

FEATURES

Meets and exceeds EIA RS-485 and EIA RS-422 standards
30 Mbps data rate
Recommended for PROFIBUS applications
2.1 V minimum differential output with 54 Ω termination
Low power 0.8 mA I_{CC}
Thermal shutdown and short-circuit protection
0.5 ns skew driver and receiver
Driver propagation delay: 11 ns
Receiver propagation delay: 12 ns
High impedance outputs with drivers disabled or power off
Superior upgrade for SN65ALS1176
Available in standard 8-lead SOIC package

APPLICATIONS

Industrial field equipment

GENERAL DESCRIPTION

The ADM1486 is a differential line transceiver suitable for high speed bidirectional data communication on multipoint bus transmission lines. It is designed for balanced data transmission, complies with EIA Standards RS-485 and RS-422, and is recommended for PROFIBUS applications. The part contains a differential line driver and a differential line receiver. Both the driver and the receiver may be enabled independently. When disabled or powered down, the driver outputs are high impedance.

The ADM1486 operates from a single 5 V power supply. Excessive power dissipation caused by bus contention or output shorting is prevented by short-circuit protection and thermal circuitry. Short-circuit protection circuits limit the maximum output current to ± 200 mA during fault conditions. A thermal shutdown circuit senses if the die temperature rises above 150°C and forces the driver outputs into a high impedance state under this condition.

Up to 50 transceivers may be connected simultaneously on a bus, but only one driver should be enabled at a time. Therefore, it is important that the remaining disabled drivers do not load the bus.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

To ensure this, the ADM1486 driver features high output impedance when disabled and when powered down. This minimizes the loading effect when the transceiver is not being used. The high impedance driver output is maintained over the entire common-mode voltage range from -7 V to $+12$ V.

The receiver contains a fail-safe feature that results in a logic high output state if the inputs are unconnected (floating).

The ADM1486 is fabricated on BiCMOS, an advanced mixed technology process combining low power CMOS with fast switching bipolar technology. All inputs and outputs contain protection against ESD; all driver outputs feature high source and sink current capability. An epitaxial layer is used to guard against latch-up.

The ADM1486 features extremely fast and closely matched switching, enable, and disable times. Minimal driver propagation delays permit transmission at data rates up to 30 Mbps while low skew minimizes EMI interference.

The part is fully specified over the commercial and industrial temperature range and is available in an 8-lead SOIC package.

SPECIFICATIONS

$V_{CC} = 5\text{ V} \pm 5\%$. All specifications T_{MIN} to T_{MAX} , unless otherwise noted.

Table 1.

Parameter	Min	Typ	Max	Unit	Test Conditions/Comments
DRIVER					
Differential Output Voltage, V_{OD}			5.0	V	R = Infinity, see Figure 3
	2.1		5.0	V	$V_{CC} = 5\text{ V}$, R = 50 Ω (RS-422), see Figure 3
	2.1		5.0	V	R = 27 Ω (RS-485), see Figure 3
V_{OD3}	2.1		5.0	V	$V_{TST} = -7\text{ V}$ to $+12\text{ V}$, see Figure 4
$\Delta V_{OD} $ for Complementary Output States			0.2	V	R = 27 Ω or 50 Ω , see Figure 3
Common-Mode Output Voltage V_{OC}			3.0	V	R = 27 Ω or 50 Ω , see Figure 3
$\Delta V_{OC} $ for Complementary Output States			0.2	V	R = 27 Ω or 50 Ω
Output Short-Circuit Current ($V_{OUT} = \text{High}$)	60		200	mA	$-7\text{ V} \leq V_O \leq +12\text{ V}$
Output Short-Circuit Current ($V_{OUT} = \text{Low}$)	60		200	mA	$-7\text{ V} \leq V_O \leq +12\text{ V}$
CMOS Input Logic Threshold Low, V_{INL}			0.8	V	
CMOS Input Logic Threshold High, V_{INH}	2.0			V	
Logic Input Current (DE, DI)			± 1.0	μA	
RECEIVER					
Differential Input Threshold Voltage, V_{TH}	-0.2		+0.2	V	$-7\text{ V} \leq V_{CM} \leq +12\text{ V}$
Input Voltage Hysteresis, ΔV_{TH}		70		mV	$V_{CM} = 0\text{ V}$
Input Resistance	20	30		k Ω	$-7\text{ V} \leq V_{CM} \leq +12\text{ V}$
Input Current (A, B)			0.6	mA	$V_{IN} = +12\text{ V}$
			-0.35	mA	$V_{IN} = -7\text{ V}$
Logic Enable Input Current (\overline{RE})			± 1.0	μA	
CMOS Output Voltage Low, V_{OL}			0.4	V	$I_{OUT} = +4.0\text{ mA}$
CMOS Output Voltage High, V_{OH}	4.0			V	$I_{OUT} = -4.0\text{ mA}$
Short-Circuit Output Current	7		85	mA	$V_{OUT} = \text{GND}$ or V_{CC}
Three-State Output Leakage Current			± 1.0	μA	$0.4\text{ V} \leq V_{OUT} \leq 2.4\text{ V}$
POWER SUPPLY CURRENT					
I_{CC} (Outputs Enabled)		1.2	2.0	mA	Outputs unloaded, digital inputs = GND or V_{CC}
I_{CC} (Outputs Disabled)		0.8	1.5	mA	Outputs unloaded, digital inputs = GND or V_{CC}

TIMING SPECIFICATIONS

$V_{CC} = 5\text{ V} \pm 5\%$. All specifications T_{MIN} to T_{MAX} , unless otherwise noted.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 3.

Parameter	Rating
V_{CC}	7 V
Inputs	
Driver Input (DI)	$-0.3\text{ V to }V_{CC} + 0.3\text{ V}$
Control Inputs (DE, \overline{RE})	$-0.3\text{ V to }V_{CC} + 0.3\text{ V}$
Receiver Inputs (A, B)	$-9\text{ V to }+14\text{ V}$
Outputs	
Driver Outputs	$-9\text{ V to }+14\text{ V}$
Receiver Outputs	$-0.5\text{ V to }V_{CC} + 0.5\text{ V}$
Power Dissipation 8-Lead SOIC	450 mW
θ_{JA} , Thermal Impedance	170°C/W
Operating Temperature Range	
Industrial (A Version)	$-40^\circ\text{C to }+85^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Lead Temperature (Soldering, 10 sec)	300°C
Vapor Phase (60 sec)	215°C
Infrared (15 sec)	220°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	RO	Receiver Output. When enabled, if $A > B$ by 200 mV, RO = high. If $A < B$ by 200 mV, RO = low.
2	\overline{RE}	Receiver Output Enable. A low level enables the receiver output, RO. A high level places it in a high impedance state.
3	DE	Driver Output Enable. A high level enables the driver differential outputs, A and B. A low level places it in a high impedance state.
4	DI	Driver Input. When the driver is enabled, a logic low on DI forces A low and B high, while a logic high on DI forces A high and B low.
5	GND	Ground Connection, 0 V.
6	A	Noninverting Receiver Input A/Driver Output A.
7	B	Inverting Receiver Input B/Driver Output B.
8	V _{CC}	Power Supply, 5 V \pm 5%.

APPLICATIONS INFORMATION

DIFFERENTIAL DATA TRANSMISSION

Differential data transmission is used to reliably transmit data at high rates over long distances and through noisy environments. Differential transmission nullifies the effects of ground shifts and noise signals that appear as common-mode voltages on the line. There are two main standards approved by the Electronics Industries Association (EIA) that specify the electrical characteristics of transceivers used in differential data transmission.

The RS-422 standard specifies data rates up to 10 MBaud and line lengths up to 4,000 feet. A single driver can drive a transmission line with up to 10 receivers.

In order to address true multipoint communications, the RS-485 standard was defined. This standard meets or exceeds all of the requirements of RS-422, and it allows up to 32 drivers and 32 receivers to connect to a single bus. An extended common-mode range of -7 V to $+12\text{ V}$ is defined. The most significant difference between the RS-422 and the RS-485 is that the drivers with RS-485 can be disabled, allowing more than one driver to be connected to a single line; in fact, 32 drivers can be connected to a single line. Only one driver should be enabled at a time, but the RS-485 standard contains additional specifications to guarantee device safety in the event of line contention.

CABLE AND DATA RATE

Twisted pair is the transmission line of choice for RS-485 communications. Twisted pair cable tends to cancel common-mode noise and causes cancellation of the magnetic fields generated by the current flowing through each wire, thereby reducing the effective inductance of the pair.

The ADM1486 is designed for bidirectional data communications on multipoint transmission lines. A typical application showing a multipoint transmission network is shown in Figure 33.

An RS-485 transmission line can have as many as 32 transceivers on the bus. Only one driver can transmit at a time, but multiple receivers may be enabled simultaneously.

As with any transmission line, it is important to minimize reflections. This can be achieved by terminating the extreme ends of the line using resistors equal to the characteristic impedance of the line. Stub lengths of the main line should also be kept as short as possible. A properly terminated transmission line appears purely resistive to the driver.

THERMAL SHUTDOWN

The ADM1486 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. Thermal sensing circuitry detects the increase in die temperature and disables the driver outputs. Thermal sensing circuitry is designed to disable the driver outputs when a die temperature reaches 150°C . As the device cools, the drivers are re-enabled at 140°C .

PROPAGATION DELAY

The ADM1486 features very low propagation delay, ensuring maximum baud rate operation. The well-balanced driver ensures distortion-free transmission.

Another important specification is a measure of the skew between the complementary outputs. Excessive skew impairs the noise immunity of the system and increases the amount of electromagnetic interference (EMI).

RECEIVER OPEN-CIRCUIT FAIL-SAFE

The receiver input includes a fail-safe feature that guarantees a logic high on the receiver when the inputs are open circuit or floating.
