 5 to 35°C of temperature, 45 to 85% relative humidity and 86 to 106kPa of air pressure.

When there are questions concerning measurement result :

In order to provide correlation data, the test shall be conducted under condition of 20±2°C of temperature, 60 to 70% relative humidity and 86 to 106kPa of air pressure.

Unless otherwise specified, all the tests are conducted under the “standard condition”.

【Reflow Profile】

Technical considerations

※ Components should be preheated to within 100 to 130°C from soldering temperature.  
※ Assured to be reflow soldering for 2 times.  
Note : The above profiles are the maximum allowable soldering condition, therefore these profiles are not always recommended.

3. Storage conditions	
Precautions	<p>◆Storage</p> <p>1. To maintain the solderability of terminal electrodes and to keep the packaging material in good condition, care must be taken to control temperature and humidity in the storage area. Humidity should especially be kept as low as possible.</p> <ul style="list-style-type: none"> <li>Recommended conditions           <p>Ambient temperature : <math>-20\sim+40^{\circ}\text{C}</math></p> <p>Humidity : Below 70%RH</p> <p>The ambient temperature must be kept below <math>30^{\circ}\text{C}</math>.</p> <p>Even under ideal storage conditions, the solderability of electrodes decreases gradually, so filters should be mounted within 6 months from the time of delivery.</p> </li> <li>The packaging material should be kept where no chlorine or sulfur exists in the air.</li> </ul>
Technical considerations	<p>◆Storage</p> <p>1. If the parts are stocked in a high temperature and humidity environment, problems such as reduced solderability caused by oxidation of terminal electrodes and deterioration of taping/ packaging materials may take place. For this reason, components should be used within 6 months from the time of delivery. If exceeding the above period, please check the solderability before using the filter.</p>
