MAX4754A Evaluation Kit

Quick Start

Recommended Equipment

- One +5V DC power supply
- One ohmmeter

Procedure

The MAX4754A EV kit is fully assembled and tested. Follow the steps below to verify board operation.

Caution: Do not turn on the power supply until all connections are completed.

- 1) Turn off the 5V DC power supply.
- 2) Make sure the shunts of all jumpers are in the following default positions:
 JU1: (1-2) INA is high
 JU2: (1-2) INB is high
- 3) Connect the (-) terminal of the 5V DC power supply to any GND pad of the MAX4754A EV kit. Connect the (+) terminal to the VDD pad.
- 4) Connect one terminal of the ohmmeter to the COM1 pad of the MAX4754A EV kit. Connect the other terminal of the ohmmeter to the NC1 pad.
- 5) Turn on the 5V DC power supply.
- 6) Remove the shunt of jumper JU1, then put it back on; observe the display difference of the ohmmeter during the jumper changing

Table 1. Jumper JU1 Configuration

JUMPER	SHUNT POSITION	DESCRIPTION
JU1	1-2*	INA is logic-high
	Open	INA is logic-low

*Default position.

Detailed Description of Hardware

The MAX4754A is a 0.5Ω, quad SPDT switch with dual control lines. The MAX4754A EV kit board provides a proven layout for evaluating the MAX4754A. The EV kit comes with a MAX4754AETE+ installed.

Switch Control

There are two jumpers (JU1 and JU2) on the MAX4754A EV kit board, which individually control the logic level of the digital control inputs INA and INB, as shown in Tables 1 and 2. Refer to the MAX4754A data sheet for a detailed description of the switching function.

Power Supply

The MAX4754A EV kit is powered from a user-supplied +1.8V to +5.5V DC power supply connected to the VDD and GND pads.

Table 2. Jumper JU2 Configuration

JUMPER	SHUNT POSITION	DESCRIPTION
JU2	1-2*	INB is logic-high
	Open	INB is logic-low

*Default position.
