segment output : 32
 - Duty drive (SEG0 to SEG31) and static drive (ST0 to ST8) can be switched.
 - Each of COM0 to COM3, SEG0 to SEG31, V0, V1, V2, and V3 pins for duty drive can be switched to the general-purpose port. (The SEG23 to SEG31 pins can be switched to static driving.)
 - V0, V1, V2 and V3 pin can be used as the general-purpose port. But V3 pin cannot be used as an output pin.
- Each of ST0 to ST8 pins for static drive can be switched to the general-purpose port, or it can be switched to the segment output of duty drive.
- Quad position & revolution counter(QPRC) : Max 2 channels
- Real time clock (RTC) (day/hour/minute/second)
 - Main clock oscillation or CR oscillation (100 kHz) can be selected as an operation clock.
- Calibration: Real time clock (RTC) driven by the CR clock
 - Correction can be done by configuring the prescaler of the real time clock based on the ratio between the main clock and the CR clock.
- Clock supervisor
 - Abnormality (such as damaged crystal) of the main clock oscillation (4 MHz) can be monitored.
 - The clock can switch to the CR clock when an abnormality is detected.
 - PLL abnormality can be detected.
- CRC generation
 - Fixed-length CRC
 - CCITT CRC16 generator polynomial: 0x1021
 - IEEE-802.3 CRC32 generator polynomial: 0x04C11DB7
- DDR HS-SPI
 - E²PROM and the flash device of the Single/Dual/Quad-SPI protocol can be connected.
- Watchdog timer
 - Hardware watchdog
 - Software watchdog
- NMI
- I/O relocation
 - Peripheral function pin locations can be changed.
- Low-power consumption control
 - Standby function
 - Power-off function
 - Partial wakeup function
- Power-on reset
- Low-voltage detection reset
- Security
 - Flash security
 - Interface security (JTAG + test port)
 - SHE
 - Unique device ID
- Package: LEU144 (S6J312xHzC*)
 - *x:A/9, z: A/B
- CMOS 55 nm technology
- Power supply
 - 5 V single power supply
 - The voltage step-down circuit generates internal 1.2 V from 5 V.
 - 5 V power supply is used for I/O.

Table of Contents

Features	1	10.7 Trigger Input Timing	89

10.5 Timer Input Timing	85	Sales, Solutions, and Legal Information	116
10.6 QPRC Timing.....	86		

1. Product Lineup

The following table lists the product lineup of the S6J3120 series.

Table 1-1 Memory Size

		S6J312AHzC*	S6J3129HzC*
Flash	Program	1024 KBytes + Small sector (8 KB x 8)	768 KBytes + Small sector (8 KB x 8)
	Work	112 KBytes	112 KBytes
RAM	TCRAM	64 KBytes	48 KBytes
	System SRAM	16 KBytes	16 KBytes
	Backup RAM	8 KBytes	8 KBytes

*z: A/B

Table 1-2 SHE Option

	S6J312xHAC*	S6J312xHBC*
Security (SHE)	ON	OFF

* x: A/9

Table 1-3: Product Lineup

	S6J312xHzC*¹
CPU core	Coretex-R5
CMOS 55 nm technology	55 nm
Package	LEU144
Main clock	4 MHz
Built-in CR oscillator	100 kHz
	4 MHz
Maximum CPU operating frequency	128 MHz
Watchdog timer	1 channel (hardware) 1 channel (software)
Clock supervisor	YES
External power supply, low-voltage detection reset	YES
Internal power supply, low-voltage detection reset	YES
NMI request	YES
External interrupt	16 channels
DMA controller	16 channels
CAN-FD	3 channels (192 msg buffers/ch)
Multi-function serial	10 channels* ²
A/D converter	12-bit (2 units) Unit 0 x 22 channels Unit 1 x 28 channels
Free-run timer	6 channels
Input capture	12 channels
Output compare	12 channels

	S6J312xHzC*1
Base timer (16-bit)	30 channels
Real time clock (RTC)	1 channel
CR clock calibration	YES
CRC generation	YES
Low-power consumption mode	Standby function Power-off function Partial wakeup function
SHE	YES
External BUS I/F	Address : 24-bit Data :16-bit
Reload Timer(32-bit)	10 channels
Quad Position & Revolution Counter	2 channels
DDR HS-SPI	YES
LCD Controller	32 seg x 4 com (Static drive 8 seg x 1 com)
Sound Generator	3 channels
Stepping Motor Controller	4 channels
General-purpose port GPIO	112 channels
Power supply	5 V ± 10 %
Operation assurance temperature (Ta)	-40 °C to +105 °C
On-chip debugger (JTAG)	YES

*1: x: A/9, z: A/B

*2: I²C-UART function is not supported at Multi-function serial ch.1, ch.2, and ch.12.

2. Pin Assignment

The following figures show the pin assignment of the S6J3120 series.

Figure 2-1 Pin Assignment for S6J312xHzC*

* x: A/9, z: A/B

3. Pin Description

This section provides a list of the pin functions of the S6J3120 series

Table 3-1 S6J312xHzC* Pin Functions

* x: A/9, z: A/B

Pin No.	Pin Name	Polarity	I/O Circuit Type	Function

4. I/O Circuit Types

This section explains I/O circuit types.

Type	Circuit	Overview
A	 <p> Pull-up control Digital output Digital output Pull-down control CMOS input PSS control Analog input </p>	<ul style="list-style-type: none"> - General-purpose I/O port with analog input - Output of 1 mA or 2 mA selectable - 50 kΩ with pull-up resistor control - 50 kΩ with pull-down resistor control - CMOS hysteresis input
B	 <p> Pull-up control Digital output Digital output Pull-down control Automotive/ CMOS input PSS control Analog input </p>	<ul style="list-style-type: none"> - General-purpose I/O port with analog input - Output of 1 mA or 2 mA selectable - 50 kΩ with pull-up resistor control - 50 kΩ with pull-down resistor control - Automotive/CMOS hysteresis input selectable
C	 <p>Mode input</p>	<ul style="list-style-type: none"> - Mode input - CMOS hysteresis input
D	 <p> Pull-up control Digital output Digital output TTL input </p>	<ul style="list-style-type: none"> - JTAG - General-purpose output port - Output of 2 mA - 50 kΩ with pull-up resistor control - TTL input

Type	Circuit	Overview
E		<ul style="list-style-type: none"> - JTAG - 50 kΩ with pull-up resistor control - TTL input
F		<ul style="list-style-type: none"> - CMOS hysteresis input - 50 kΩ with pull-up resistor
G		<ul style="list-style-type: none"> - Main oscillation I/O
I		<ul style="list-style-type: none"> - JTAG - Output of 2 mA
J		<ul style="list-style-type: none"> - JTAG - General-purpose output port - Output of 2 mA - 50 kΩ with pull-down resistor control - TTL input

Type	Circuit	Overview
K	 <p> Pull-up control Digital output Digital output Pull-down control Automotive/CMOS input PSS control COM/SEG output </p>	<ul style="list-style-type: none"> - General-purpose I/O port with COM/SEG output - Output of 1 mA or 2 mA selectable - 50 kΩ with pull-up resistor control - 50 kΩ with pull-down resistor control - Automotive/CMOS hysteresis input selectable
L	 <p> Pull-up control Pull-down control Automotive/CMOS input PSS control LCDC V3 input </p>	<ul style="list-style-type: none"> - General-purpose I/O port with LCDC V3 input - 50 kΩ with pull-up resistor control - 50 kΩ with pull-down resistor control - Automotive/CMOS hysteresis input selectable
M	 <p> Pull-up control Digital output Digital output Pull-down control Automotive/CMOS input PSS control Analog input </p>	<ul style="list-style-type: none"> - General-purpose I/O port with analog input - Output of 1 mA or 2 mA or 30 mA selectable - 50 kΩ with pull-up resistor control - 50 kΩ with pull-down resistor control - Automotive/CMOS hysteresis input selectable
Q	 <p> Pull-up control Digital output Digital output Pull-down control Automotive/CMOS input PSS control </p>	<ul style="list-style-type: none"> - General-purpose I/O port - Output of 1 mA or 2 mA selectable - 50 kΩ with pull-up resistor control - 50 kΩ with pull-down resistor control - Automotive/CMOS hysteresis input selectable

Type	Circuit	Overview
R		<ul style="list-style-type: none"> - Output of 2 mA

5. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

5.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

Latch-Up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

5.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product.
Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70 % relative humidity, and at temperatures between 5 °C and 30 °C.
When you open Dry Package that recommends humidity 40 % to 70 % relative humidity.
- (3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125 °C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40 % and 70 %.
Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

5.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

- (1) Humidity
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
- (2) Discharge of Static Electricity
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
- (3) Corrosive Gases, Dust, or Oil
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
- (4) Radiation, Including Cosmic Radiation
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
- (5) Smoke, Flame
CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

6. Handling Devices

For Latch-Up Prevention

The latch-up phenomenon may occur on a CMOS IC in the following cases: the voltage applied to an input or output pin is higher than V_{CC} or lower than V_{SS} ; or the voltage applied between a V_{CC} pin and a V_{SS} pin exceeds the rating. A latch-up causes a rapid increase in the power supply current, possibly resulting in thermal damage to an element. When using the device, take sufficient care not to exceed the maximum rating.

Also be careful that analog power supplies ($AVCC0$, $AVCC1$, $AVRH0$, and $AVRH1$) and analog inputs do not exceed the digital power supply (V_{CC}) at the analog system power-on and power-off times. V_{CC} and DV_{CC} must be set to the same voltage. The power-on sequence is as follows. Simultaneously turn on the digital supply voltage (V_{CC}) and analog supply voltages ($AVCC0$, $AVCC1$, $AVRH0$, and $AVRH1$), and the power supply voltage of high-current output buffer pins (DV_{CC}), or turn on the digital supply voltage (V_{CC}) and then the analog supply voltages ($AVCC0$, $AVCC1$, $AVRH0$, and $AVRH1$), and the power supply voltage of high-current output buffer pins (DV_{CC}).

About Handling Unused Pins

Leaving unused input pins open may cause permanent damage from a malfunction or latch-up. Take measures for unused pins, such as pulling up or pulling down the voltage with resistors of 2 kilohms or higher.

If there are any unused input/output pins, set them to the output state and then open them, or set them to the input state and handle them in the same way as input pins.

About Power Supply Pins

If the device has multiple V_{CC} and V_{SS} pins, the device is designed in such a way that the pins that should be at the same potential are connected to each other inside the device to prevent malfunctions such as latch-up. However, to reduce unwanted emissions, prevent malfunctions of strobe signals caused by an increase of the ground level, and observe standards on total output current, be sure to connect all the V_{CC} and V_{SS} pins to the power source and ground externally. Also handle all the V_{SS} power supply pins in this way as shown in the following diagram. If there are multiple V_{CC} or V_{SS} systems, the device does not operate normally even within the guaranteed operating range.

Figure 6-1 Pin Assignment

In addition, consider connecting with low impedance from the power supply source to the V_{CC} and V_{SS} of this device.

In the area close to this device, a ceramic capacitor having the capacitance larger than the capacitor of C pin is recommended to use as a bypass capacitor between the V_{CC} pin and the V_{SS} pin.

About the Crystal Oscillation Circuit

Noise entering the X0 or X1 pin may cause a malfunction. Design the printed circuit board in such a way that the X0 and X1 pins, the crystal oscillator (or ceramic resonator), and a bypass capacitor to ground are located very close to the device.

We recommend that the printed circuit board artwork have the X0 and X1 pins enclosed by ground.

About the Mode Pin (MD)

Use mode pin MD by directly connecting it to a VCC or VSS pin. To prevent noise from causing the device to accidentally enter test mode, reduce the pattern length between each mode pin and a VCC or VSS pin on the printed circuit board, and connect them with low impedance.

About the Power-on Time

To prevent a malfunction of the voltage step-down circuit built in the device, the voltage rising must be monotonic during power-on

Point to Note during PLL Clock Operation

While a PLL clock is selected, if the oscillator breaks off or input stops, the PLL clock may continue operating with the free running frequency of the internal self-oscillator circuit. This operation is outside of the guaranteed range.

Power Supply Pin Processing of an A/D Converter

Even when no A/D converter is used, establish a connection such that $AVCC = AVRH = VCC$ and $AVSS = AVSS/AVRL = VSS$.

Points to Note About Using External Clocks

External clocks are not supported.

External direct clock input cannot be used.

Power-on Sequence of the Power Supply Analog Inputs of an A/D Converter

Be sure to turn on the digital power supply (VCC) before the application of the power supplies (AVCC, AVRH, and AVRL) and analog inputs (AN3, AN5 to AN6, AN9 to AN10, AN12 to AN15, AN17 to AN24, AN27 to AN43, AN46 to AN53, and AN55 to AN62) of an A/D converter.

At the power-off time, turn off the power supplies and analog inputs of the A/D converter, and then turn off the digital power supply (VCC). Perform these power-on and power-off operations without AVRH exceeding AVCC. Even when using a pin shared with an analog input as an input port, do not allow the input voltage to exceed AVCC. (Turning on or off the analog supply voltage and digital supply voltage simultaneously is not a problem.)

Treatment of Power supplies for High Current Output Buffer Pins (DVCC, DVSS)

Be sure to turn on the digital power supply voltage (VCC) first, and then turn on the power supply voltage for high current output buffer pins (DVCC, DVSS). Also, turn off the power supplies for high current output buffer pins first, and then turn off the digital power supply voltage (VCC).

Even if the high current output buffer pins are used as general-purpose ports, the power supply voltage of high current output buffer pins (DVCC, DVSS) must be powered. (The power supplies of high current output buffer pins and the digital power supplies can be turned on or off simultaneously.)

Connect the pins to have $DVCC = VCC$ and $DVSS = VSS$.

About C Pin Processing

This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin (pin 126 in S6J312xHzC* specifications) for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet.

*x:A/9, z: A/B

Precautions on Designing a Mounting Substrate

Measures against heat generation from the package must be taken for the mounting substrate to observe the absolute maximum rating (operating temperature). Design a mounting substrate with 4 or more layers. Connect the back of the package stage and the substrate pad with solder paste. Arrange thermal via holes on the substrate pad. For detailed information about mount conditions, contact your sales representative.

Notes on Writing to a Register Containing a Status Flag

In writing to a register containing a status flag (particularly an interrupt request flag, etc.) to control a function, it is important to take care not to accidentally clear the status flag.

Therefore, before the write operation, configure the status bit such that the flag is not cleared, and then set the control bit to the desired value.

Especially for control bits configured as a set of multiple bits, bit instructions cannot be used (bit instructions have only 1-bit access). In such cases, byte, half-word, or word access is used to write to the control bits and a status flag simultaneously. However, at this time, be careful not to accidentally clear bits other than the intended ones (the status flag bit in this case).

Note: Bit instructions take this point into account for registers that support bit-band units, so it does not need to be a concern. You need to take care when using bit instructions for registers that do not support bit-band units.

7. Block Diagram

This section provides block diagrams of the S6J3120 series.

- Only the CPU core can access 0000_0000 ~ 01FF_FFFF. Bus masters other than the CPU core cannot access the region.
- Internal area of CR5 complex (0000_0000 ~ 01FF_FFFF) is mapped to AXI_SLAVE_CORE0. All bus masters can access to internal area of CR5 complex via AXI_SLAVE_CORE0.
- In each of the following memory area combinations, the areas are physically the same memory area.
 1. TCM FLASH (0x00A0_0000 -) and AXI FLASH MEMORY (0x01A0_0000 -)
 2. TCM FLASH Small Sector (0x009F_0000 -) and AXI FLASH MEMORY Small Sector (0x019F_0000 -)
 3. WORKFLASH (0x0E00_0000 -), WORKFLASH (0x0E20_0000 -), and WORKFLASH (0x0E30_0000 -)

The ECC movement in TCM port is based on ECC setting inside the CPU.

- The differences between the TCM FLASH and AXI FLASH include the following.

Function	TCM FLASH	AXI FLASH
High-speed Access Using Dedicated Bus	Applicable	Not applicable
Write and Erase	Not applicable (Read-only)	Applicable
Read	Applicable	Applicable

- The differences between WORKFLASH areas include the following.

Area	Function
WORKFLASH Area 1	Used in write operation (with ECC)
WORKFLASH Area 3	Used in write operation (without ECC)
WORKFLASH Area 4	Used in read operation

- Terms are as follows.

Term	Description
TCM RAM	Main RAM
TCM FLASH	Program FLASH (TCM area)
AXI FLASH	Program FLASH (AXI area) This is physically the same as the TCM FLASH.
SYSTEM RAM	System RAM
AXI SLAVE CORE	AXI CPU control area
WORKFLASH	FLASH for work
BACKUP RAM	Backup RAM
EBI MEMORY	Memory for External bus interface
HSSPI0 MEMORY	Memory for DDR HS-SPI
Peri area	Entire area for peripheral functions
APPS#5	Part of area for peripheral functions
APPS#7	Part of area for peripheral functions
ERRCFG	Error configuration area
BootROM	ROM for reset boot

When MPU attribute of Cortex®-R5 is configured as "Normal", store buffer inside Cortex®-R5 can operate and write data can be merged. To avoid influence of this data merger, MPU attribute "Device" or "Strongly Ordered" should be used.

MPU attribute "Device" or "Strongly Ordered" must be used for areas below, to avoid this influence.

- Backup RAM area (BACKUP_RAM) [0E80_0000 ~ 0E87_FFFF]
- Peripheral area (Peri area) [B000_0000 ~ B7FF_FFFF]
- Error Config area (ERRCFG) [FFFE_E000 ~ FFFE_FFFF]

MPU attribute "Device" or "Strongly Ordered" is required for accesses to areas below, in particular situation.

- FLASH Memory (when writing commands)

SHE OFF product is prohibited to access SHE area (B200_0000 to B20F_FFFF)

9. Pin Statuses In CPU Status

Table 9-1 Pin State Table (1/2)

Pin No.	Pin Name	GPORTEN Control	External Reset Factor 1			External Reset Factor 2			External Reset Factor 3	Internal Reset Factor #2	Sleep mode	Stop mode #4		Timer mode #4				
			External factor generation in progress	After external factor releasing	After internal reset issuance before GPORT setting	External factor generation in progress	After external factor releasing	After internal reset issuance before GPORT setting				Internal reset in progress	After internal reset issuance before GPORT setting	CPU Sleep mode	High impedance (SYSIO_SPECIFR_PSSPACTRL=0)	When High Impedance Enabled (SYSIO_SPECIFR_PSSPACTRL=1)	High impedance (SYSIO_SPECIFR_PSSPACTRL=0)	When High Impedance Enabled (SYSIO_SPECIFR_PSSPACTRL=1)
			Internal reset issuance in progress	Internal reset issuance in progress	Before internal reset issuance	Internal reset issuance in progress	Internal reset issuance in progress	Before internal reset issuance				Internal reset in progress	After internal reset issuance before GPORT setting	Internal reset in progress	High impedance (SYSIO_SPECIFR_PSSPACTRL=0)	When High Impedance Enabled (SYSIO_SPECIFR_PSSPACTRL=1)	High impedance (SYSIO_SPECIFR_PSSPACTRL=0)	When High Impedance Enabled (SYSIO_SPECIFR_PSSPACTRL=1)

- *1: Input disable is not valid when external interrupts are enabled.
- *2: Recovery from standby (power off) becomes a factor.
- *3: The pin state from the time that HOLDIO_PD2 was set (SYSC0_SPECIFGR.HOLDIO_PD2 = 1) is retained. If power-off has not occurred and HOLDIO_PD2 has not been set (SYSC0_SPECIFGR.HOLDIO_PD2 = 0), the last state is retained.
- *4: To power off power domains 2 and 3, be sure to set HOLDIO_PD2 (SYSC0_SPECIFGR.HOLDIO_PD2 = 1).
- *5: The pin state when the PORT function is enabled is shown.
- *6: When Port is used as LCD setting, PIN state becomes the following.

Power Domain 2 Control	Power-Off	Power-on		
		Except PSS Main oscillation Timer mode	PSS Main oscillation Timer mode	
mode	-	Except PSS Main oscillation Timer mode	PSS Main oscillation Timer mode	
Main oscillation enable setting	-	-	enable (LCR0:LCEN = 1)	disable (LCR0:LCEN = 0)
PIN state	Output "L" / Input blocked	Output "L" / Input blocked	Retention of LCD display	Output "L" / Input blocked

- *7: When the PWU function is enabled, a change to output occurs.
- *8: When PPC_PCFGR_{ijj}:POF[2:0] is set to initial value.
- *9: When reset is issued, the following ports become "L" output as the initial state.

- P019, P023, P024, P027, P028, P029, P030, P031, P100, P406, P407, P408, P409

Therefore, don't add the Pull-up registers outside of this product to the above ports.

In case that the above ports are used as Pull-up, use the Pull-up function implemented in this product.

-External Reset Factor 1

- Power-on reset (PONR)
- RAM retention low-voltage detection reset (RVD)
- Internal power supply low-voltage detection reset (LVDL1R)
- RSTX pin + MD pin simultaneous assert reset (INITX)

-External Reset Factor 2

RSTX pin input reset (RSTX)

-External Reset Factor 3

- Hardware watchdog reset (HWDR)
- Software watchdog reset (SWDR)
- PLL clock supervisor reset (CSVPRn)
- SSCG clock supervisor reset (CSVSRn)
- Profile error reset (PRFERR)
- Software trigger hard reset (SHRST)
- Software reset (SRST)

-Internal Reset Factor

Standby transition reset/ Power domain reset

10. Electrical Characteristics

10.1 Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage ^{*1, *2}	V _{CC}	V _{SS} -0.3	V _{SS} +6.0	V	
	DV _{CC}	V _{SS} -0.3	V _{SS} +6.0	V	DV _{CC} = V _{CC}
Analog supply voltage ^{*1, *2}	AV _{CC}	V _{SS} -0.3	V _{SS} +6.0	V	AV _{CC} = V _{CC}
Analog reference voltage ^{*1}	AVRH	V _{SS} -0.3	V _{SS} +6.0	V	AVRH ≤ AV _{CC}
Input voltage ^{*1}	V _{I1}	V _{SS} -0.3	V _{CC} +0.3	V	
	V _{I2}	DV _{SS} -0.3	DV _{CC} +0.3	V	SMC shared pin
Analog pin input voltage ^{*1}	V _{IA1}	V _{SS} -0.3	V _{CC} +0.3	V	
	V _{IA2}	DV _{SS} -0.3	DV _{CC} +0.3	V	SMC shared pin
Output voltage ^{*1}	V _{O1}	V _{SS} -0.3	V _{CC} +0.3	V	
	V _{O2}	DV _{SS} -0.3	DV _{CC} +0.3	V	SMC shared pin
Maximum clamp current	I _{CLAMP}	-	4	mA	*8
Total maximum clamp current	Σ I _{CLAMP}	-	20	mA	*8
"L"-level maximum output current ^{*3}	I _{OL1}	-	3.5	mA	When setting is 1 mA ^{*6}
	I _{OL2}	-	7	mA	When setting is 2 mA

"L"-level average output current ^{*4}	I _{OLAV1}	-	1	mA	When setting is 1 mA ^{*6}
	I _{OLAV2}	-	2	mA	When setting is 2 mA
	I _{OLAV3}	-	30	mA	When setting is 30 mA ^{*7}
"L"-level total output current ^{*5}	ΣI _{OL1}	-	40	mA	*6
	ΣI _{OL2}	-	150	mA	*7
"H"-level maximum output current ^{*3}	I _{OH1}	-	-3.5	mA	When setting is 1 mA ^{*6}
	I _{OH2}	-	-7	mA	When setting is 2 mA
	I _{OH3}	-	-40	mA	When setting is 30 mA ^{*7}
"H"-level average output current ^{*4}	I _{OHAV1}	-	-1	mA	When setting is 1 mA ^{*6}
	I _{OHAV2}	-	-2	mA	When setting is 2 mA
	I _{OHAV3}	-	-30	mA	When setting is 30 mA ^{*7}
"H"-level total output current ^{*5}	ΣI _{OH1}	-	-40	mA	*6
	ΣI _{OH2}	-	-150	mA	*7
Power consumption	P _D	-	2000	mW	S6J312xHzC ^{*9}
Operating temperature	T _A	-40	+105	°C	
Storage temperature	T _{stg}	-55	+150	°C	

*1: These parameters are based on the condition that V_{SS} = DV_{SS} = AV_{SS} = 0.0 V.

*2: AV_{CC}, DV_{CC} and V_{CC} must be set to the same voltage. It is required that AV_{CC} and DV_{CC} do not exceed V_{CC} and that the voltage at the analog inputs does not exceed AV_{CC} when the power is switched on.

*3: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

*4: The average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current X the operation ratio.

*5: The total output current is defined as the maximum current value flowing through all of corresponding pins.

*6: Corresponding pins: general-purpose ports

*7: Corresponding pins: P229 to P231, P300 to P302, P304 to P305, P307 to P309, P312 to P315, P317

*8: Corresponding pins: All general-purpose ports and analog input pins.

- Use the device within the recommended operating conditions.
- Use the device with direct voltage (current).
- The + B signal should always be applied by connecting a limiting resistor between the + B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the + B signal is input.
- Note that when the microcontroller drive current is low, such as in the low-power consumption modes, the + B input potential can increase the potential at the VCC pin via a protective diode, possibly affecting other devices.
- Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave + B input pins open.

*9: It is standard when four-layer substrate is used.

Example of a recommended circuit

WARNING:

- Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

10.2 Recommended Operating Conditions

(V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Supply voltage	V _{CC}	4.5	5.5	V	Recommended operation assurance range
	DV _{CC}	4.5	5.5	V	
	AV _{CC}	4.5	5.5	V	
	V _{CC}	3.5	5.5	V	Operation assurance range
	DV _{CC}	3.5	5.5	V	
	AV _{CC}	3.5	5.5	V	
Smoothing capacitor*	C _{S1}	4.7		μF	Tolerance of up to ±40 %, 126 pin Use a ceramic capacitor or a capacitor that has the similar frequency characteristics. Use a capacitor with a capacitance greater than CS as the smoothing capacitor on the VCC pin.
Operating temperature	T _A	-40	+105	°C	S6J312xHzC* * x:A/9, z:A/B

*: For the connections of smoothing capacitor C_{S1}, see the following diagram.

WARNING:

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

Notes:

- The following condition should be satisfied in order to facilitate heat dissipation.
 1. 4 or more layers PCB should be used.
 2. The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard)
 3. 1 layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90 % or more. The layer can be used for system ground.
 4. 35~50 % of the die stage area which is exposed at back surface of package should be soldered to a part of 1st layer.
 5. The part of 1st layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes.

Figure10.2-1: Example thermal via holes on PCB.

Notes:

- Figure 10.2-1 is a schematic diagram showing PCB in section.
- Figure 10.2-2 in the following pages are recommended land patterns for each package series. Thermal via holes should closely be placed and aligned with lands.
- If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

Figure 10.2-2: Land Pattern and Thermal Via LEU144

10.3 DC Characteristics

(T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks

- Guaranteed operation range

Internal operation clock frequency vs. Power supply voltage

Note: A supply voltage that is equal to or less than the set voltage for low-voltage detection causes a reset.

Relationship between the oscillation clock frequency and internal clock frequency

Oscillation Clock Frequency	Main Clock	PLL Multiplier Setting	PLL Output Division Setting	PLL Clock
4 MHz	4 MHz	128	4	128 MHz
4 MHz	4 MHz	120	6	80 MHz

- Oscillation circuit example

Notes:

- When configuring the oscillator circuit, it is recommended to ask matching evaluation of the circuit to oscillator manufacturers for the design.
- The maximum PLL clock frequency must be 128MHz.
 Output division configuration can be set by the following.
 - PLLDIVM bit in SYSC0_RUNPLL0CNTR register
 - PLLDIVM bit in SYSC0_PSSPLL0CNTR register
 - SSCGDIVM bit in SYSC0_RUNSSCG0CNTR0 register
 - SSCGDIVM bit in SYSC0_PSSSSCG0CNTR0 register
 (e.g. If PLLout is 448 MHz, these settings must be configured as "multiply by 4" and over multiplication setting)

AC characteristics are specified by the following measurement reference voltage values.

10.4.3 Reset Input

(T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Reset input time	t _{RSTL}	RSTX	-	10	-	μs	
Width for reset input removal				1	-	μs	

10.4.4 Power-on Conditions

(T_A: Recommended operating conditions, V_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Level detection voltage	-	VCC	-	2.15	2.35	2.55	V	
Level detection hysteresis width	-	VCC	-	-	100	-	mV	
Level detection time	-	-	-	-	-	540	μs	*1
Level release voltage	-	VCC	-	2.25	2.45	2.65	V	
Power off time	-	VCC	-	1	-	-	ms	*2
Power ramp rate	dV/dt	VCC	VCC: 0.2 V to 2.55 V	-	-	6	mV/μs	*3
Maximum ramp rate guaranteed to not generate power-on reset	dV/dt	VCC	VCC: Between 2.6 V and 4.5 V	-	-	50	mV/μs	*4

*1: If a power fluctuation precedes the low-voltage detection time, the detection may occur or be canceled after the supply voltage passes the detection voltage range.

*2: If VCC is held below 0.2 V for a minimum period of t_{OFF}, power-on reset will occur. If t_{OFF} is not satisfied, power-on reset will still occur if the power ramp rate is kept below 6 mV/μs.

*3: This is the power ramp rate with which power-on reset will always occur regardless of power-off time, as mentioned in *2.

*4: When VCC is within 2.6 V - 4.5 V, and VCC fluctuation is below 50 mV/μs, the power-on reset is suppressed. Between 4.5 V - 5.5 V, the power-on reset does not occur with any VCC fluctuation.

Note:

When neither *2 nor *3 can be satisfied, assert external reset (RSTX) at power-up and at any brownout event.

10.4.5 Clock Output Timing

(T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)
 (External load capacitance 16 pF)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Cycle time	t _{CYC}	MCLK	2 mA is selected in ODR bit in PPC_PCFGR register.	40	-	ns	
Clock high width ^{*1}	t _{CHCL}	MCLK		d _H t _{CYC} - 7	d _H t _{CYC} + 7	ns	
Clock low width ^{*2}	t _{CLCH}	MCLK		d _L t _{CYC} - 7	d _L t _{CYC} + 7	ns	

*1: If division-ratio is even value, d_H is equivalent to 0.5.

Otherwise, d_H is calculated as the following.

d_H = The number rounding "division-ratio x 0.5" down to the nearest integer / division-ratio

division-ratio is multiplication value among SYSDIV bit, HPMDIV bit and EXTBUSDIV bit setting.

ex). Setting SYSDIV to 1-division, HPMDIV to 7-division, EXTBUSDIV to 1-division, d_H is calculated as 0.429.

*2: If division-ratio is even value, d_L is equivalent to 0.5.

Otherwise, d_L is calculated as the following.

d_L = The number rounding "division-ratio x 0.5" up to the nearest integer / division-ratio

division-ratio is multiplication value among SYSDIV bit, HPMDIV bit and EXTBUSDIV bit setting.

ex). Setting SYSDIV to 1-division, HPMDIV to 7-division, EXTBUSDIV to 1-division, d_L is calculated as 0.571.

10.4.6 External Bus Interface Timing

10.4.6.1 Common Timing Between Read and Write

(TA: Recommended operating conditions, Vcc = DVcc = 5.0 V ±10 %, Vss = DVss = AVss = 0.0 V)

(External load capacitance 16 pF)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Cycle time (without MRDY)	t_{CYC}	MCLK	2 mA is selected in ODR bit in PPC_PCFGFR register.	40	-	ns	
Cycle time (with MRDY)	t_{CYC}	MCLK		50	-	ns	If using MRDY, set MCLK to 20 MHz or less.
CS delay time	t_{CSO}	MCLK, MCSX0 to MCSX3		0.5	18	ns	
Address delay time	t_{AO}	MCLK, MAD00 to MAD23		0.5	18	ns	
RDY setup time	t_{RDYS}	MCLK, MRDY	"CMOS Schmitt input" and "Disable noise filter" are selected in PPC_PCFGFR register.	21	-	ns	
RDY hold time	t_{RDYH}	MCLK, MRDY		0	-	ns	

10.4.6.2 Read Timing

(T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)
 (External load capacitance 16 pF)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Data setup time	t _{DSR}	MOEX, MDATA00 to MDATA15	"CMOS Schmitt input" and "Disable noise filter" are selected in PPC_PCFGR register.	21+t _{cyc}	-	ns	
Data hold time	t _{DHR}	MOEX, MDATA00 to MDATA15		0	-	ns	
MOEX delay time	t _{RDO}	MCLK, MOEX	2 mA is selected in ODR bit in PPC_PCFGR register.	0.5	18	ns	

10.4.6.3 Write Timing

(T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)
 (External load capacitance 16 pF)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
MWEX delay time	t _{WEO}	MCLK, MWEX	2 mA is selected in ODR bit in PPC_PCFGR register.	0.5	18	ns	
Byte mask delay time	t _{WRO}	MCLK, MDQM0 to MDQM1		0.5	18	ns	
Data delay time	t _{DO}	MCLK, MDATA00 to MDATA15		0.5	18	ns	
Data delay time (Hi-Z output)	t _{DOZ}	MCLK, MDATA00 to MDATA15		-	18	ns

10.7 Trigger Input Timing

(T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Input pulse width	t _{TRGH}	INT0 to INT15	-	100	-	ns	
	t _{TRGL}	INT0 to INT15	-	1	-	µs	Stop mode

10.8 NMI Input Timing

(T_A: Recommended operating conditions, V_{CC} = 5.0 V ±10 %, V_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Input pulse width	t _{NMIL}	NMIX	-	300	-	ns	

10.9 Low-Voltage Detection (External Low-Voltage Detection)

 (TA: Recommended operating conditions, V_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Power supply voltage range	V _{DP5}	VCC	-	3.5	-	5.5	V	
Detection voltage	V _{DL0}	VCC	*1 *3	3.6	3.8	4.0	V	When power-supply voltage falls and detection level is set initially
	V _{DL1}	VCC	*1 *4	3.8	4.0	4.2	V	
	V _{DL2}	VCC	*1 *5	4	4.2	4.4	V	
Hysteresis width	V _{HYS}	VCC	-	-	100	-	mV	When power-supply voltage rises
Low-voltage detection time	T _d	-	-	-	-	30	μs	
Power supply voltage regulation	-	VCC	-	-2	-	2	V/ms	*2

*1: If the fluctuation of the power supply has exceeded the detection voltage range within the time less than the low-voltage detection time (T_d), there is the possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

*2: Please suppress the change of the power supply within the range of the power-supply voltage regulation to do a low-voltage detection by detecting voltage (V_{DL})

*3: SYSC0_RUNLVDCFGR.LVDH1V = 0100_B or SYSC0_PSSLVDCFGR.LVDH1V = 0100_B

*4: SYSC0_RUNLVDCFGR.LVDH1V = 0101_B or SYSC0_PSSLVDCFGR.LVDH1V = 0101_B

*5: SYSC0_RUNLVDCFGR.LVDH1V = 0110_B or SYSC0_PSSLVDCFGR.LVDH1V = 0110_B

10.10 Low-Voltage Detection (RAM Retention Low-Voltage Detection)

 (TA: Recommended operating conditions, V_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Power supply voltage range	V _{RDP5}	-	-	0.6	-	1.4	V	
Detection voltage*	V _{RDL}	-	*1	0.9	0.95	1.0	V	When power-supply voltage falls
Hysteresis width	V _{RHYS}	-	-	-	75	-	mV	When power-supply voltage rises
Low-voltage detection time	T _{Rd}	-	-	-	-	30	μs	

*: This LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as this detection level is below the minimum guaranteed MCU operation voltage.

*1: If the fluctuation of the power supply has exceeded the detection voltage range within the time less than the low-voltage detection time (T_{Rd}), there is the possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

10.11 Low-Voltage Detection (1.2 V Power Supply Low-Voltage Detection)

 (TA: Recommended operating conditions, V_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks	Guaranteed MCU operation range
				Min	Typ	Max			
Power supply voltage range	V _{RDP5}	-	-	0.6	-	1.4	V		No
Detection voltage*	V _{RDL0}	-	*1 *2 *4	0.92	0.97	1.02	V	When power-supply voltage falls	
	V _{RDL1}	-	*1 *3 *4	1.02	1.07	1.12	V		
Hysteresis width	V _{RHYS}	-	-	-	75	-	mV	When power-supply voltage rises	
Low-voltage detection time	T _{Rd}	-	-	-	-	30	μs		

*: This LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage.

*1: If the fluctuation of the power supply has exceeded the detection voltage range within the time less than the low-voltage detection time (T_{Rd}), there is the possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

*2: SYSC0_RUNLVDCFGR.LVDL1V = 10_B or SYSC0_PSSLVDCFGR.LVDL1V = 10_B

*3: SYSC0_RUNLVDCFGR.LVDL1V = 11_B or SYSC0_PSSLVDCFGR.LVDL1V = 11_B

*4: These detection voltage level settings are below the minimum operation voltage.

Between these detection voltages and the minimum operation voltage, MCU functions are not guaranteed except for the low voltage detector.

Note that although the detection level is below the minimum operation voltage, the LVD reset factor flag is set as the voltage drops below the detection level.

10.12A/D Converter
10.12.1 Electrical Characteristics

 (T_A: Recommended operating conditions, V_{CC} = DV_{CC} = 5.0 V ±10 %, V_{SS} = DV_{SS} = AV_{SS} = 0.0 V)

Parameter	Symbol	Pin Name	Value			Unit	Remarks
			Min	Typ	Max		
Resolution	-	-	-	-	12	bit	
Total Error	-	-	-	-	±12	LSB	*3

*8: AN0 to AN2, and AN43

*9: AN44 to AN62

*10: AN3, AN5, AN6, AN9, AN10, AN12 to AN15, AN17 to AN24, and AN27 to AN31

10.12.2 Notes on Using A/D converters

About the Output Impedance of an External Circuit for Analog Input

When the external impedance is too high, the analog voltage sampling time may become insufficient. In this case, we recommend attaching a capacitor (about 0.1 μ F) to an analog input pin.

10.12.3 Definition of Terms

Resolution: Analog variation that is recognized by an A/D converter

Integral Nonlinearity error *: Deviation of the straight line connecting the zero transition point ("0000 0000 0000" <--> "0000 0000 0001") and full-scale transition point ("1111 1111 1110" <--> "1111 1111 1111") from actual conversion characteristics includes zero transition error, full-scale transition error, and non-linearity error.

Differential Nonlinearity error: Deviation from the ideal value of the input voltage required for changing the output code by 1 LSB

Total error: Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and non linearity error.

*: Represented as "Linearity error" in the former product series.

10.13 Flash Memory

Parameter	Rating			Unit	Remarks
	Min	Typ	Max		
Sector erase time	-	300	1100	ms	8-KB sector ^{*1} Internal preprogramming time included
	-	800	3700	ms	64-KB sector ^{*1} Internal preprogramming time included
8-bit write time	-	15	288	µs	System-level overhead time excluded ^{*1}
16-bit write time	-	19	384	µs	System-level overhead time excluded ^{*1}
32-bit write time	-	27	567	µs	System-level overhead time excluded ^{*1}
64-bit write time	-	45	945	µs	System-level overhead time excluded ^{*1}
8-bit (with ECC) write time	-	19	384	µs	System-level overhead time excluded ^{*1}
16-bit (with ECC) write time	-	23	483	µs	System-level overhead time excluded ^{*1}
32-bit (with ECC) write time	-	31	651	µs	System-level overhead time excluded ^{*1}
64-bit (with ECC) write time	-	49	1029	µs	System-level overhead time excluded ^{*1}
Erase count ^{*2} / Data retention time	1,000/20 years, 10,000/10 years, 100,000/5 years	-	-	-	Temperature at write/erase time Average temperature T _A = +85 degrees Celsius

*1: Guaranteed value for up to 100,000 erases

*2: Number of erases for each sector

Notes:

- While the Flash memory is written or erased, shutdown of the external power (V_{CC}) is prohibited.
- In the application system where V_{CC} might be shut down while writing or erasing, be sure to turn the power off by using an external low-voltage detection function.
- To put it concretely, after the external power supply voltage falls below the detection voltage (V_{DL}), hold V_{CC} at 2.7 V or more within the duration calculated by the following expression:

$$T_d^{*1} [\mu s] + (1 / F_{CRF}^{*2} [MHz]) \times 1029 + 25 [\mu s]$$

Product Status: Production

Errata Summary

The following table defines the errata applicability to available S6J3120 Series devices.

Items	Part Number	Fix Status
MCAN wrong message transmission	S6J3129HACSE20000 S6J3129HBCSE2000A S6J312AHACSE2000A	Not be planned.

1. MCAN wrong message transmission

■ Problem Definition

There is a possibility a message with an ID (arbitration field) and a format and DLC (control field) is transmitted which was not configured by the application. The message itself is syntactically correct and can be received by other nodes.

The occurrence of the limitation requires a certain relationship in time between a transmission request for sending a message and the coincidence of noise in the 3rd bit of intermission field which is treated as the start of new message transmission (SoF).

■ Trigger Condition

Under the following conditions a message with wrong ID, format and DLC is transmitted:

- M_CAN is in state "Receiver" (PSR.ACT = "10"), no pending transmission.
- A new transmission is requested after sample point of 2nd bit of intermission but before the 3rd bit of Intermission is reached.
- The CAN bus is sampled dominant at the third bit of Intermission which is treated as SoF (see ISO11898-1:2015 Section 10.4.2.2).

■ Scope of Impact

Under the conditions listed above it may happen, that:

- The shift register is not loaded with ID, format, and DLC of the requested message.
- The M_CAN will start arbitration with wrong ID, format, and DLC.
- In case the ID won arbitration, a CAN message with valid CRC is transmitted.
- In case this message is acknowledged, the ID stored in the Tx Event FIFO is the ID of the requested Tx message and not the ID of the message transmitted on the CAN bus
- Neither an error is detected by the transmitting node nor at the receiving node.

■ Workaround

Workaround 1:

This workaround avoids submitting a transmission request in the critical time window of about one bit time before the sample point of the 3rd bit of intermission field when on other pending transmission request exists:

- Request a new transmission if another transmission is already pending or when the M_CAN / M_TTCAN is not in state "Receiver" (when PSR.ACT ≠ "10").
- If no pending transmission request exists, the application software needs to evaluate the Rx Interrupt flags IR.DRX, IR.RF0N, IR.RF1N which are set at the last bit of EoF when a received and accepted message gets valid.
- A new transmission may be requested by writing to TXBAR once the Rx interrupt occurred and the application waited another 3 bit times before submitting its Tx request. Note the Rx interrupt is generated at the last bit of EoF which is followed by three bits of Intermission.
- The application has to take care that the transmission request for the CAN Protocol Controller is activated before the critical window of the following reception is reached.

A supplemental action can be applied in order to detect messages which contain wrong ID and control field information:

- A checksum covering arbitration and control fields can be added to the data field of the message to be transmitted, to detect frames transmitted with wrong arbitration and control fields.

Workaround 2:

This workaround ensures that always at least one pending Tx request exists. If that is the case, the application may launch its Tx requests at any time without suffering from the limitation.

- Define a low priority message with DLC = 0 that can be sent without harm. E.g. loses arbitration against all other application messages, does not pass any acceptance filter of nodes in the same network. DLC = 0 shall reduce latency for other application messages.
- Configure sufficient Tx buffers – at least two - for this message type thus that there is always another one waiting to be sent. E.g. an application that cannot react quickly enough with the time a single message of this type is sent, more than 2 Tx buffer may become necessary.
- The application uses the standard interfaces of the CAN / CAN FD stack to feed these messages.
- Whenever Tx confirmation is indicated for the second but last message of this type with pending Tx request, the application needs to submit at least one new Tx request. Note Tx confirmation is a standard feature in the AUTOSAR SW architecture.
- Before initially leaving INIT state of the M_CAN IP by clearing CCCR.INIT bit, make sure to activate a Tx request after having cleared CCCR.CCE. This will ensure that the conditions for the occurrence of the limitation when synchronizing to the CAN bus the first time after RESET are prevented.

■ Fix Status

Not be planned

15. Appendix

15.1 Application 1: JTAG tool connection

This is an application example of JTAG tool connection.

16. Major Changes

Page	Section	Change Results
27	4. I/O Circuit Types	<p>Revised Type C of "I/O Circuit Type" as follows: (Correct)</p> 
30	4. I/O Circuit Types	<p>Added Type R to "11. I/O Circuit Type" R</p>  <p>Output of 2 mA</p>
37	6. Handling Devices	<p>Revised the Vss Pin in Figure 8-1 Pin Assignment. (Correct)</p> <p style="text-align: center;">Figure 8-1 Pin Assignment</p> 
38	6. Handling Devices	<p>Revised the items as follows. (Correct)</p> <p>This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin (pin 126 in S6J312xHzB* specifications) for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet. *x: A/9/8, z: A/B</p>
39	7. Block Diagram	<p>Revised the title as follows. (Correct)</p> <p>Figure 9-1 S6J312xHzB* Block Diagram *x: A/9/8, z: A/B</p>
39	7. Block Diagram	<p>Added "Partial Wake up" to "Block Diagram"</p>

45	8. Memory Map	<p>Added the following note.</p> <p>When MPU attribute of Cortex®-R5 is configured as "Normal", store buffer inside Cortex®-R5 can operate and write data can be merged. To avoid influence of this data merger, MPU attribute "Device" or "Strongly Ordered" should be used. MPU attribute "Device" or "Strongly Ordered" must be used for areas below, to avoid this influence.</p> <ul style="list-style-type: none"> -Backup RAM area (BACKUP_RAM) [0E80_0000 ~ 0E87_FFFF] -Peripheral area (Peri area) [B000_0000 ~ B7FF_FFFF] -Error Config area (ERRCFG) [FFFE_E000 ~ FFFE_FFFF] <p>MPU attribute "Device" or "Strongly Ordered" is required for accesses to areas below, in particular situation.</p> <ul style="list-style-type: none"> - FLASH Memory (when writing commands) 																																																							
45	8. Memory Map	<p>Added the following note.</p> <p>SHE OFF product is prohibited to access SHE area (B200_0000 to B20F_FFFF)</p>																																																							
46,47	9. Pin Status in CPU Status	<p>Added Pin name about I²C and PWU to Table 11-1 Pin State Table (1/2) and Table 11-2 Pin State Table (2/2).</p>																																																							
47	9. Pin Status in CPU Status	<p>Deleted the following pin name about CANFD ch2 from Table 11-2 Pin State Table (2/2)</p> <p>Pin132 : TX2_1 Pin131 : RX2_1 Pin87 : RX0_1 Pin97 : RX0_0</p>																																																							
48	9. Pin Status in CPU Status	<p>Added the item as follows</p> <ul style="list-style-type: none"> *7: When the PWU function is enabled, a change to output occurs. *8: When PPC_PCFGrijj:POF[2:0] is set to initial value. *9: When reset is issued, the following ports become "L" output as the initial state. 																																																							

Page	Section	Change Results					
50	10. Electrical Characteristics 10.1 Absolute Maximum Ratings	Revised the remarks of Analog supply voltage (Error) $AV_{CC} \leq V_{CC}$ (Correct) $AV_{CC} = V_{CC}$					
50	10. Electrical Characteristics 10.1 Absolute Maximum Ratings	Revised the Symbol of Maximum clamp current. (Error) I_{CLAMP} (Correct) $ I_{CLAMP} $					
50	10. Electrical Characteristics 10.1 Absolute Maximum Ratings	Revised the following note. (Error) *2: VCC and DVCC must be set to the same voltage. Caution must be taken that AVCC and DVCC does not exceed VCC upon power-on and under other circumstances. (Correct) *2: AVCC, DVCC and VCC must be set to the same voltage. It is required that AVCC and DVCC do not exceed VCC and that the voltage at the analog inputs does not exceed AVCC when the power is switched on.					
52	10. Electrical Characteristics 10.2 Recommended operating conditions	Revised the following title. (Error) Rating (Correct) Value					
52	10. Electrical Characteristics 10.2 Recommended operating conditions	Revised the parameter of Smoothing capacitor as follows. (Correct) <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 25%;">Smoothing capacitor*</td> <td style="width: 10%;">C_{S1}</td> <td style="width: 10%;">4.7</td> <td style="width: 10%;">μF</td> <td style="width: 45%;">Tolerance of up to ±40%, 126pin Use a ceramic capacitor or a capacitor that has the similar frequency characteristics. Use a capacitor with a capacitance greater than CS as the smoothing capacitor on the VCC pin.</td> </tr> </table>	Smoothing capacitor*	C _{S1}	4.7	μF	Tolerance of up to ±40%, 126pin Use a ceramic capacitor or a capacitor that has the similar frequency characteristics. Use a capacitor with a capacitance greater than CS as the smoothing capacitor on the VCC pin.
Smoothing capacitor*	C _{S1}	4.7	μF	Tolerance of up to ±40%, 126pin Use a ceramic capacitor or a capacitor that has the similar frequency characteristics. Use a capacitor with a capacitance greater than CS as the smoothing capacitor on the VCC pin.			
52	10. Electrical Characteristics 10.2 Recommended operating conditions	Revised the remarks of Operating temperature as follows. (Error) S6J312HAA (Correct) S6J312xHzB* * x:A/9/8, z:A/B					
52	10. Electrical Characteristics 10.2 Recommended operating conditions	Revised the following Diagram (Correct) <p>· C Pin Connection Diagram</p> 					

Page	Section	Change Results
53	10. Electrical Characteristics 10.2 Recommended operating conditions	<p>Added the following notes.</p> <p>Notes:</p> <ul style="list-style-type: none"> -The following condition should be satisfied in order to facilitate heat dissipation. <ol style="list-style-type: none"> 1. 4 or more layers PCB should be used. 2. The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard) 3. 1 layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90% or more. The layer can be used for system ground. 4. 35~50% of the die stage area which is exposed at back surface of package should be soldered to a part of 1st layer. 5. The part of 1st layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes.
53,54	10. Electrical Characteristics 10.2 Recommended operating conditions	<p>Added the following notes and figures.</p> <p>Figure12.2-1: Example thermal via holes on PCB.</p> <p>Notes:</p> <ul style="list-style-type: none"> - Figure 12.2-1 is a schematic diagram showing PCB in section. - Figure 12.2-2 in the following pages are recommended land patterns for each package series. Thermal via holes should closely be placed and aligned with lands. - If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand. <p>Figure 12.2-2: Land Pattern and Thermal Via LEU144</p>
63	10. Electrical Characteristics 10.3 DC Characteristics	<p>Revised the following pins of Rup3 (Error) P321, TDI(P324), TMS,TCK (Correct) TDI(P324), TMS,TCK</p>
65	10. Electrical Characteristics 10.3 DC Characteristics	<p>Revised the following values and remarks.</p> <p>I_{CC5},I_{CC5S}:Remarks (Error) Operating at 112 MHz (Correct) Operating at 128MHz</p> <p>I_{CC5} : Value (Error) Normal Operation typ 100mA max 225mA (Correct) Normal Operation typ 90mA max 195mA</p> <p>ICCT52:Value (Error) max 115µA (Correct) max 100µA</p> <p>ICCT52M:Value (Error) typ 700µA max 885µA (Correct) typ 350µA max 520µA</p> <p>ICCH52:Value (Error) max 110µA (Correct) max 100µA</p>
65	10. Electrical Characteristics 10.3 DC Characteristics	<p>Added the following characteristic</p> <p>I_{CCP} PWU mode(Shutdown)</p>

71	10. Electrical Characteristics 10.4.2 Internal Clock Timing	<p>Revised the value of max internal frequency F_{CPU_CLK} in “Guaranteed operation range”</p> <p>(Error) 112MHz (Correct) 128MHz</p>																																																																																																																																																																																																																																																																																													
72	10. Electrical Characteristics 10.4.2 Internal Clock Timing	<p>Revised the followings “Relationship between the oscillation clock frequency and internal clock frequency”</p> <p>PLL Multiplier Setting (Error) 112 (Correct) 128</p> <p>PLL Clock (Error) 112MHz (Correct) 128MHz</p> <p>Notes (Error) The maximum PLL clock frequency must be 112MHz. (Correct) The maximum PLL clock frequency must be 128MHz.</p>																																																																																																																																																																																																																																																																																													
74	10. Electrical Characteristics 10.4.4 Power-on Conditions	<p>Added the parameter of “Level release voltage”</p>																																																																																																																																																																																																																																																																																													

Page	Section	Change Results								
74	10. Electrical Characteristics 10.4.4 Power-on Conditions	Revised the value of “Level detection voltage” (Error) min 2.25V typ 2.45V max 2.65V (Correct) min 2.15V typ 2.35V max 2.55V								
101,102	10. Electrical Characteristics 10.4.7.4 I ² C Timing (SMR:MD[2:0]=100B)	Added the characteristic of “I ² C Timing (SMR:MD[2:0]=100B)”								
116,117	10. Electrical Characteristics 10.12 A/D Converter 10.12.1 Electrical Characteristics	Revised the value of “Analog port input current” in the table, and revised the pin name note *7 to *9 (Correct) *7: AN3, AN5, AN6, AN9, AN10, AN12 to AN15, AN17 to AN24, and AN27 to AN42 *8: AN0 to AN2, and AN43 *9: AN44 to AN62								
119	10. Electrical Characteristics 10.12 A/D Converter 10.12.3 Definition of Terms	Revised the followings. (Error) Total error: Difference between the actual value and the theoretical value. The total error (Correct) Total error: Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and non linearity error.								
121	10. Electrical Characteristics 10.13 Flash Memory	Deleted the followings. *3: Target value								
122	11. Ordering Information	Added SHE option to the part number <table border="1"> <thead> <tr> <th>Part Number Option “z”</th> <th>SHE</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>SHE ON</td> </tr> <tr> <td>B</td> <td>SHE OFF</td> </tr> </tbody> </table>	Part Number Option “z”	SHE	A	SHE ON	B	SHE OFF		
Part Number Option “z”	SHE									
A	SHE ON									
B	SHE OFF									
122	12.Part Number Option	Added Flash memory size option to the part number. <table border="1"> <thead> <tr> <th>Part Number Option “x”</th> <th>FLASH Memory</th> </tr> </thead> <tbody> <tr> <td>A</td> <td>1MByte</td> </tr> <tr> <td>9</td> <td>768KByte</td> </tr> <tr> <td>8</td> <td>512KByte</td> </tr> </tbody> </table>	Part Number Option “x”	FLASH Memory	A	1MByte	9	768KByte	8	512KByte
Part Number Option “x”	FLASH Memory									
A	1MByte									
9	768KByte									
8	512KByte									
Revision *B										
1	Cover	Revised the title as follow (error) S6J3120 Series 32-bit Microcontroller Spansion® Traveo™ Family (correct) S6J3120 Series 32-Bit Traveo™ Family Microcontroller Datasheet								
2	Features	Added “CAN-FD (V3.2.0)” under “CAN controller: CAN-FD Max 3 channel”.								
37	6.Handling Devices	Revised the following notice. (Error) About the Power-on Time To prevent the internal built-in voltage step-down circuit from malfunctioning, secure a voltage rising time of 50 μs (between 0.2 V and 2.7 V) or longer at the power-on time. (Correct) About the Power-on Time To prevent a malfunction of the voltage step-down circuit built in the device, the voltage rising must be monotonic during power-on.								

Page	Section	Change Results
70	10. Electrical Characteristics 10.4.2 Internal Clock Timing	Revised the following symbol. (Error) tCLK_FMA (Correct) tCLK_DMA
74	10. Electrical Characteristics 10.4.4 Power-on Conditions	Deleted the Slope detection undetected specification. Added the Power ramp rate and Maximum ramp rate guaranteed to not generate power-on reset. *1, *2: Changed the sentence. Added *3, *4, Note, Figure at the Power off time, Power ramp rate, Maximum ramp rate guaranteed to not generate power-on reset.
101	10. Electrical Characteristics 10.4.7.4 I2C Timing (SMR:MD[2:0]=100B)	Revised the following pin names. (Error) SCL0 to SCL4 / SDA0 to SDA4 (Correct) SCL0, SCL3, SCL4 / SDA0, SDA3, SDA4
115	10. Electrical Characteristics 10.10 Low-Voltage Detection (RAM Retention Low-Voltage Detection)	Revised the title in 10.10 “Internal Low-Voltage Detection” to “RAM Retention Low-Voltage Detection”.
115	10. Electrical Characteristics 10.11 Low-Voltage Detection (1.2 V Power Supply Low-Voltage Detection)	Added the notice *4
123	11. Ordering Information	Revised the following part number. (Error) S6J312xHzBASEy0000* (Correct) S6J312xHzCSEy0000*
1,2,6 to 9, 38 to 40, 42,50,52, 65,69,70, 74,123	-	Revised part number from S6J312xxxB to S6J312xxxC.

NOTE: Please see “Document History” about later revised information.

Document History

Document Title: S6J3120 Series 32-Bit Traveo™ Family Microcontroller Datasheet

Document Number: 002-04863

Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	-	HIHA	8/7/2014	Initial release New Spec.
*A	4993737	WECU	10/29/2015	Added full product names. Added 144pin PWUTRG function. Added simultaneous function for start timing of PWM does not overlap. Added I2C function. Added SHE-OFF Option. Updated CANFD macro (updated to v3.2.0). Revised min value of VIH6 (TRST, TCK, TDI, TMS) from 2.0V to 2.3V. Revised operating frequency to 128MHz, and revised clock frequency based 128MHz. Revised current consumption standard (ICC5, ICCT52, ICCT52M, ICCH52). Added partial wakeup macro. For detail, see "Major Changes".
*B	5309249	WECU	06/16/2016	Revised part number from S6J311xxxB to S6J311xxxC. For detail, see "Major Changes".
*C	5375465	WECU	07/27/2016	Page 74, 10.4.4 Power-on Conditions Revised Level detection time from 30 to 540, Revised *1 to *4 and Note. Page 115, 10.10 Low-Voltage Detection (RAM Retention Low-Voltage Detection) Added * and Note to Detection voltage. Page 115, 10.11 Low-Voltage Detection (1.2 V Power Supply Low-Voltage Detection) Added * and Note to Detection voltage.
*D	5554888	WECU	12/15/2016	Page 124, Replaced 13. Package Dimensions Page 125, Added 14. Appendix
*E	5782640	YOST	06/22/2017	Updated Cypress logo. Updated Copyright.
*F	6251474	MXNI	07/18/2018	Part Number Option is updated.
*G	6295507	MXNI	08/30/2018	Page 99 Added 14. Errata

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
