# Phase Dimmable PSR LED Driver IC for LED Lighting

## **Description**

CY39C603 is a Primary Side Regulation (PSR) LED driver IC for LED lighting. Using the information of the primary peak current and the transformer-energy-zero time, it is able to deliver a well regulated current to the secondary side without using an opto-coupler in an isolated flyback topology. Operating in critical conduction mode, a smaller transformer is required. In addition, CY39C603 has a built-in phase dimmable circuit and can constitute flicker less lighting systems for phase dimming with low-component count. It is most suitable for the general lighting applications, for example replacement of commercial and residential incandescent lamps.

#### **Features**

- ■PSR topology in an isolated flyback circuit
- High power factor (>0.9 : without dimmer) in Single Conversion
- High efficiency (>80 %: without dimmer) and low EMI by detecting transformer zero energy
- ■Built-in phase dimmable circuit
  - □ Dimming curve based on conduction angle
  - □ Dimmer hold current control
- Highly reliable protection functions
  - ☐ Under voltage lock out (UVLO)
  - ☐ Over voltage protection (OVP)
  - ☐ Over current protection (OCP)
  - ☐ Over temperature protection (OTP)
- ■Switching frequency setting: 30 kHz to 133 kHz
- ■Input voltage range VDD: 9 V to 20 V
- ■Input voltage for LED lighting applications: AC110V<sub>RMS</sub>
- ■Output power range for LED lighting applications: 15 W to 50 W
- ■Package : SOP-14 (5.30 mm × 10.15 mm × 2.25 mm [Max])

#### **Applications**

- ■Phase dimmable (Leading/Trailing) LED lighting
- ■LED lighting

#### **WARNING:**

- 1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
- 2. Any use of semiconductor devices will be under their recommended operating condition.
- 3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
- 4. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

## 7. Standard Characteristics

**Figure 7-1 Standard Characteristics** 

## 8. Function Explanations

#### 8.1 LED Current Control by PSR(Primary Side Regulation)

CY39C603 regulates the average LED current (I<sub>LED</sub>) by feeding back the information based on Primary Winding peak current (I<sub>P\_PEAK</sub>), Secondary Winding energy discharge time (T<sub>DIS</sub>) and switching period (T<sub>SW</sub>). Figure 8-1 shows the operating waveform in steady state. I<sub>P</sub> is Primary Winding current and I<sub>S</sub> is Secondary Winding current. I<sub>LED</sub> as an average current of the Secondary Winding is described by the following equation.

$$I_{LED} = \frac{1}{2} \times I_{S\_PEAK} \times \frac{T_{DIS}}{T_{SW}}$$

Using I<sub>P\_PEAK</sub> and the transformer Secondary to Primary turns ratio (N<sub>P</sub>/N<sub>S</sub>), Secondary Winding peak current (I<sub>S\_PEAK</sub>) is described by the following equation.

$$I_{S\_PEAK} = \frac{N_P}{N_S} \times I_{P\_PEAK}$$

Therefore,

$$I_{LED} = \frac{1}{2} \times \frac{N_P}{N_S} \times I_{P\_PEAK} \times \frac{T_{DIS}}{T_{SW}}$$

CY39C603 detects  $T_{DIS}$  by monitoring the TZE pin and  $I_{P\_PEAK}$  by monitoring the CS pin and then controls  $I_{LED}$ . An internal Err Amp sinks gm current proportional to  $I_{P\_PEAK}$  from the COMP pin during  $T_{DIS}$  period. In steady state, since the average of the gm current is equal to internal reference current ( $I_{SO}$ ), the voltage on the COMP pin ( $V_{COMP}$ ) is nearly constant.

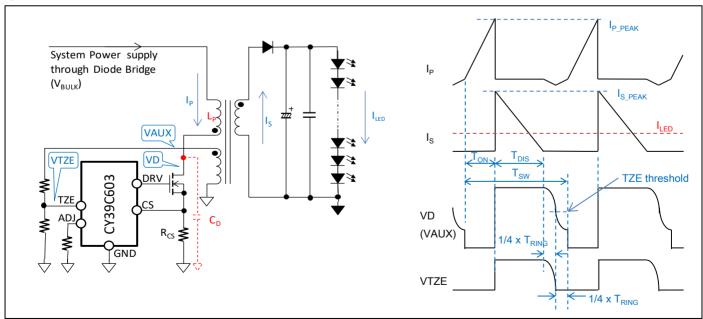

$$I_{P,PEAK} \times R_{CS} \times gm \times T_{DIS} = I_{SO} \times T_{SW}$$

In above equation, gm is transconductance of the Err Amp and Rcs is a sense resistance.

Eventually, ILED can be calculated by the following equation.

$$I_{LED} = \frac{1}{2} \times \frac{N_P}{N_S} \times \frac{I_{SO}}{gm} \times \frac{1}{R_{CS}}$$

Figure 8-1 LED Current Control Waveform

#### 8.2 PFC (Power Factor Correction) Function

Switching on time  $(T_{ON})$  is generated by comparing  $V_{COMP}$  with an internal sawtooth waveform (refer to Figure 3-1). Since  $V_{COMP}$  is slow varying with connecting an external capacitor  $(C_{COMP})$  from the COMP pin to the GND pin,  $T_{ON}$  is nearly constant within an AC line cycle. In this state,  $I_{P\_PEAK}$  is nearly proportional to the AC line voltage  $(V_{BULK})$ . It can bring the phase differences between the input voltage and the input current close to zero, so that high Power Factor can be achieved.

#### 8.3 Phase Dimming Function

CY39C603 is compatible with both leading-edge dimmers (TRIAC dimming) and trailing-edge dimmers.

To realize the phase dimming, this device has two functions, dimmer conduction angle detect function for LED current control and TRIAC dimmer hold current control function.

Figure 8-2 shows how CY39C603 detects the conduction angle.  $V_{BULK}$  is scaled via a resistor divider connected to the VAC pin. The conduction angle is detected by monitoring the voltage on the VAC pin ( $V_{VAC}$ ).

CY39C603 measures a half of power cycle period (Tpow) as duration between negative crossings of V<sub>VAC</sub> and a Phase Comp threshold voltage (V<sub>PHTH2</sub>). Dimmer-ON period (Tdim) is measured as duration between a positive crossing of V<sub>VAC</sub> and another Phase Comp threshold voltage (V<sub>PHTH1</sub>) and the following negative crossing. Conduction angle is defined as Tdim/Tpow × 180°.

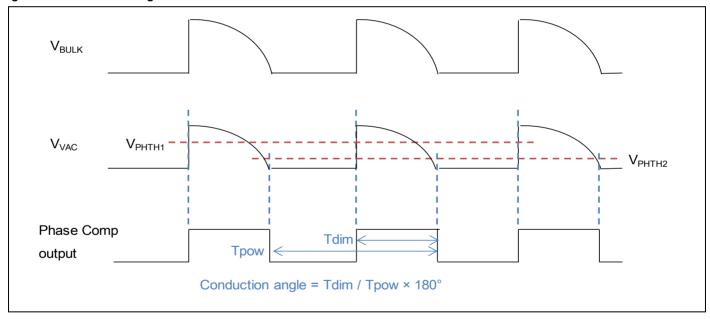

Figure 8-2 Conduction Angle Detection Waveform

CY39C603 regulates LED current by changing a reference of Err Amp as a function of the conduction angle. Table 8-1 shows I<sub>LED</sub> dimming ratio based on the conduction angle.

In addition, the initial ILED ratio in Power-On state is 5%.

Table 8-1 ILED Ratio Based on Conduction Angles

| Conduction Angle   | I <sub>LED</sub> Ratio [%] |
|--------------------|----------------------------|
| θ < 45deg          | 5                          |
| 45deg ≤ θ < 90deg  | (25/45) × θ -20            |
| 90deg ≤ θ < 135deg | (70/45) × θ -110           |
| 135deg ≤ θ         | 100                        |

#### 8.4 HOLD Current Control Function

The hold current control function prevents LEDs from flickering caused by shortage of hold current. The hold current (I<sub>HOLD</sub>) is the minimum current required to flow through TRIAC dimmer in order to keep the TRIAC on (refer to Figure 8-3). In small conduction angle, since I<sub>LED</sub> can be low, AC/DC Converter current (I<sub>BULK</sub>) and TRIAC dimmer current (I<sub>TRIAC</sub>) are reduced. Once I<sub>TRIAC</sub> falls below I<sub>HOLD</sub>, TRIAC goes off and this results in LED flickering. CY39C603 controls I<sub>TRIAC</sub> larger than I<sub>HOLD</sub> by adding the current (I<sub>BIP</sub>) via a BIP transistor (M1) with sensing I<sub>TRIAC</sub> and keeps the TRIAC on.

 $I_{TRIAC}$  is sensed with a resistor (Rs). A bypass diode (D<sub>BYPASS</sub>) is used to clamp the voltage between Rs terminals (V<sub>RS</sub>) and prevent the voltage on the HOLDDET pin (V<sub>HOLDDET</sub>) from exceeding absolute maximum ratings. An offset resistor (R<sub>OFFSET</sub>) is used to add an offset voltage to V<sub>HOLDDET</sub> and prevent V<sub>HOLDDET</sub> from the above ratings.

Rs is set as the following equation.

$$R_S = \frac{R_{OFFSET} \times I_{HOLDDET} - V_{HOLDTH}}{I_{TRIACMIN}}$$

where I<sub>HOLDDET</sub> is the current of the HOLDDET pin, V<sub>HOLDTH</sub> is Hold Amp threshold voltage, and I<sub>TRIACMIN</sub> is minimum TRIAC current chosen by designers.

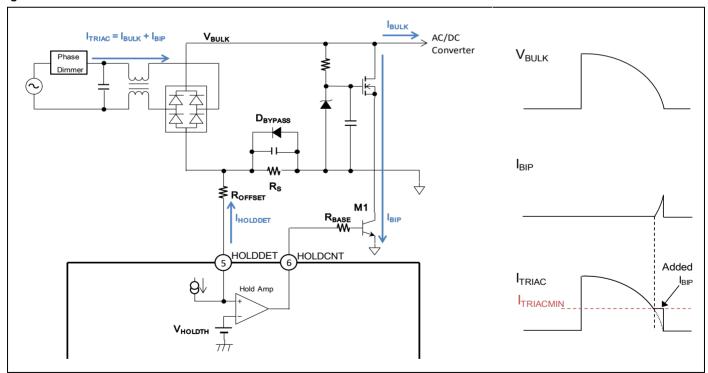

ROFFSET is set as the following equation.

$$R_{OFFSET} > \frac{V_{BYPASSMAX} - 0.3V}{I_{HOLDDET}}$$

where VBYPASSMAX is the maximum forward voltage of DBYPASS.

Hold Amp is designed only for driving BIP transistors. Connecting a resistor (R<sub>BASE</sub>) between the HOLDCNT pin and M1 base terminal limits the maximum I<sub>BIP</sub> value and clamp the rush current at TRIAC dimmer-on timing.

Figure 8-3 HOLD Current Control Waveform

#### 8.5 Power-On Sequence

When the AC line voltage is supplied, V<sub>BULK</sub> is powered from the AC line through a diode bridge, and the VDD pin is charged from V<sub>BULK</sub> through an external source-follower BiasMOS.(Figure 8-4 red path)

When the VDD pin is charged up and the voltage on the VDD pin ( $V_{VDD}$ ) rises above the UVLO threshold voltage, an internal Bias circuit starts operating, and CY39C603 starts the conduction angle detection (refer to 8.3). After the UVLO is released, this device enables switching and is operating in a forced switching mode ( $T_{ON} = 1.5 \mu s$ ,  $T_{OFF} = 78 \mu s$  to 320  $\mu s$ ). When the voltage on the TZE pin reaches the Zero energy threshold voltage ( $V_{TZETH} = 0.7V$ ), CY39C603 enters normal operation mode. After the switching begins, the VDD pin is also charged from Auxiliary Winding through an external diode (DBIAS).(Figure 8-4 blue path)

During non-conduction period  $V_{VDD}$  is not supplied from  $V_{BULK}$  or Auxiliary Winding. It is necessary to set an appropriate capacitor of the VDD pin in order to keep  $V_{VDD}$  above the UVLO threshold voltage in this period. An external diode (D1) between BiasMOS and the VDD pin is used to prevent discharge from the VDD pin to  $V_{BULK}$  at zero cross points of the AC line voltage.

Figure 8-4 VDD Supply Path at Power-On

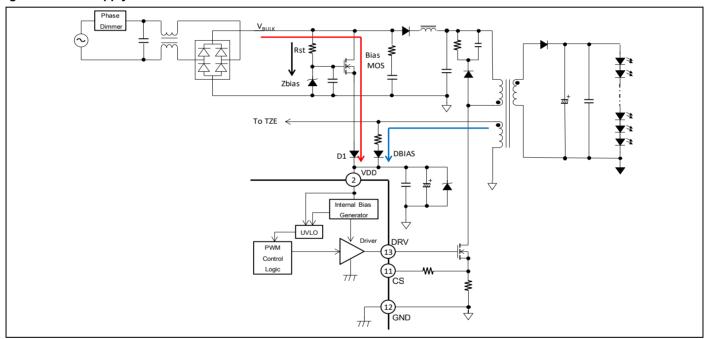

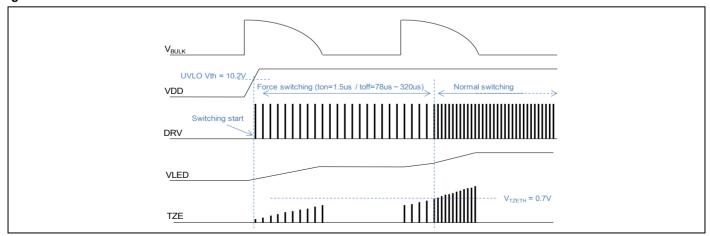

Figure 8-5 Power-On Waveform

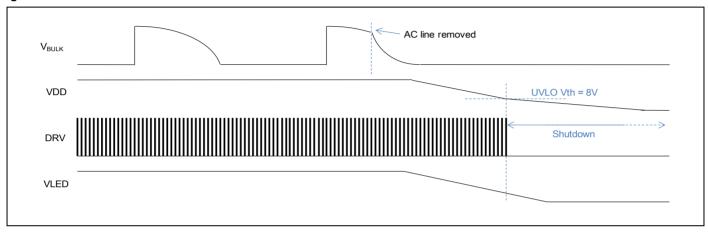

#### 8.6 Power-Off Sequence

After the AC line voltage is removed,  $V_{BULK}$  is discharged by switching operation and the Hold current circuit. Since any Secondary Winding current does not flow,  $I_{LED}$  is supplied only from output capacitors and decreases gradually.  $V_{VDD}$  also decreases because there is no current supply from both Auxiliary Winding and  $V_{BULK}$ . When  $V_{VDD}$  falls below the UVLO threshold voltage, CY39C603 shuts down.

Figure 8-6 Power-Off Waveform

#### 8.7 IP\_PEAK Detection Function

CY39C603 detects Primary Winding peak current (IP\_PEAK) of Transformer. ILED is set by connecting a sense resistance (R<sub>CS</sub>) between the CS pin and the GND pin. Maximum IP\_PEAK (IP\_PEAKMAX) limited by Over Current Protection (OCP) can also be set with the resistance.

Using the Secondary to Primary turns ratio ( $N_P/N_S$ ) and  $I_{LED}$ ,  $R_{CS}$  is set as the following equation (refer to 8.1).

$$R_{CS} = \frac{N_P}{N_S} \times \frac{0.132}{I_{LED}}$$

In addition, using the OCP threshold voltage (VOCPTH) and RCS, IP\_PEAKMAX is calculated with the following equation.

$$I_{P\_PEAKMAX} = \frac{V_{OCPTH}}{R_{CS}}$$

#### 8.8 Zero Voltage Switching Function

CY39C603 has built-in zero voltage switching function to minimize switching loss of the external switching MOSFET. This device detects a zero crossing point through a resistor divider connected from the TZE pin to Auxiliary Winding. A zero energy detection circuit detects a negative crossing point of the voltage on the TZE pin to Zero energy threshold voltage (V<sub>TZETL</sub>). On-timing of switching MOSFET is decided with waiting an adjustment time (t<sub>ADJ</sub>) after the negative crossing occurs.

 $t_{ADJ}$  is set by connecting an external resistance ( $R_{ADJ}$ ) between the ADJ pin and the GND pin. Using Primary Winding inductance ( $L_P$ ) and the parasitic drain capacitor of switching MOSFET ( $C_D$ ),  $t_{ADJ}$  is calculated with the following equation.

$$t_{ADJ} = \frac{\pi \sqrt{L_P \times C_D}}{2}$$

Using tadd, Radd is set as the following equation.

$$R_{ADI}[k\Omega] = 0.0927 \times t_{ADI}[ns]$$

#### 8.9 Protection Functions

#### **Under Voltage Lockout Protection (UVLO)**

The under voltage lockout protection (UVLO) prevents IC from a malfunction in the transient state during  $V_{VDD}$  startup and a malfunction caused by a momentary drop of  $V_{VDD}$ , and protects the system from destruction/deterioration. An UVLO comparator detects the voltage decrease below the UVLO threshold voltage on the VDD pin, and then the DRV pin is turned to "L" and the switching stops. CY39C603 automatically returns to normal operation mode when  $V_{VDD}$  increases above the UVLO threshold voltage.

#### **Over Voltage Protection (OVP)**

The over voltage protection (OVP) protects Secondary side components from an excessive stress voltage. If the LED is disconnected, the output voltage of Secondary Winding rises up. The output overvoltage can be detected by monitoring the TZE pin. During Secondary Winding energy discharge time,  $V_{TZE}$  is proportional to  $V_{AUX}$  and the voltage of Secondary Winding (refer to 8.1). When  $V_{TZE}$  rises higher than the OVP threshold voltage for 3 continues switching cycles, the DRV pin is turned to "L", and the switching stops (latch off). When  $V_{VDD}$  drops below the UVLO threshold voltage, the latch is removed.

#### **Over Current Protection (OCP)**

The over current protection (OCP) prevents inductor or transformer from saturation. The drain current of the external switching MOSFET is limited by OCP. When the voltage on the CS pin reaches the OCP threshold voltage, the DRV pin is turned to "L" and the switching cycle ends. After zero crossing is detected on the TZE pin again, the DRV pin is turned to "H" and the next switching cycle begins.

#### **Over Temperature Protection (OTP)**

The over temperature protection (OTP) protects IC from thermal destruction. When the junction temperature reaches +150°C, the DRV pin is turned to "L", and the switching stops. It automatically returns to normal operation mode if the junction temperature falls back below +125°C.

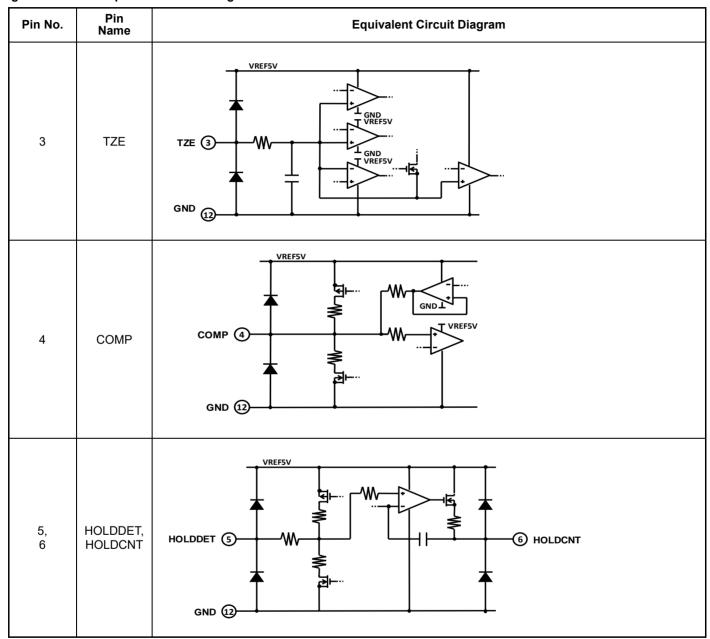

**Table 8-2 Protection Functions Table** 

|  |        | PIN Op      | peration      |        | Detection   | Return                    |                 |  |

## 11. Usage Precautions

#### Do not configure the IC over the maximum ratings.

If the IC is used over the maximum ratings, the LSI may be permanently damaged.

It is preferable for the device to normally operate within the recommended usage conditions. Usage outside of these conditions can have an adverse effect on the reliability of the LSI.

#### Use the device within the recommended operating conditions.

The recommended values guarantee the normal LSI operation under the recommended operating conditions.

The electrical ratings are guaranteed when the device is used within the recommended operating conditions and under the conditions stated for each item.

#### Take appropriate measures against static electricity.

- Containers for semiconductor materials should have anti-static protection or be made of conductive material.
- ■After mounting, printed circuit boards should be stored and shipped in conductive bags or containers.
- ■Work platforms, tools, and instruments should be properly grounded.
- ■Working personnel should be grounded with resistance of 250 k $\Omega$  to 1 M $\Omega$  in serial between body and ground.

#### Do not apply negative voltages.

The use of negative voltages below - 0.3 V may make the parasitic transistor activated to the LSI, and can cause malfunctions.

# 12. RoHS Compliance Information

This product has observed the standard of lead, cadmium, mercury, Hexavalent chromium, polybrominated biphenyls (PBB), and polybrominated diphenyl ethers (PBDE).

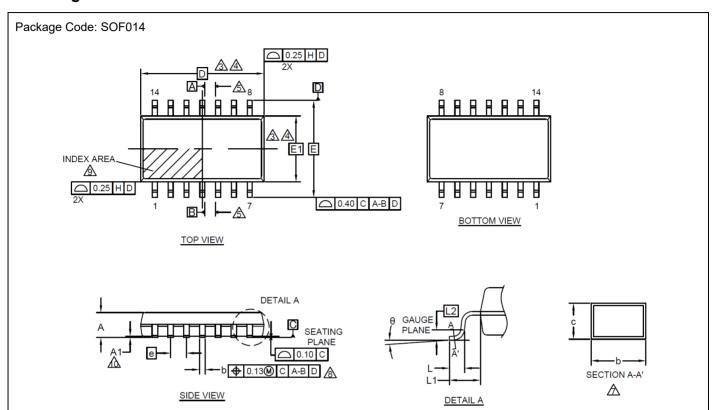

## 13. Ordering Information

#### **Table 13-1 Ordering Information**

| Part Number         | Package            | Shipping Form |  |
|---------------------|--------------------|---------------|--|
| CY39C603PF-G-JNEFE1 | 14-pin plastic SOP | Emboss        |  |
| CY39C603PF-G-JNE1   | (SOF014)           | Tube          |  |

## 14. Package Dimensions

| SYMBOL   | DIMENSIONS    |         |      |  |

| E1       | 5.30 BSC      |         |      |  |
| θ        | 0°            | _       | 8°   |  |
| С        | 0.13          |         | 0.20 |  |
| b        | 0.39 0.47 0.9 |         | 0.55 |  |
| L        | 0.45          | 0.60    | 0.75 |  |
| L 1      | 1.25 REF      |         |      |  |
| L 2      | 0.25 BSC      |         |      |  |
|          | e 1.27 BSC    |         |      |  |

#### NOTES

- 1. ALL DIMENSIONS ARE IN MILLIMETER.
- 2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
- ⚠ DIMENSIONING D INCLUDE MOLD FLASH, DIMENSIONING E1 DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.025 mm PER SIDE. D and E1 DIMENSION ARE DETERMINED AT DATUM H.
- THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM.

  DIMENSIONING D and E1 ARE DETERMINED AT THE OUTERMOST
  EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH,
  THE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING
  ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
- △ DATUMS A & B TO BE DETERMINED AT DATUM H.
- "N" IS THE MAXIMUM NUMBER OF TERMINAL POSITIONS FOR THE SPECIFIED PACKAGE LENGTH.
- ↑ THE DIMENSION APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 mm TO 0.25mm FROM THE LEAD TIP.
- ⚠ DIMENSION "b" DOES NOT INCLUDE THE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.10mm TOTAL IN EXCESS OF THE "b" DIMENSION AT MAXIMUM MATERIAL CONDITION.
  - THE DAMBAR MAY NOT BE LOCATED ON THE LOWER RADIUS OF THE FOOT.
- ⚠ THIS CHAMFER FEATURE IS OPTIONAL. LF IT IS NOT PRESENT, THEN A PIN 1 IDENTIFIER MUST BE LOCATED WITHIN THE INDEX AREA INDICATED
- 11. JEDEC SPECIFICATION NO. REF: N/A
