

## FEATURES

2M x 8 MRAM Memory

- +3.3 Volt power supply
- Fast 35 ns read/write cycle
- SRAM compatible timing
- Unlimited read & write endurance
- Data always non-volatile for >20-years at temperature
- RoHS-compliant small footprint BGA and TSOP2 packages
- All products meet MSL-3 moisture sensitivity level

## BENEFITS

- One memory replaces FLASH, SRAM, EEPROM and BBSRAM in systems for simpler, more efficient designs
- Improves reliability by replacing battery-backed SRAM

## INTRODUCTION

The **MR4A08B** is a 16,777,216-bit magnetoresistive random access memory (MRAM) device organized as 2,097,152 words of 8 bits. The MR4A08B offers SRAM compatible 35ns read/write timing with unlimited endurance. Data is always non-volatile for greater than 20-years. Data is automatically protected on power loss by low-voltage inhibit circuitry to prevent writes with voltage out of specification. The MR4A08B is the ideal memory solution for applications that must permanently store and retrieve critical data and programs quickly.

The **MR4A08B** is available in small footprint 400-mil, 44-lead plastic small-outline TSOP type-II package or 10 mm x 10 mm, 48-pin ball grid array (BGA) package with 0.75 mm ball centers. These packages are compatible with similar low-power SRAM products and other non-volatile RAM products.

The **MR4A08B** provides highly reliable data storage over a wide range of temperatures. The product is offered with commercial (0 to +70 °C) and industrial (-40 to +85 °C) operating temperature range options.

## 2. ELECTRICAL SPECIFICATIONS

### Absolute Maximum Ratings

This device contains circuitry to protect the inputs against damage caused by high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage greater than maximum rated voltages to these high-impedance (Hi-Z) circuits.

The device also contains protection against external magnetic fields. Precautions should be taken to avoid application of any magnetic field more intense than the maximum field intensity specified in the maximum ratings.

**Table 2.1 Absolute Maximum Ratings<sup>1</sup>**

| Parameter   | Symbol           | Value                  | Unit |
|---|------------------|------------------------|------|
| Supply voltage <sup>2</sup>   | $V_{DD}$         | -0.5 to 4.0            | V    |
| Voltage on any pin <sup>2</sup>   | $V_{IN}$         | -0.5 to $V_{DD} + 0.5$ | V    |
| Output current per pin  | $I_{OUT}$        | $\pm 20$               | mA   |
| Package power dissipation <sup>3</sup>                                  | $P_D$            | 0.600                  | W    |
| Temperature under bias<br>MR4A08B (Commercial)<br>MR4A08BC (Industrial) | $T_{BIAS}$       | -10 to 85<br>-45 to 95 | °C   |
| Storage Temperature   | $T_{stg}$        | -55 to 150             | °C   |
| Lead temperature during solder (3 minute max)                           | $T_{Lead}$       | 260                    | °C   |
| Maximum magnetic field during write<br>MR4A08B (All Temperatures)       | $H_{max\_write}$ | 8000                   | A/m  |
| Maximum magnetic field during read or standby                           | $H_{max\_read}$  | 8000                   | A/m  |

<sup>1</sup> Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to recommended operating conditions. Exposure to excessive voltages or magnetic fields could affect device reliability.

<sup>2</sup> All voltages are referenced to  $V_{SS}$ .

<sup>3</sup> Power dissipation capability depends on package characteristics and use environment.

Table 2.2 Operating Conditions

| Parameter   | Symbol   | Min               | Typical | Max                         | Unit |
|---|----------|-------------------|---------|-----------------------------|------|
| Power supply voltage  | $V_{DD}$ | 3.0 <sup>1</sup>  | 3.3     | 3.6                         | V    |
| Write inhibit voltage   | $V_{WI}$ | 2.5               | 2.7     | 3.0 <sup>1</sup>            | V    |
| Input high voltage  | $V_{IH}$ | 2.2               | -       | $V_{DD} + 0.3$ <sup>2</sup> | V    |
| Input low voltage   | $V_{IL}$ | -0.5 <sup>3</sup> | -       | 0.8                         | V    |
| Temperature under bias<br>MR4A08B (Commercial)<br>MR4A08BC (Industrial) | $T_A$    | 0<br>-40          |         | 70<br>85                    | °C   |

1. There is a 2 ms startup time once  $V_{DD}$  exceeds  $V_{DD}(\min)$ . See **Power Up and Power Down Sequencing** below.
2.  $V_{IH}(\max) = V_{DD} + 0.3 V_{DC}$ ;  $V_{IH}(\max) = V_{DD} + 2.0 V_{AC}$  (pulse width  $\leq 10$  ns) for  $I \leq 20.0$  mA.
3.  $V_{IL}(\min) = -0.5 V_{DC}$ ;  $V_{IL}(\min) = -2.0 V_{AC}$  (pulse width  $\leq 10$  ns) for  $I \leq 20.0$  mA.

### Power Up and Power Down Sequencing

MRAM is protected from write operations whenever  $V_{DD}$  is less than  $V_{WI}$ . As soon as  $V_{DD}$  exceeds  $V_{DD}(\min)$ , there is a startup time of 2 ms before read or write operations can start. This time allows memory power supplies to stabilize.

The  $\bar{E}$  and  $\bar{W}$  control signals should track  $V_{DD}$  on power up to  $V_{DD} - 0.2$  V or  $V_{IH}$  (whichever is lower) and remain high for the startup time. In most systems, this means that these signals should be pulled up with a resistor so that signal remains high if the driving signal is Hi-Z during power up. Any logic that drives  $\bar{E}$  and  $\bar{W}$  should hold the signals high with a power-on reset signal for longer than the startup time.

During power loss or brownout where  $V_{DD}$  goes below  $V_{WI}$ , writes are protected and a startup time must be observed when power returns above  $V_{DD}(\min)$ .

Figure 2.1 Power and Power Down Diagram

Table 2.3 DC Characteristics

| Parameter  | Symbol       | Min                   | Typical | Max                   | Unit    |
|--|--------------|-----------------------|---------|-----------------------|---------|

Read Mode

Table 3.3 Read Cycle Timing<sup>1</sup>

| Parameter                                       | Symbol     | Min | Max | Unit |
|---|------------|-----|-----|------|
| Read cycle time                                 | $t_{AVAV}$ | 35  | -   | ns   |
| Address access time                             | $t_{AVQV}$ | -   | 35  | ns   |
| Enable access time <sup>2</sup>                 | $t_{ELQV}$ | -   | 35  | ns   |
| Output enable access time                       | $t_{GLQV}$ | -   | 15  | ns   |
| Output hold from address change                 | $t_{AXQX}$ | 3   | -   | ns   |
| Enable low to output active <sup>3</sup>        | $t_{ELQX}$ | 3   | -   | ns   |
| Output enable low to output active <sup>3</sup> | $t_{GLQX}$ | 0   | -   | ns   |
| Enable high to output Hi-Z <sup>3</sup>         | $t_{EHQZ}$ | 0   | 15  | ns   |
| Output enable high to output Hi-Z <sup>3</sup>  | $t_{GHQZ}$ | 0   | 10  | ns   |

<sup>1</sup>  $\bar{W}$  is high for read cycle. Power supplies must be properly grounded and decoupled, and bus contention conditions must be minimized or eliminated during read or write cycles.

<sup>2</sup> Addresses valid before or at the same time  $\bar{E}$  goes low.

<sup>3</sup> This parameter is sampled and not 100% tested. Transition is measured  $\pm 200$  mV from the steady-state voltage.

Figure 3.3A Read Cycle 1

Note: Device is continuously selected ( $\bar{E} \leq V_{IL}$ ,  $\bar{G} \leq V_{IL}$ ).

Figure 3.3B Read Cycle 2

**Table 3.4 Write Cycle Timing 1 ( $\overline{W}$  Controlled)<sup>1</sup>**

| Parameter  | Symbol                   | Min | Max | Unit |
|--|--------------------------|-----|-----|------|
| Write cycle time <sup>2</sup>                        | $t_{AVAV}$               | 35  | -   | ns   |
| Address set-up time                                  | $t_{AVWL}$               | 0   | -   | ns   |
| Address valid to end of write ( $\overline{G}$ high) | $t_{AVWH}$               | 18  | -   | ns   |
| Address valid to end of write ( $\overline{G}$ low)  | $t_{AVWH}$               | 20  | -   | ns   |
| Write pulse width ( $\overline{G}$ high)             | $t_{WLWH}$<br>$t_{WLEH}$ | 15  | -   | ns   |
| Write pulse width ( $\overline{G}$ low)              | $t_{WLWH}$<br>$t_{WLEH}$ | 15  | -   | ns   |
| Data valid to end of write                           | $t_{DVWH}$               | 10  | -   | ns   |
| Data hold time                                       | $t_{WHDX}$               | 0   | -   | ns   |
| Write low to data Hi-Z <sup>3</sup>                  | $t_{WLQZ}$               | 0   | 12  | ns   |
| Write high to output active <sup>3</sup>             | $t_{WHQX}$               | 3   | -   | ns   |
| Write recovery time                                  | $t_{WHAX}$               | 12  | -   | ns   |

<sup>1</sup> All write occurs during the overlap of  $\overline{E}$  low and  $\overline{W}$  low. Power supplies must be properly grounded and decoupled and bus contention conditions must be minimized or eliminated during read and write cycles. If  $\overline{G}$  goes low at the same time or after  $\overline{W}$  goes low, the output will remain in a high impedance state. After  $\overline{W}$ ,  $\overline{E}$  or  $\overline{UB/LB}$  has been brought high, the signal must remain in steady-state high for a minimum of 2 ns. The minimum time between  $\overline{E}$  being asserted low in one cycle to  $\overline{E}$  being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.

<sup>2</sup> All write cycle timings are referenced from the last valid address to the first transition address.

<sup>3</sup> This parameter is sampled and not 100% tested. Transition is measured  $\pm 200$  mV from the steady-state voltage. At any given voltage or temperature,  $t_{WLQZ}(\text{max}) < t_{WHQX}(\text{min})$

**Figure 3.4 Write Cycle Timing 1 ( $\overline{W}$  Controlled)**

**Table 3.5 Write Cycle Timing 2 ( $\bar{E}$  Controlled)<sup>1</sup>**

| Parameter  | Symbol                               | Min | Max | Unit |
|--|--------------------------------------|-----|-----|------|
| Write cycle time <sup>2</sup>                        | $t_{AVAV}$                           | 35  | -   | ns   |
| Address set-up time                                  | $t_{A\bar{V}EL}$                     | 0   | -   | ns   |
| Address valid to end of write ( $\bar{G}$ high)      | $t_{A\bar{V}EH}$                     | 18  | -   | ns   |
| Address valid to end of write ( $\bar{G}$ low)       | $t_{A\bar{V}EH}$                     | 20  | -   | ns   |
| Enable to end of write ( $\bar{G}$ high)             | $t_{E\bar{L}EH}$<br>$t_{E\bar{L}WH}$ | 15  | -   | ns   |
| Enable to end of write ( $\bar{G}$ low) <sup>3</sup> | $t_{E\bar{L}EH}$<br>$t_{E\bar{L}WH}$ | 15  | -   | ns   |
| Data valid to end of write                           | $t_{D\bar{V}EH}$                     | 10  | -   | ns   |
| Data hold time                                       | $t_{E\bar{H}DX}$                     | 0   | -   | ns   |
| Write recovery time                                  | $t_{E\bar{H}AX}$                     | 12  | -   | ns   |

<sup>1</sup> All write occurs during the overlap of  $\bar{E}$  low and  $\bar{W}$  low. Power supplies must be properly grounded and decoupled and bus contention conditions must be minimized or eliminated during read and write cycles. If  $\bar{G}$  goes low at the same time or after  $\bar{W}$  goes low, the output will remain in a high impedance state. After  $\bar{W}$ ,  $\bar{E}$  or  $\bar{UB}/\bar{LB}$  has been brought high, the signal must remain in steady-state high for a minimum of 2 ns. The minimum time between  $\bar{E}$  being asserted low in one cycle to  $\bar{E}$  being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.

<sup>2</sup> All write cycle timings are referenced from the last valid address to the first transition address.

<sup>3</sup> If  $\bar{E}$  goes low at the same time or after  $\bar{W}$  goes low, the output will remain in a high-impedance state. If  $\bar{E}$  goes high at the same time or before  $\bar{W}$  goes high, the output will remain in a high-impedance state.

**Figure 3.5 Write Cycle Timing 2 ( $\bar{E}$  Controlled)**

| fff | 0.08                            |

Not To Scale

1. Dimensions in Millimeters.
2. The 'e' represents the basic solder ball grid pitch.
- ③ 'b' is measurable at the maximum solder ball diameter in a plane parallel to datum C.
- ④ Dimension 'ddd' is measured parallel to primary datum C.
- ⑤ Primary datum C (seating plane) is defined by the crowns of the solder balls.
6. Package dimensions refer to JEDEC MO-205 Rev. G.

## 6. REVISION HISTORY

| Revision | Date               | Description of Change   |
|----------|--------------------|---|
| 1        | May 29, 2009       | Establish Speed and Power Specifications  |
| 2        | July 27, 2009      | Increase BGA Package to 11 mm x 11 mm   |
| 3        | May 5, 2010        | Changed speed marking and timing specs to 35 ns part. Changed BGA package to 10 mm x 10mm |
| 4        | Aug 10, 2011       | Max. magnetic field during write ( $H_{\text{max write}}$ ) increased to 8000 A/m.        |
| 5        | March 1, 2012      | Added preliminary information on AEC-Q100 Grade 1.  |
| 6        | September 20, 2013 | Replaced missing $V_{\text{OH}}$ specification line in Table 2.3.                         |
| 7        | April 25, 2014     | AEC-Q100 removed until qualified product is available.                                    |
| 8        | September 17, 2014 | 48-BGA package options moisture sensitivity level upgraded to MSL-5.                      |
| 8.1      | May 19, 2015       | Revised Everspin contact information.   |
| 8.2      | June 11, 2015      | Corrected Japan Sales Office telephone number.  |
| 8.3      | July 29, 2015      | Minor correction to the 'ddd' tolerance value for the BGA Package (Note 4.)               |
| 8.4      | March 11, 2016     | The BGA package moisture sensitivity level rating is changed to MSL-6 in Table 4.1.       |
| 8.5      | November 22, 2016  | The BGA package moisture sensitivity level rating is changed to MSL-5 in Table 4.1.       |
| 8.6      | May 9, 2017        | The BGA package moisture sensitivity level is upgraded to MSL-3                           |
| 8.7      | March 23, 2018     | Updated the Contact Us table  |

## 7. HOW TO CONTACT US

### How to Reach Us:

### Everspin Technologies, Inc.

Information in this document is provided solely to enable system and software implementers to use Everspin Technologies products. There are no express or implied licenses granted hereunder to design or fabricate any integrated circuit or circuits based on the information in this document. Everspin Technologies reserves the right to make changes without further notice to any products herein. Everspin makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Everspin Technologies assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters, which may be provided in Everspin Technologies data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters including "Typicals" must be validated for each customer application by customer's technical experts. Everspin Technologies does not convey any license under its patent rights nor the rights of others. Everspin Technologies products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Everspin Technologies product could create a situation where personal injury or death may occur. Should Buyer purchase or use Everspin Technologies products for any such unintended or unauthorized application, Buyer shall indemnify and hold Everspin Technologies and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Everspin Technologies was negligent regarding the design or manufacture of the part.
